Monitoring ParametersLFTs (eg, AST and ALT) periodically during therapy and for several months following discontinuation of therapy; renal function prior to initiation and periodically during treatment; signs and symptoms of peripheral neuropathy (eg, weakness, paresthesia, leg pain) or myopathy (eg, unexplained muscle pain, tenderness or weakness); serum creatine kinase)

Nursing: Physical Assessment/MonitoringUse caution in presence of impaired hepatic or renal function. Assess potential for interactions with other pharmacological agents patient may be taking. Assess results of laboratory tests (eg, LFTs, renal function, and serum creatinine kinase) prior to therapy, periodically during therapy, and for several months following discontinuation. Assess therapeutic effectiveness (suppression of HBV DNA) and adverse reactions on a regular basis throughout therapy (eg, peripheral neuropathy or myopathy [may be necessary to discontinue drug], gastrointestinal effects [pain or vomiting], upper respiratory infection). Patients should be assessed for several months following discontinuation of therapy for possible clinical exacerbations. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLFTs (eg, AST and ALT) periodically during therapy and for several months following discontinuation of therapy; renal function prior to initiation and periodically during treatment; serum creatine kinase

Patient EducationDo not take any new prescription or OTC medications, or herbal products during therapy without consulting prescriber. This medication does not stop you from spreading HBV to others; consult prescriber about safe sex practices and do not share needles or personal items that may have blood or body fluids on them. Take as directed with or without food. Do not discontinue without consulting prescriber (symptoms may worsen and/or become very serious). Avoid alcohol (may increase potential for liver damage. Maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake). This medication may be prescribed with a combination of other medications; time these medications as directed by prescriber. Frequent blood tests may be required with prolonged therapy. May cause nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); dizziness or fatigue (use caution when driving or engaging in tasks that require alertness until response to drug is known); headache, fever, or muscle pain (an analgesic may be recommended). Report immediately any signs of lactic acidosis (eg, persistent lethargy or fatigue, unusual muscle pain or weakness, feel cold [especially in arms and legs], rapid or irregular heart beat, or difficulty breathing) or liver toxicity (eg, yellowing of eyes or skin, pale stool and dark urine); upper respiratory infection or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tyzeka™: 600 mg

Generic AvailableNo
ManufacturerNovartis Pharma
Pricing: U.S. (www.drugstore.com)

Tablets (Tyzeka)

600 mg (30): $633.22

Mechanism of ActionTelbivudine, a synthetic thymidine nucleoside analogue (L-enantiomer of thymidine), is intracellularly phosphorylated to the active triphosphate form, which competes with the natural substrate, thymidine 5'-triphosphate, to inhibit hepatitis B viral DNA polymerase; enzyme inhibition blocks reverse transcriptase activity thereby reducing viral DNA replication.

Pharmacodynamics/Kinetics

Distribution: V_d > total body water

Protein binding: 3%

Metabolism: No metabolites detected

Half-life elimination: Terminal: 40-49 hours

Time to peak, plasma: 1-4 hours

Excretion: Urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusFatigue and malaise are common; may cause dizziness or insomnia
Mental Health: Effects on Psychiatric TreatmentMay cause myopathy with serum creatine kinase elevations, weeks to months after initiation; consider this when evaluating patients for neuroleptic malignant syndrome and malignant hyperthermia. May cause neutropenia; use caution with clozapine and carbamazepine.
Index TermsL-Deoxythymidine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tel ith roe MYE sin)

U.S. Brand NamesKetek®

Canadian Brand NamesKetek®

Pharmacologic CategoryAntibiotic, Ketolide

Use: Labeled IndicationsTreatment of community-acquired pneumonia (mild-to-moderate) caused by susceptible strains of *Streptococcus pneumoniae* (including multidrug-resistant isolates), *Haemophilus influenzae*, *Chlamydophila pneumoniae*, *Moraxella catarrhalis*, and *Mycoplasma pneumoniae*

Dosing: Adults

Community-acquired pneumonia: Oral: 800 mg once daily for 7-10 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricTonsillitis/pharyngitis (unlabeled use; Canadian indication): Children ≥13 years: Oral: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute, including dialysis:

U.S. product labeling: 600 mg once daily; when renal impairment is accompanied by hepatic impairment, reduce dosage to 400 mg once daily

Canadian product labeling: Reduce dose to 400 mg once daily

Hemodialysis: Administer following dialysis

Dosing: Hepatic ImpairmentNo adjustment recommended, unless concurrent severe renal impairment is present.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved Medication Guide is available and must be dispensed with every prescription. Copies may be found at: http://www.fda.gov/cder/foi/label/2007/021144s012medg.pdf

ContraindicationsHypersensitivity to telithromycin, macrolide antibiotics, or any component of the formulation; myasthenia gravis; history of hepatitis and/or jaundice associated with telithromycin or other macrolide antibiotic use; concurrent use of cisapride or pimozide

Allergy Considerations

- Macrolide Allergy

Warnings/Precautions

Boxed warnings:

- Myasthenia gravis: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May prolong QT_c interval, leading to a risk of ventricular arrhythmias; closely-related antibiotics have been associated with malignant ventricular arrhythmias and torsade de pointes. Avoid in patients with prolongation of QTc interval due to congenital causes, history of long QT syndrome, uncorrected electrolyte disturbances (hypokalemia or hypomagnesemia), significant bradycardia (<50 bpm), or concurrent therapy with QT_c-prolonging drugs (eg, class Ia and class III antiarrhythmics). Avoid use in patients with a prior history of confirmed cardiogenic syncope or ventricular arrhythmias while receiving macrolide antibiotics or other QT_c-prolonging drugs.

- Hepatic effects: Acute hepatic failure and severe liver injury, including hepatitis and hepatic necrosis (leading to some fatalities) have been reported, in some cases after only a few doses; if signs/symptoms of hepatitis or liver damage occur, discontinue therapy and initiate liver function tests.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea and pseudomembranous colitis.

- Syncope: May cause loss of consciousness (possibly vagal-related); caution patients that these events may interfere with ability to operate machinery or drive, and to use caution until effects are known.

- Visual disturbances: May cause severe visual disturbances (eg, changes in accommodation ability, diplopia, blurred vision).

Disease-related concerns:

- Myasthenia gravis: **[U.S. Boxed Warning]: Life-threatening (including fatal) respiratory failure has occurred in patients with myasthenia gravis;** use in these patients is contraindicated.

- Renal impairment: Use with caution in patients with renal impairment; severe impairment (Cl_{cr} <30 mL/minute) requires dosage adjustment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <13 years of age per Canadian approved labeling and <18 years of age per U.S. approved labeling.

Geriatric ConsiderationsBioavailability (57%) equivalent in persons ≥65 years compared to younger adults; although a 1.4- to 2-fold increase in AUC found in older adults. No dosage adjustment required.

Pregnancy Risk FactorC

Pregnancy ConsiderationsBecause adverse effects were observed in some animal studies, telithromycin is classified pregnancy category C. There are no adequate and well-controlled studies of telithromycin in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if telithromycin is excreted in breast milk. The manufacturer recommends caution if using telithromycin in a breast-feeding woman.

Pregnancy & Lactation, In-Depth

- Telithromycin in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (10% to 11%)

2% to 10%:

Central nervous system: Headache (2% to 6%), dizziness (3% to 4%)

Gastrointestinal: Nausea (7% to 8%), vomiting (2% to 3%), loose stools (2%), dysgeusia (2%)

≥0.2% to <2%:

Central nervous system: Fatigue, insomnia, somnolence, vertigo

Dermatologic: Rash

Gastrointestinal: Abdominal distension, abdominal pain, anorexia, constipation, dyspepsia, flatulence, gastritis, gastroenteritis, GI upset, glossitis, stomatitis, watery stools, xerostomia

Genitourinary: Vaginal candidiasis, vaginitis

Hematologic: Platelets increased

Hepatic: Transaminases increased

Ocular: Blurred vision, accommodation delayed, diplopia

Miscellaneous: Candidiasis, diaphoresis increased

<0.2%: Alkaline phosphatase increased, anxiety, bilirubin increased, bradycardia, eczema, eosinophilia, erythema multiforme, flushing, hepatitis, hypotension, jaundice, paresthesia, pruritus, urticaria

Postmarketing and/or case reports: Acute repiratory failure, allergic reaction, anaphylaxis, angioedema, arrhythmia, edema (facial), hepatocellular injury (including necrosis), liver failure, loss of consciousness (may be vagal-related), muscle cramps, myasthenia gravis exacerbation (rare), pancreatitis, palpitation, pseudomembranous colitis, QT_c prolongation, syncope, torsade de pointes

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak), 3A4 (strong)

Drug Interactions

Alfentanil: Macrolide Antibiotics may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Macrolide Antibiotics may decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Macrolide Antibiotics may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Macrolide Antibiotics may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Macrolide Antibiotics may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Macrolide Antibiotics may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Macrolide Antibiotics may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Macrolide Antibiotics may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clopidogrel: Macrolide Antibiotics may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clozapine: Macrolide Antibiotics may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Colchicine: Macrolide Antibiotics may decrease the metabolism of Colchicine. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Macrolide Antibiotics may decrease the metabolism of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Macrolide Antibiotics may enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. *Risk X: Avoid combination*

Eletriptan: Macrolide Antibiotics may decrease the metabolism of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Macrolide Antibiotics may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Macrolide Antibiotics may enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Cabergoline. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Macrolide Antibiotics may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Phosphodiesterase 5 Inhibitors: Macrolide Antibiotics may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Macrolide Antibiotics may decrease the metabolism of Pimozide. QTc prolongation is a risk. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Macrolide Antibiotics may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Macrolide Antibiotics may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: Macrolide Antibiotics may decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Rifapentine. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: Macrolide Antibiotics may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Fluvoxamine; PARoxetine. *Risk C: Monitor therapy*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Macrolide Antibiotics may decrease the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: Macrolide Antibiotics may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Zopiclone: Macrolide Antibiotics may increase the serum concentration of Zopiclone. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/nutraceutical: St John's wort: May decrease the levels/effects of telithromycin.

Monitoring ParametersLiver function tests; signs/symptoms of liver failure (eg, jaundice, fatigue, malaise, anorexia, nausea, bilirubinemia, acholic stools, liver tenderness, hepatomegaly); visual acuity

Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and previous experience with telithromycin or macrolide antibiotics prior to therapy. Assess patient for contraindications (history of hepatic dysfunction, myasthenia gravis, uncorrected electrolyte imbalance, history of prolonged QT interval). Assess for potential interactions with other pharmacologic agents patient may be using that may increase potential for adverse interactions. Assess results of laboratory tests (LFTs), therapeutic effectiveness (resolution of infection), and adverse reactions (eg, hepatic necrosis or failure, gastrointestinal disturbance [nausea, vomiting, diarrhea], CNS [vertigo, insomnia], rash, opportunistic infection, QT prolongation) during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (especially any signs of jaundice or hepatic impairment).

Monitoring: Lab TestsCulture and sensitivity; liver function tests

Patient EducationYou will receive a medication guide with your prescription; read this information completely. Do not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. Take as directed, with or without food. Do not chew or crush tablets. Take complete prescription even if you are feeling better. May cause headache, dizziness, insomnia, blurred visions, or difficulty focusing (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or loss of appetite (frequent small meals and frequent mouth care may help); diarrhea; or watery stools (boiled milk, buttermilk, or yogurt may help - consult prescriber if persistent). If you experience visual difficulties, loss of consciousness (fainting), dark urine, pale stool, or yellowing of skin or eyes, contact prescriber immediately before taking another dose. Report chest pain, palpitations, irregular heart beat; flushing or facial swelling; CNS disturbance (dizziness, headache, anxiety, abnormal dreams, tremor); unusual muscle weakness; skin rash; vaginal itching, burning, or discharge; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Ketek®: 300 mg [not available in Canada], 400 mg

Generic AvailableNo

ManufacturerAventis Pharma (Canada)

Pricing: U.S. (www.drugstore.com)

Tablets (Ketek)

400 mg (60): $311.99

Tablets (Ketek Pak)

400 mg (10): $57.20

Mechanism of ActionInhibits bacterial protein synthesis by binding to two sites on the 50S ribosomal subunit. Telithromycin has also been demonstrated to alter secretion of IL-1alpha and TNF-alpha; the clinical significance of this immunomodulatory effect has not been evaluated.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: 2.9 L/kg

Protein binding: 60% to 70%; primarily to albumin

Metabolism: Hepatic, via CYP3A4 (50%) and non-CYP-mediated pathways

Bioavailability: 57% (significant first-pass metabolism)

Half-life elimination: 10 hours

Time to peak, plasma: 1 hour

Excretion: Urine (13% unchanged drug, remainder as metabolites); feces (7%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), glossitis, stomatitis, and tooth discoloration.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsTelithromycin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness, fatigue, somnolence, or insomnia; may rarely cause nervousness, tremor, and abnormal dreams

Mental Health: Effects on Psychiatric TreatmentMay prolong QT_c interval; use caution with thioridazine and ziprasidone. Gastrointestinal side effects are common; these effects may be additive with concomitant use of SSRIs, lithium, and valproic acid. Telithromycin may increase the effects of alprazolam, carbamazepine, ergot alkaloids, midazolam, mirtazapine, nefazodone, pimozide, triazolam, and venlafaxine. Concomitant use with ergots, midazolam, pimozide, or triazolam is generally contraindicated. Nefazodone may increase the effects of telithromycin. Carbamazepine, phenobarbital, and phenytoin may decrease the effects of telithromycin.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tel mi SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesMicardis® HCT

Canadian Brand NamesMicardis® Plus

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension; combination product should not be used for initial therapy

Dosing: Adults**Hypertension:** Oral: Replacement therapy: Combination product can be substituted for individual titrated agents. Initiation of combination therapy when monotherapy has failed to achieve desired effects:

Patients currently on telmisartan: Initial dose if blood pressure is not currently controlled on monotherapy of 80 mg telmisartan: Telmisartan 80 mg/hydrochlorothiazide 12.5 mg once daily; may titrate up to telmisartan 160 mg/hydrochlorothiazide 25 mg if needed.

Patients currently on hydrochlorothiazide: Initial dose if blood pressure is not currently controlled on monotherapy of 25 mg once daily: Telmisartan 80 mg/hydrochlorothiazide 12.5 mg once daily or telmisartan 80 mg/hydrochlorothiazide 25 mg once daily; may titrate up to telmisartan 160 mg/hydrochlorothiazide 25 mg if blood pressure remains uncontrolled after 2-4 weeks of therapy. Patients who develop hypokalemia may be switched to telmisartan 80 mg/hydrochlorothiazide 12.5 mg.

Dosing: ElderlyRefer to adult dosing. Monitor renal function.

Dosing: Renal Impairment

Cl_{cr} >30 mL/minute: Usual recommended dose

Cl_{cr} ≤30 mL/minute: Not recommended

Dosing: Hepatic ImpairmentDosing should be started at telmisartan 40 mg/hydrochlorothiazide 12.5 mg. Do **not** use in patients with severe hepatic impairment.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be given with or without food.

StorageStore at 20°C (77°C). Protect from moisture. Do not remove from blister pack until needed.

ContraindicationsHypersensitivity to telmisartan, hydrochlorothiazide, or any component of the formulation; sulfonamide-derived drugs; anuria

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration of renal function and/or increases in serum creatinine, particularly in patients dependent on renin-angiotensin-aldosterone system; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use with caution in patients who have biliary obstructive disorders or hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use telmisartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use telmisartan with caution with pre-existing renal insufficiency and severe renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsNo dosing adjustment needed based on age. Monitor renal function.
Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)
Pregnancy Considerations

Telmisartan: C (1st trimester); D (2nd and 3rd trimesters): Discontinue as soon as possible when pregnancy is detected. Drugs that act directly on renin-angiotensin can cause fetal and neonatal morbidity and death. Adverse effects to the fetus appear to be limited to the 2nd and 3rd trimesters.

Hydrochlorothiazide: B (per manufacturer); D (based on expert analysis): Although there are no adequate and well-controlled studies using hydrochlorothiazide in pregnancy, thiazide diuretics may cause an increased risk of congenital defects. Hypoglycemia, hypokalemia, hyponatremia, jaundice, and thrombocytopenia are also reported as possible complications to the fetus or newborn.

LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsIt is not known if telmisartan is excreted in human breast milk, use during breast-feeding is not recommended. Thiazides are excreted in human breast milk; benefits to the mother should be weighed against possible risk to the newborn if used in a nursing woman.
Adverse ReactionsThe following reactions have been reported with the combination product; see individual agents for additional adverse reactions that may be expected from each agent.

2% to 10%:

Central nervous system: Dizziness (5%)

Gastrointestinal: Diarrhea (3%), nausea (2%)

Renal: BUN increased (3%)

Respiratory: Upper respiratory tract infection (8%), sinusitis (4%)

Miscellaneous: Flu-like syndrome (2%)

<2%: Abdominal pain, back pain, bilirubin increased, bronchitis, dyspepsia, hematocrit decreased, hemoglobin decreased, hypokalemia, liver enzymes increased, pharyngitis, postural hypotension, rash, serum creatinine increased, tachycardia, vomiting; rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists

Postmarketing and/or case reprots: Angioneurotic edema, atrial fibrillation, chest pain, cough, diaphoresis increased, erectile dysfunction, erythema, fatigue, headache, hyperkalemia, hypersensitivity, hypotension, muscle cramps, myalgia, MI, syncope, urinary tract infection, urticaria

Metabolism/Transport EffectsTelmisartan: **Inhibits** CYP2C19 (weak)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Telmisartan may increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may potentiate orthostatic hypotension).
Monitoring ParametersBlood pressure, serum electrolytes, BUN, creatinine, symptomatic hypotension, and tachycardia

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN]: Canadian brand name

Tablet:

Micardis® HCT [available in U.S.]:

40/12.5: Telmisartan 40 mg and hydrochlorothiazide 12.5 mg

80/12.5: Telmisartan 80 mg and hydrochlorothiazide 12.5 mg

80/25: Telmisartan 80 mg and hydrochlorothiazide 25 mg

Micardis® Plus [CAN]: 80/25: Telmisartan 80 mg and hydrochlorothiazide 25 mg [Not available in U.S.]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Micardis HCT)

40-12.5 mg (30): $79.70

80-12.5 mg (30): $87.35

80-25 mg (30): $93.89

Mechanism of Action

Telmisartan: Telmisartan is an angiotensin receptor antagonist. Angiotensin II acts as a vasoconstrictor. In addition to causing direct vasoconstriction, angiotensin II also stimulates the release of aldosterone. Once aldosterone is released, sodium as well as water are reabsorbed. The end result is an elevation in blood pressure. Telmisartan binds to the AT1 angiotensin II receptor. This binding prevents angiotensin II from binding to the receptor thereby blocking the vasoconstriction and the aldosterone secreting effects of angiotensin II.

Hydrochlorothiazide: Inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Hydrochlorothiazide
- Telmisartan

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause insomnia, anxiety, nervousness, or depression

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels. May cause photosensitivity; concomitant use with psychotropics may further the risk. Use sunscreen, wear protective clothing and eyewear and avoid direct sunlight.

Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Index TermsHydrochlorothiazide and Telmisartan

Pronunciation(tel mi SAR tan)

U.S. Brand NamesMicardis®

Canadian Brand NamesMicardis®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsTreatment of hypertension; may be used alone or in combination with other antihypertensive agents

Dosing: Adults**Hypertension:** Oral: Initial: 40 mg once daily; usual maintenance dose range: 20-80 mg/day. Patients with volume depletion should be initiated on the lower dosage with close supervision.

Dosing: ElderlyInitial: 20 mg/day; usual maintenance dose range: 20-80 mg/day

Dosing: Renal ImpairmentNo adjustment required; hemodialysis patients are more susceptible to orthostatic hypotension

Dosing: Hepatic ImpairmentSupervise patients closely.

Dietary ConsiderationsMay be taken without regard to food.

ContraindicationsHypersensitivity to telmisartan or any component of the formulation

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.
- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.
- Hepatic impairment: Use with caution in patients who have biliary obstructive disorders or hepatic dysfunction.
- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.
- Renal artery stenosis: Use telmisartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsNo initial dose adjustment is required. There appear to be no significant differences in response between the elderly and younger adults (limited data available). Monitor closely during initiation phase. Many elderly may be volume depleted due to diuretics and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

LactationEnters breast milk/not recommended

Adverse ReactionsMay be associated with worsening of renal function in patients dependent on renin-angiotensin-aldosterone system.

1% to 10%:

Cardiovascular: Hypertension (1%), chest pain (1%), peripheral edema (1%)

Central nervous system: Headache (1%), dizziness (1%), pain (1%), fatigue (1%)

Gastrointestinal: Diarrhea (3%), dyspepsia (1%), nausea (1%), abdominal pain (1%)

Genitourinary: Urinary tract infection (1%)

Neuromuscular & skeletal: Back pain (3%), myalgia (1%)

Respiratory: Upper respiratory infection (7%), sinusitis (3%), pharyngitis (1%), cough (2%)

<1% (Limited to important or life-threatening): Abdominal pain, abnormal ECG, abnormal vision, abscess, allergic reaction, anemia, angina, angioedema, angioneurotic edema, anxiety, arthralgia, arthritis, asthma, atrial fibrillation, back pain, bradycardia, bronchitis, BUN increased, cerebrovascular disorder, CHF, conjunctivitis, constipation, cramps, creatinine kinase increased, cystitis, depression, dermatitis, diabetes mellitus, diaphoresis, dry mouth, dyspnea, earache, eczema, edema, enteritis, epistaxis, eosinophilia, erythema, erectile dysfunction, erythema, facial edema, fever, flatulence, flushing, frequent urination, fungal infection, gastroenteritis, gout, hemoglobin decreased, hemorrhoids, hepatic dysfunction, hypercholesterolemia, hyperkalemia, hypersensitivity, hypotension, impotence, insomnia, liver enzymes increased, malaise, MI, migraine, muscle cramps, nervousness, orthostatic hypotension (more frequent in dialysis patients), otitis media, palpitation, paresthesia, pruritus, renal dysfunction, renal failure, rhabdomyolysis, rash, reflux, rhinitis, serum creatinine increased, somnolence, syncope, tachycardia, thrombocytopenia, tinnitus, toothache, uric acid increased, urticaria, vertigo, weakness

Metabolism/Transport Effects**Inhibits** CYP2C19 (weak)

Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Cardiac Glycosides: Telmisartan may increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersSupine blood pressure, electrolytes, serum creatinine, BUN, urinalysis, symptomatic hypotension, and tachycardia

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, increased risk of hypercalcemia or increased hypotensive effects). Assess results of laboratory tests, therapeutic effectiveness (reduced hypertension), and adverse response (eg, hypotension, diarrhea, URI, cough) on a regular basis during therapy. Teach patient proper use, need for regular blood pressure monitoring, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor electrolytes, serum creatinine, BUN, urinalysis, symptomatic hypotension, and tachycardia

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed and do not alter dose or discontinue without consulting prescriber. Monitor blood pressure on a regular basis at same time of day, as advised by prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or postural hypotension (use caution when rising from lying or sitting position or climbing stairs). Report unusual weight gain and swelling of ankles, hands, face, lips, throat, or tongue; persistent fatigue; dry cough or respiratory difficulty; palpitations or chest pain; CNS changes; GI disturbances; muscle or bone pain, cramping, or tremors; change in urinary pattern; changes in hearing or vision; or other adverse response. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 20 mg, 40 mg, 80 mg

Generic AvailableNo

ManufacturerBoehringer Ingelheim, Corp

Pricing: U.S. (www.drugstore.com)

Tablets (Micardis)

20 mg (28): $52.99

40 mg (30): $76.43

80 mg (30): $78.62

Mechanism of ActionAngiotensin II acts as a vasoconstrictor. In addition to causing direct vasoconstriction, angiotensin II also stimulates the release of aldosterone. Once aldosterone is released, sodium as well as water are reabsorbed. The end result is an elevation in blood pressure. Telmisartan is a nonpeptide AT1 angiotensin II receptor antagonist. This binding prevents angiotensin II from binding to the receptor thereby blocking the vasoconstriction and the aldosterone secreting effects of angiotensin II.

Pharmacodynamics/KineticsOrally active, not a prodrug

Onset of action: 1-2 hours

Peak effect: 0.5-1 hours

Duration: Up to 24 hours

Protein binding: >99.5%

Metabolism: Hepatic via conjugation to inactive metabolites; not metabolized via CYP

Bioavailability (dose dependent): 42% to 58%

Half-life elimination: Terminal: 24 hours

Excretion: Feces (97%)

Clearance: Total body: 800 mL/minute

Related Information

- Angiotensin Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue, may rarely cause insomnia, anxiety, nervousness, depression, or sedation

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance, resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Medication Safety Issues

Sound-alike/look-alike issues:

Temazepam may be confused with flurazepam, LORazepam

Restoril® may be confused with Vistaril®, Zestril®

Pronunciation(te MAZ e pam)

U.S. Brand NamesRestoril®

Canadian Brand NamesApo-Temazepam®; CO Temazepam; Dom-Temazepam; Gen-Temazepam; Novo-Temazepam; Nu-Temazepam; PHL-Temazepam; PMS-Temazepam; ratio-Temazepam; Restoril®

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsShort-term treatment of insomnia

Use: Unlabeled/InvestigationalTreatment of anxiety; adjunct in the treatment of depression; management of panic attacks

Dosing: Adults **Insomnia:** Oral: 15-30 mg at bedtime

Dosing: Elderly15 mg in elderly or debilitated patients

RestrictionsC-IV

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to temazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); narrow-angle glaucoma (not in product labeling, however, benzodiazepines are contraindicated); pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Hypnotic: Appropriate use: Should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness. A worsening of insomnia or the emergence of new abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsBecause of its lack of active metabolites, temazepam is recommended in the elderly when a benzodiazepine hypnotic is indicated. Hypnotic use should be limited to 10-14 days. If insomnia persists, the patient should be evaluated for etiology.
Pregnancy Risk FactorX
LactationEnters breast milk/not recommended (AAP rates “of concern”)
Adverse Reactions

1% to 10%:

Central nervous system: Confusion, dizziness, drowsiness, fatigue, anxiety, headache, lethargy, hangover, euphoria, vertigo

Dermatologic: Rash

Endocrine & metabolic: Decreased libido

Gastrointestinal: Diarrhea

Neuromuscular & skeletal: Dysarthria, weakness

Ocular: Blurred vision

Miscellaneous: Diaphoresis

<1%: Amnesia, anorexia, ataxia, back pain, blood dyscrasias, drug dependence, increased dreaming, menstrual irregularities, palpitation, paradoxical reactions, reflex slowing, tremor, vomiting

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Substrate** (minor) of CYP2B6, 2C9, 2C19, 3A4
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum levels may be increased by grapefruit juice.

Herb/Nutraceutical: St John's wort may decrease temazepam levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status
Reference RangeTherapeutic: 26 ng/mL after 24 hours
Nursing: Physical Assessment/MonitoringFor short-term use. Assess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction (long-term use can result in dependence, abuse, or tolerance) and periodically evaluate need for continued use. Be alert to possibility of anaphylaxis any time during therapy. After long-term use, taper dosage slowly when discontinuing. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions (eg, CNS depression) at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient

appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use.

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Drug may cause physical and/or psychological dependence. May take with food to decrease GI upset. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, lightheadedness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth or GI discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report CNS changes (confusion, depression, increased sedation, excitation, headache, abnormal thinking, insomnia, or nightmares, memory impairment, impaired coordination); muscle pain or weakness; respiratory difficulty; unusual swelling, especially on face or neck; persistent dizziness, chest pain, or palpitations; alterations in normal gait; vision changes; or ineffectiveness of medication. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 7.5 mg, 15 mg, 22.5 mg, 30 mg

Restoril®: 7.5 mg, 15 mg, 22.5 mg, 30 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Restoril)

7.5 mg (30): $267.50

15 mg (30): $291.02

22.5 mg (30): $270.95

30 mg (30): $262.60

Capsules (Temazepam)

15 mg (30): $12.99

30 mg (30): $13.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Distribution: V_d: 1.4 L/kg

Protein binding: 96%

Metabolism: Hepatic

Half-life elimination: 9.5-12.4 hours

Time to peak, serum: 2-3 hours

Excretion: Urine (80% to 90% as inactive metabolites)

Related Information

- Benzodiazepines
- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Temazepam is a short half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder. Temazepam is slowly absorbed; undergoes phase II metabolism and, therefore, is less likely to be effected in patients with hepatic dysfunction.

Cardiovascular Considerations Hypotension may result in orthostatic lightheadedness or syncope. Benzodiazepines, as a class, may depress respiration. These medications may often be prescribed for difficulty in sleeping but may exacerbate sleep-disordered breathing.

Anesthesia and Critical Care Concerns/Other Considerations Chronic use of this agent may increase perioperative benzodiazepine dose needed to achieve desired effect. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms. Benzodiazepines, as a class, may depress respiration; may exacerbate sleep-disordered breathing.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(te moe ZOE loe mide)

U.S. Brand NamesTemodar®

Canadian Brand NamesTemodal®; Temodar®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent (Triazene)

Use: Labeled IndicationsTreatment of adult patients with refractory anaplastic astrocytoma; newly-diagnosed glioblastoma multiforme

Use: Unlabeled/InvestigationalMetastatic melanoma

Dosing: AdultsOral (refer to individual protocols):

Anaplastic astrocytoma (refractory): Initial dose: 150 mg/m^2/day for 5 days; repeat every 28 days. Subsequent doses of 100-200 mg/m^2/day for 5 days per treatment cycle; based upon hematologic tolerance.

ANC <1000/mm^3 or platelets <50,000/mm^3 on day 22 or day 29 (day 1 of next cycle): Postpone therapy until ANC >1500/mm^3 and platelets >100,000/mm^3; reduce dose by 50 mg/m^2/day for subsequent cycle

ANC 1000-1500/mm^3 or platelets 50,000-100,000/mm^3 on day 22 or day 29 (day 1 of next cycle): Postpone therapy until ANC >1500/mm^3 and platelets >100,000/mm^3; maintain initial dose

ANC >1500/mm^3 and platelets >100,000/mm^3 on day 22 or day 29 (day 1 of next cycle): Increase dose to or maintain dose at 200 mg/m^2/day for 5 days for subsequent cycle

Glioblastoma multiforme (high-grade glioma):

Concomitant phase: 75 mg/m^2/day for 42 days with radiotherapy (60Gy administered in 30 fractions). **Note:** PCP prophylaxis is required during concomitant phase and should continue in patients who develop lymphocytopenia until recovery (common toxicity criteria [CTC] ≤1). Obtain weekly CBC.

ANC ≥1500/mm^3, platelet count ≥100,000/mm^3, and nonhematologic CTC ≤grade 1 (excludes alopecia, nausea/vomiting): Temodar® 75 mg/m^2/day may be continued throughout the 42-day concomitant period up to 49 days

Dosage modification:

ANC ≥500/mm^3 but <1500/mm^3**or** platelet count ≥10,000/mm^3 but <100,000/mm^3**or** nonhematologic CTC grade 2 (excludes alopecia, nausea/vomiting): Interrupt therapy

ANC <500/mm^3**or** platelet count <10,000/mm^3**or** nonhematologic CTC grade 3/4 (excludes alopecia, nausea/vomiting): Discontinue therapy

Maintenance phase (consists of 6 treatment cycles): Begin 4 weeks after concomitant phase completion. **Note:** Each subsequent cycle is 28 days (consisting of 5 days of drug treatment followed by 23 days without treatment). Draw CBC within 48 hours of day 22; hold next cycle and do weekly CBC until ANC >1500/mm^3 and platelet count >100,000/mm^3; dosing modification should be based on lowest blood counts and worst nonhematologic toxicity during the previous cycle.

Cycle 1: 150 mg/m^2/day for 5 days; repeat every 28 days

Dosage modification for next cycle:

ANC <1000/mm^3, platelet count <50,000/mm^3, or nonhematologic CTC grade 3 (excludes for alopecia, nausea/vomiting) during previous cycle: Decrease dose by 50 mg/m^2/day for 5 days, unless dose has already been lowered to 100 mg/m^2/day, then discontinue therapy.

If dose reduction <100 mg/m^2/day is required or nonhematologic CTC grade 4 (excludes for alopecia, nausea/vomiting), or if the same grade 3 nonhematologic toxicity occurs after dose reduction: Discontinue therapy

Cycle 2: 200 mg/m^2/day for 5 days every 28 days, unless prior toxicity, then refer to Dosage Modifications under “Cycle 1” and give adjusted dose for 5 days

Cycles 3-6: Continue with previous cycle's dose for 5 days every 28 days unless toxicity has occurred then, refer to Dosage Modifications under “Cycle 1” and give adjusted dose for 5 days

Metastatic melanoma (unlabeled use): 200 mg/m^2/day for 5 days every 28 days (for up to 12 cycles). For subsequent cycles reduce dose to 75% of the original dose for grade 3/4 hematologic toxicity and reduce the dose to 50% of the original dose for grade 3/4 nonhematologic toxicity.

Dosing: ElderlyRefer to adult dosing. **Note:** Patients ≥70 years of age had a higher incidence of grade 4 neutropenia and thrombocytopenia in the first cycle of therapy than patients <70 years of age.

Dosing: Renal ImpairmentCaution should be used when administered to patients with severe renal impairment (Cl_{cr} <36 mL/minute). Temozolomide has not been studied in dialysis patients.

Dosing: Hepatic ImpairmentCaution should be used when administering to patients with severe hepatic impairment.

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Adults

Administration: OralCapsules should not be opened or chewed but swallowed whole with a glass of water. May be administered on an empty stomach to reduce nausea and vomiting. Bedtime administration may be advised.

Dietary ConsiderationsThe incidence of nausea/vomiting is decreased when the drug is taken on an empty stomach.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedTemozolomide 10 mg/mL oral suspension: In a glass mortar, mix the contents of ten 100-mg capsules and 500 mg of povidine K-30 powder; add 25 mg anhydrous citric acid dissolved in 1.5 mL purified water; mix to form a paste; add 50 mL Ora-Plus® (add a small amount at first, mix, add balance); mix; transfer to amber plastic bottle; add enough Ora-Sweet® or Ora-Sweet® SF to bring a total volume of 100 mL by rinsing the mortar with small amounts of Ora-Sweet®; repeat rinsing 3 more times. The suspension is stable for 7 days at room temperature or 60 days refrigerated in plastic amber prescription bottles. **Note:** Use appropriate handling precautions during preparation.

Trissel LA, Yanping Z, and Koontz SE. "Temozolomide Stability in Extemporaneously Compounded Oral Suspension," *Int J Pharm Compounding*, 2006, 10(5):396-9.

ContraindicationsHypersensitivity to temozolomide or any component of the formulation; hypersensitivity to dacarbazine (since both drugs are metabolized to MTIC); pregnancy

Allergy Considerations

- Dacarbazine (DTIC)/Temozolomide Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Myelosuppression: May occur with use; an increased incidence has been reported in geriatric and female patients.
- Pneumonia: Pneumocystis *jiroveci* pneumonia (PCP) may occur; risk is increased in those receiving steroids or longer dosing regimens; PCP prophylaxis is required in patients receiving radiotherapy in combination with the 42-day temozolomide regimen.
- Secondary malignancies: Rare cases of myelodysplastic syndrome and secondary malignancies, including acute myeloid leukemia have been reported.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment.

Pregnancy Risk FactorD

Pregnancy ConsiderationsMay cause fetal harm when administered to pregnant women. Animal studies, at doses less than used in humans, resulted in numerous birth defects. Testicular toxicity was demonstrated in animal studies using smaller doses than recommended for cancer treatment. There are no adequate and well-controlled studies in pregnant women. Male and female patients should avoid pregnancy while receiving drug.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions**Note:** With CNS malignancies, it is difficult to distinguish between CNS adverse events caused by temozolomide versus the effects of progressive disease.

>10%:

Cardiovascular: Peripheral edema (11%)

Central nervous system: Fatigue (34% to 61%), headache (23% to 41%), seizure (6% to 23%), hemiparesis (18%), fever (13%), dizziness (5% to 12%), coordination abnormality (11%)

Dermatologic: Alopecia (55%), rash (8% to 13%)

Gastrointestinal: Nausea (49% to 53%; grades 3/4: 1% to 10%), vomiting (29% to 42%; grades 3/4: 2% to 6%), constipation (22% to 33%), anorexia (9% to 27%), diarrhea (10% to 16%)

Hematologic: Lymphopenia (grades 3/4: 55%), thrombocytopenia (grades 3/4: adults: 4% to 19%; children: 25%), neutropenia (grades 3/4: adults: 8% to 14%; children: 20%), leukopenia (grades 3/4: 11%)

Neuromuscular & skeletal: Weakness (7% to 13%)

Miscellaneous: Viral infection (11%)

1% to 10%:

Central nervous system: Amnesia (10%), insomnia (4% to 10%), somnolence (9%), ataxia (8%), paresis (8%), anxiety (7%), memory impairment (7%), depression (6%), confusion (5%)

Dermatologic: Pruritus (5% to 8%), dry skin (5%), radiation injury (2% maintenance phase after radiotherapy), erythema (1%)

Endocrine & metabolic: Hypercorticism (8%), breast pain (females 6%)

Gastrointestinal: Stomatitis (9%), abdominal pain (5% to 9%), dysphagia (7%), taste perversion (5%), weight gain (5%)

Genitourinary: Incontinence (8%), urinary tract infection (8%), urinary frequency (6%)

Hematologic: Anemia (grades 3/4: 4%)

Neuromuscular & skeletal: Paresthesia (9%), back pain (8%), abnormal gait (6%), arthralgia (6%), myalgia (5%)

Ocular: Blurred vision (5% to 8%), diplopia (5%), vision abnormality (visual deficit/vision changes 5%)

Respiratory: Pharyngitis (8%), upper respiratory tract infection (8%), cough (5% to 8%), sinusitis (6%), dyspnea (5%)

Miscellaneous: Allergic reaction (up to 3%)

Postmarketing and/or case reports: Anaphylaxis, aplastic anemia, erythema multiforme, myelodysplastic syndrome, opportunistic infection (eg, PCP), pancytopenia, secondary malignancies (including myeloid leukemia)

Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Food reduces rate and extent of absorption.
Monitoring ParametersCBC with differential and platelets (prior to each cycle; weekly during glioma concomitant phase treatment; at or within 48 hours of day 22 and weekly until ANC >1500/mm^3 for glioma maintenance and astrocytoma treatment)
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests (CBC) at recommended intervals. Evaluate effectiveness (reduction in symptoms) and adverse effects (eg, CNS effects [convulsions, fatigue, impaired coordination, ataxia], gastrointestinal disturbance [nausea, vomiting, constipation], myelosuppression, rash, opportunistic infection, vision disturbance, cough) on a regular basis throughout therapy. Teach patient proper use and timing, possible side effects, and appropriate interventions.
Monitoring: Lab TestsCBC with differential and platelets (prior to each cycle; weekly during glioma concomitant phase treatment; at or within 48 hours of day 22 and weekly until ANC >1500/mm^3 for glioma maintenance and astrocytoma treatment)
Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. Take exactly as directed, on an empty stomach 1 hour before or 2 hours after meals or at bedtime. Do not open, crush, or chew capsules; swallow whole with full 8 oz of water. (If capsule is accidentally broken, do not inhale powder; wash hands thoroughly if powder gets skin). May cause headache, dizziness, confusion, fatigue, anxiety, insomnia, or impaired coordination (use caution when driving or engaging in tasks requiring alertness until response to medication is known); nausea, vomiting, or loss of appetite (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help); or hot flashes (cool dark room or cold compresses may help). Report chest pain, palpitations, acute headache, unusual swelling of legs or feet; visual disturbances; unresolved GI problems (persistent nausea or vomiting); itching or burning on urination or vaginal discharge; acute joint, back, bone, or muscle pain or unusual weakness; difficulty breathing, cough, or signs of respiratory infection; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Temodar®: 5 mg, 20 mg, 100 mg, 140 mg, 180 mg, 250 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Capsules (Temodar)

5 mg (5): $54.18

20 mg (5): $160.98

100 mg (5): $776.95

100 mg (14): $2449.57

180 mg (14): $4335.77

250 mg (5): $2009.84

Mechanism of ActionLike dacarbazine, temozolomide is converted to the active alkylating metabolite MTIC [(methyl-triazene-1-yl)-imidazole-4-carboxamide]. Unlike dacarbazine, however, this conversion is spontaneous, nonenzymatic, and occurs under physiologic conditions in all tissues to which the drug distributes.

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: V_d: Parent drug: 0.4 L/kg; penetrates blood brain barrier; CSF levels are ~35% to 39% of plasma levels

Protein binding: 15%

Metabolism: Prodrug, hydrolyzed to the active form, MTIC; MTIC is eventually eliminated as CO_2 and 5-aminoimidazole-4-carboxamide (AIC), a natural constituent in urine

Bioavailability: 100%

Half-life elimination: Mean: Parent drug: 1.8 hours

Time to peak: Empty stomach: 1 hour

Excretion: Urine (~38%; parent drug 6%); feces 0.8%

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, dysphagia, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue, dizziness, amnesia, and insomnia are common; may cause somnolence, confusion, anxiety, depression

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common, use caution with clozapine and carbamazepine; nausea is very common, avoid use with SSRIs

Temsirolimus: Health Canada Issues Warning Concerning Hypersensitivity and Infusion Reactions - August 2008

Wyeth Canada, in conjunction with Health Canada, has issued a Dear Healthcare Professional letter concerning hypersensitivity and infusion related reactions associated with temsirolimus (Torisel™). To date there have been no serious postmarketing reports of this type in Canada, however, worldwide there have been 46 case reports including one fatality and six life-threatening reactions. Reported adverse events include loss of consciousness, hypotension, chest pain, dyspnea, apnea, and flushing. Although most reactions have occurred with initial dosing and frequently within minutes of starting the infusion, hypersensitivity reactions have also been reported with subsequent infusions.

Prior to temsirolimus infusion, it is recommended that patients be premedicated with a selective H_1-blocker (eg, diphenhydramine) and appropriate supportive care be readily available. Infusions should be interrupted immediately in any patient experiencing hypersensitivity or infusion related reactions and appropriate treatment administered accordingly. Patients in whom reinitiating therapy is considered beneficial, administration of an I.V. H_1-blocker and/or I.V. H_2-blocker (eg, famotidine) is recommended as well as reducing the infusion rate. Subsequent use of temsirolimus is contraindicated in any patient who has a history of or experiences an anaphylactic reaction associated with temsirolimus therapy, sirolimus therapy, or any component of the formulation.

Further information may be found at: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/torisel_hpc-cps-eng.p

Medication Safety Issues

Sound-alike/look-alike issues:

Temsirolimus may be confused with sirolimus, tacrolimus

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Temsirolimus, for the treatment of advanced renal cell cancer, is a flat dose (25 mg) and is not based on body surface area (BSA).

Pronunciation(tem sir OH li mus)

U.S. Brand NamesTorisel®

Canadian Brand NamesTorisel®

Pharmacologic CategoryAntineoplastic Agent, mTOR Kinase Inhibitor

Use: Labeled IndicationsTreatment of advanced renal cell cancer (RCC)

Dosing: Adults**Note:** For infusion reaction prophylaxis, premedicate with an H_1 antagonist (eg, diphenhydramine 25-50 mg I.V.) 30 minutes prior to infusion.

RCC: I.V.: 25 mg weekly

Dosage adjustment for concomitant CYP3A4 inhibitors/inducers:

CYP3A4 inhibitors: Dose reductions are likely to be needed when temsirolimus is administered concomitantly with a strong CYP3A4 inhibitor (an alternate medication for CYP3A4 enzyme inhibitors should be investigated first); in the event that temsirolimus must be administered concomitantly with a potent enzyme inhibitor, consider reducing temsirolimus to 12.5 mg/week with careful monitoring. (When a strong CYP3A4 inhibitor is discontinued; allow ~1 week to elapse prior to adjusting the temsirolimus upward to the dose used prior to initiation of the CYP3A4 inhibitor.)

CYP3A4 inducers: Concomitant administration with CYP3A4 inducers may require increased temsirolimus doses (alternatives to the enzyme-inducing agent should be utilized first); consider adjusting temsirolimus dose to 50 mg/week, with careful monitoring. (If the strong CYP3A4 enzyme inducer is discontinued, reduce the temsirolimus to the dose used prior to initiation of the CYP3A4 inducer.)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot studied in renal dysfunction, however, due to the minimal renal elimination (<5%), dosage adjustment for renal dysfunction is not recommended.

Hemodialysis: Has not been studied in hemodialysis patients.

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain hepatic dosing adjustment guidelines. Patients with AST >3 times ULN (>5 times ULN in the presence of liver metastases) and total bilirubin >1.5 times ULN were excluded from clinical trials. Temsirolimus is primarily cleared hepatically.

Dosing: Adjustment for Toxicity

Hematologic toxicity: ANC <1000/mm^3 or platelets <75,000/mm^3: Withhold treatment until resolves and reinitiate treatment with a 5 mg/week dose reduction; minimum dose: 15 mg/week if adjustment for toxicity is needed.

Nonhematologic toxicity: Any toxicity ≥grade 3: Withhold treatment until resolves to ≤grade 2; reinitiate treatment with a 5 mg/week dose reduction; minimum dose: 15 mg/week if adjustment for toxicity is needed.

Administration: I.V.Infuse over 30-60 minute via an infusion pump (preferred). Use non-DEHP containing administration tubing. Administer through an inline polyethersulfone filter ≤5 micron. Premedicate with an H_1 antagonist (eg, diphenhydramine 25-50 mg I.V. 30 minutes prior to infusion. Monitor during infusion; interrupt infusion for hypersensitivity/infusion reaction; monitor for 30-60 minutes; may reinitiate at a reduced infusion rate (over 60 minutes) with discretion, 30 minutes after administration of a histamine H_1 antagonist and/or a histamine H_2 antagonist (eg, famotidine or ranitidine).

StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Diluted solution in the vial (10 mg/mL) is stable for 24 hours at room temperature. Solutions diluted for infusion (in normal saline) must be infused within 6 hours of preparation. Protect from light during storage, preparation, and handling.

ReconstitutionVials should be diluted with 1.8 mL of provided diluent to a concentration of 10 mg/mL (vial contains overfill). Mix by inverting vial. After allowing air bubbles to subside, further dilute in 250 mL of NS in a non-DEHP/non-PVC container (glass, polyolefin or polypropylene). Avoid excessive shaking (may result in foaming). Use appropriate precautions for handling and disposal.

CompatibilityCompatible with normal saline; do not mix with other solutions or medications. Temsirolimus is degraded by acids and bases.

ContraindicationsThere are no contraindications listed within the FDA-approved manufacturer's labeling.

Canadian labeling: Additional contraindications (not in U.S. labeling): History of anaphylaxis after exposure to temsirolimus, sirolimus, or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Anaphylactic/hypersensitivity/infusion reactions: Hypersensitivity/infusion reactions (eg, anaphylaxis, apnea, dyspnea, flushing, loss of consciousness, hypotension, and/or chest pain) have been reported. Infusion reaction may occur with initial or subsequent infusions. Premedicate with an antihistamine (H_1 antagonist) prior to infusion; monitor during infusion; interrupt infusion for severe reaction. With discretion, treatment may be resumed at a slower infusion rate; administer an H_1 antagonist (if not given as premedication) and/or an H_2 antagonist 30 minutes prior to resuming infusion. Use with caution in patients with hypersensitivity to polysorbate 80.

- Angioedema: Has been reported; concurrent use with other drugs known to cause angioedema (eg, ACE inhibitors) may increase risk.

- Bowel perforation: Cases of bowel perforation (fatal) have occurred; promptly evaluate any new or worsening abdominal pain or bloody stools.

- Infection: Treatment may result in immunosuppression, may increase risk of opportunistic infections and/or sepsis.

- Interstitial lung disease (ILD): ILD, sometimes fatal, has been reported; symptoms include dyspnea, cough, hypoxia and/or fever, although asymptomatic cases may present; promptly evaluate worsening respiratory symptoms.

- Renal failure: Acute renal failure with rapid progression has been reported, including cases unresponsive to dialysis.

- Wound healing: May be associated with impaired wound healing; use caution in the perioperative period.

Disease-related concerns:

- CNS metastases/tumors: May be at increased risk for developing intracerebral bleeding.

- Diabetics: Increases in serum glucose are common; may alter insulin and/or oral hypoglycemic therapy requirements in patients with diabetes; monitor.

- Hepatic impairment: Has not been studied in patients with hepatic impairment; use caution. Temsirolimus is predominantly cleared by the liver.

- Hyperlipidemia: Use with caution in patients with hyperlipidemia; may increase serum lipids (cholesterol and triglycerides).

Concurrent drug therapy issues:

- Anticoagulants: Patients who are receiving anticoagulant therapy may be at increased risk for developing intracerebral bleeding.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors and moderate or strong CYP3A4 inducers (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Immunizations: Patients should not be immunized with live viral vaccines during or shortly after treatment and should avoid close contact with recently vaccinated (live vaccine) individuals.

Pregnancy Risk FactorD

Pregnancy ConsiderationsEmbryotoxicity and fetotoxicity may occur, as evidenced by increased mortality, reduced fetal weights, and delayed ossification in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy. Men and women should use effective birth control during temsirolimus treatment, and continue for 3 months after temsirolimus discontinuation.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Edema (35%), peripheral edema (27%), chest pain (16%)

Central nervous system: Pain (28%), fever (24%), headache (15%), insomnia (12%)

Dermatologic: Rash (47%), pruritus (19%), nail disorder/thinning (14%), dry skin (11%)

Endocrine & metabolic: Hyperglycemia (26% to 89%; grades 3/4: 16%), hypercholesterolemia (24% to 87%; grades 3/4: 2%), hyperlipidemia (27% to 83%; grades 3/4: 44%), hypophosphatemia (49%; grades 3/4: 18%), hypokalemia (21%; grades 3/4: 5%)

Gastrointestinal: Mucositis (41%), nausea (37%), anorexia (32%), diarrhea (27%), abdominal pain (21%), constipation (20%), stomatitis (20%), taste disturbance (20%), vomiting (19%), weight loss (19%)

Genitourinary: Urinary tract infection (15%)

Hematologic: Anemia (45% to 94%; grades 3/4: 20%), lymphopenia (53%; grades 3/4: 16%), thrombocytopenia (14% to 40%; grades 3/4: 1%; dose-limiting toxicity), leukopenia (6% to 32%; grades 3/4: 1%), neutropenia (7% to 19%; grades 3/4: 3% to 5%)

Hepatic: Alkaline phosphatase increased (68%; grades 3/4: 3%), AST increased (8% to 38%; grades 3/4: 1% to 2%)

Neuromuscular & skeletal: Weakness (51%), back pain (20%), arthralgia (18%)

Renal: Creatinine increased (14% to 57%; grades 3/4: 3%)

Respiratory: Dyspnea (28%), cough (26%), epistaxis (12%), pharyngitis (12%)

Miscellaneous: Infection (20% to 27%; includes abscess, bronchitis, cellulitis, herpes simplex, herpes zoster)

1% to 10%:

Cardiovascular: Hypertension (7%), venous thromboembolism (2%, includes DVT and PE), thrombophlebitis (1%)

Central nervous system: Chills (8%), depression (4%)

Dermatologic: Acne (10%), wound healing impaired (1%)

Gastrointestinal: Bowel perforation (fatal: 1%)

Hepatic: Hyperbilirubinemia (8%)

Neuromuscular & skeletal: Myalgia (8%)

Ocular: Conjunctivitis (7%)

Respiratory: Rhinitis (10%), pneumonia (8%), upper respiratory tract infection (7%), interstitial lung disease (2%)

Miscellaneous: Allergic/hypersensitivity/infusion reaction (9%; includes anaphylaxis, apnea, chest pain, dyspnea, flushing, hypotension, loss of consciousness)

<1%, postmarketing, and/or case reports: Acute renal failure, angioneurotic edema, pneumonitis

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak), 2D6 (weak)

Drug Interactions

ACE Inhibitors: Temsirolimus may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are also likely to be decreased (and maybe to an even greater degree). Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as carbamazepine; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

CycloSPORINE: Temsirolimus may enhance the adverse/toxic effect of CycloSPORINE. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described with concomitant sirolimus use. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are also likely to be decreased (and maybe to an even greater degree). Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as phenytoin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Protease Inhibitors: May enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Temsirolimus. Rifamycins will likely cause an even greater decrease in the concentration of the active metabolite sirolimus. Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as rifampin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Tacrolimus: Temsirolimus may enhance the adverse/toxic effect of Tacrolimus. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described with concomitant sirolimus and tacrolimus use. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease sirolimus (the active metabolite of temsirolimus) levels; avoid concurrent use. Herbs with hypoglycemic properties may increase the risk of temsirolimus-induced hypoglycemia; includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle. Avoid grapefruit and grapefruit juice (may increase the levels/effects of sirolimus).

Monitoring ParametersCBC with differential and platelets (weekly), serum chemistries including glucose (baseline and every other week), serum cholesterol and triglycerides (baseline and periodic), liver and renal function tests

Monitor for infusion reactions; infection; symptoms of ILD (or radiographic changes)

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential adverse interactions. Premedication with antihistamine prior to infusion. Patient must be monitored closely during and following each infusion for infusion reaction (eg, anaphylaxis, dyspnea, flushing, chest pain); medication/equipment for treating reactions should be readily available. Evaluate results of laboratory tests and adverse response (eg, altered glucose control, opportunistic infection, interstitial lung disease, bowel perforations, renal failure) at each infusion and throughout therapy; discontinuation may be necessary. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelets (weekly), serum chemistries including glucose (baseline and every other week), serum cholesterol and triglycerides (baseline and periodic), liver and renal function tests

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by infusion; you will be closely monitored during infusion. Report immediately unusual back or abdominal pain; acute headache; difficulty breathing or chest pain; difficulty swallowing; itching or rash; or redness, swelling, or pain at infusion site. Between treatments maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake) and nutrition (small, frequent meals). You will be required to have regularly scheduled laboratory tests while on this medication. You will be more susceptible to infection (avoid crowds and exposure to infection and do not receive any vaccination unless approved by prescriber). If you have diabetes, you will be instructed to check your glucose levels closely and notify prescriber of significant changes, excessive thirst, or frequency of urination (this medication can affect glucose control and diabetic medications may need to be adjusted). You may experience headache or insomnia (use caution when driving or engaging in tasks that require alertness until response to drug is known); loss of appetite, nausea, dry mouth or taste changes (frequent oral care, sucking lozenges, or chewing gum may help); rash; thin nails; or dry skin. Report immediately changes in respiratory status (difficulty breathing, dyspnea, unusual cough, or fever); abdominal pain or blood in stool; signs or symptoms of any urinary tract infection (difficulty urinating, burning on urination, or perineal itching); unusual infection or delayed wound healing; or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Do not get pregnant (females) or cause a pregnancy (males with partner of childbearing age) during this therapy or for 3 months after therapy has stopped. This drug can cause fetal harm. Consult prescriber for appropriate contraception. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [concentrate]:

Torisel®: 25 mg/mL [contains dehydrated ethanol, propylene glycol; diluent contains dehydrated ethanol, polyethylene glycol, polysorbate 80]

Generic AvailableNo

ManufacturerWyeth Pharmaceuticals, Inc

Mechanism of ActionTemsirolimus and its active metabolite, sirolimus, are targeted inhibitors of mTOR (mammalian target of rapamycin) kinase activity. Temsirolimus (and sirolimus) bind to FKBP-12, an intracellular protein, to form a complex which inhibits mTOR signaling, halting the cell cycle at the G1 phase in tumor cells. In renal cell carcinoma, mTOR inhibition also exhibits anti-angiogenesis activity by reducing levels of HIF-1 and HIF-2 alpha (hypoxia inducible factors) and vascular endothelial growth factor (VEGF).

Pharmacodynamics/Kinetics

Distribution: V_{dss}: 172 L

Metabolism: Hepatic; via CYP3A4 to sirolimus (primary active metabolite) and 4 minor metabolites

Half-life elimination: Temsirolimus: ~17 hours; Sirolimus: ~55 hours

Time to peak, plasma: Temsirolimus: At end of infusion; Sirolimus: 0.5-2 hours after temsirolimus infusion

Excretion: Feces (78%); urine (<5%)

Related Information

- Common Toxicity Criteria
- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Effects on oral cavity including mucositis, stomatitis, and taste disturbances.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common; may produce symptoms of mania or depression

Mental Health: Effects on Psychiatric TreatmentIncreases in serum glucose are common with temsirolimus and may alter insulin and/or oral hypoglycemic therapy requirements in diabetic patients. Hyperglycemia has also been associated with mental disorders as well as various psychotropic agents (especially atypical antipsychotics). Elevations in cholesterol and triglycerides may also be seen with psychotropics and temsirolimus. Concomitant use of these agents may produce additive effects; monitor metabolic profile. GI side effects are common; concurrent use with SSRIs, lithium, carbamazepine, or valproic acid may produce additive effects. Hematologic side effects are common; concurrent use with clozapine, carbamazepine, or valproic acid may produce additive effects. Temsirolimus is a CYP3A4 substrate; therefore, agents that inhibit its metabolism (nefazodone) may increase toxicity while inducers (eg, carbamazepine, barbiturates, phenytoin) may reduce its efficacy.

Medication Safety Issues

Sound-alike/look-alike issues:

TNKase® may be confused with t-PA

TNK (occasional abbreviation for TNKase®) is an error-prone abbreviation (mistaken as TPA)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V.) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ten EK te plase)

U.S. Brand NamesTNKase®

Canadian Brand NamesTNKase®

Pharmacologic CategoryThrombolytic Agent

Use: Labeled IndicationsThrombolytic agent used in the management of ST-elevation myocardial infarction (STEMI) for the lysis of thrombi in the coronary vasculature to restore perfusion and reduce mortality.

Recommended criteria for treatment: STEMI: Chest pain ≥20 minutes duration, onset of chest pain within 12 hours of treatment (or within prior 12-24 hours in patients with continuing ischemic symptoms), and S-T segment elevation >0.1 mV in at least two contiguous precordial leads or two adjacent limb leads on ECG or new or presumably new left bundle branch block (LBBB)

Use: Unlabeled/InvestigationalAcute MI - combination regimen of tenecteplase (unlabeled dose), abciximab, and heparin (unlabeled dose)

Dosing: Adults

STEMI: I.V.: The recommended total dose should not exceed 50 mg and is based on weight. Administer as a bolus over 5 seconds:

<60 kg: 30 mg dose

≥60 to <70 kg: 35 mg

≥70 to <80 kg: 40 mg

≥80 to <90 kg: 45 mg

≥90 kg: 50 mg

Note: All patients should receive 162-325 mg of chewable non-enteric coated aspirin as soon as possible and then daily. Administer concurrently with heparin 60 units/kg bolus (maximum: 4000 units) followed by continuous infusion of 12 units/kg/hour (maximum: 1000 units/hour) and adjust to aPTT target of 50-70 seconds (or 1.5-2 times the upper limit of control).

Combination regimen (unlabeled): Half-dose tenecteplase (15-25 mg based on weight) and abciximab 0.25 mg/kg bolus then 0.125 mcg/kg/minute (maximum 10 mcg/minute) for 12 hours with heparin dosing as follows: Concurrent bolus of 40 units/kg (maximum 3000 units), then 7 units/kg/hour (maximum 800 units/hour) as continuous infusion. Adjust to aPTT target of 50-70 seconds.

Note: The 2004 ACC/AHA guidelines for the management of patients with STEMI suggests that abciximab and half-dose reteplase or tenecteplase may be considered for prevention of reinfarction in patients with anterior MI, who are <75 years of age and have no risk factors for bleeding. However, more recently the American College of Chest Physicians recommends against the combination of half-dose reteplase or tenecteplase and standard-dose abciximab (with low dose unfractionated heparin) in any patient with STEMI due to the lack of mortality benefit and the risk of major bleeding (Goodman, 2008).

Dosing: ElderlyRefer to adult dosing. Although dosage adjustments are not recommended, the elderly have a higher incidence of morbidity and mortality with the use of tenecteplase. The 30-day mortality in the ASSENT-2 trial was 2.5% for patients younger than 65 years, 8.5% for patients between 65 and 74 years, and 16.2% for patients 75 years and older. The intracranial hemorrhage rate was 0.4% for patient younger than 65 years, 1.6% for patients between 65 and 74 years, and 1.7% for patients 75 years and older. The risks and benefits of use should be weighted carefully in the elderly.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentSevere hepatic failure is a relative contraindication. Recommendations were not made for mild to moderate hepatic impairment.

Administration: I.V.Tenecteplase should be reconstituted using the supplied 10 mL syringe with TwinPak™ Dual Cannula Device and 10 mL SWFI. Do not shake when reconstituting. Slight foaming is normal; will dissipate if left standing for several minutes. Any unused solution should be discarded. The reconstituted solution is 5 mg/mL. Dextrose-containing lines must be flushed with a saline solution before and after administration. Check frequently for signs of bleeding. Avoid I.M. injections and nonessential handling of patient.

StorageStore at room temperature not to exceed 30°C (86°F) or under refrigeration 2°C to 8°C (36°F to 46°F). If reconstituted and not used immediately, store in refrigerator and use within 8 hours.

ReconstitutionTenecteplase should be reconstituted using the supplied 10 mL syringe with TwinPak™ Dual Cannula Device and 10 mL sterile water for injection.

Compatibility**Incompatible** with dextrose solutions.

ContraindicationsHypersensitivity to tenecteplase or any component of the formulation; active internal bleeding; history of stroke; intracranial/intraspinal surgery or trauma within 2 months; intracranial neoplasm; arteriovenous malformation or aneurysm; bleeding diathesis; severe uncontrolled hypertension

Allergy Considerations

- Thrombolytic Agent, Fibrin-Specific Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: Coronary thrombolysis may result in reperfusion arrhythmias.
- Bleeding: Monitor all potential bleeding sites. If serious bleeding occurs, the infusion of tenecteplase and heparin should be stopped.
- Cholesterol embolism: Has rarely been reported.

Disease-related concerns:

- Conditions that increase bleeding risk: For the following conditions the risk of bleeding is higher with use of tenecteplase and should be weighed against the benefits of therapy: recent (within 10 days) major surgery (eg, CABG, obstetrical delivery, organ biopsy, previous puncture of noncompressible vessels), cerebrovascular disease, recent (within 10 days) gastrointestinal or genitourinary bleeding, recent trauma (within 10 days) including CPR, hypertension (systolic BP >180 mm Hg and/or diastolic BP >110 mm Hg), high likelihood of left heart thrombus (eg, mitral stenosis with atrial fibrillation), acute pericarditis, subacute bacterial endocarditis, hemostatic defects including ones caused by severe renal or hepatic dysfunction, significant hepatic dysfunction, diabetic hemorrhagic retinopathy or other hemorrhagic ophthalmic conditions, septic thrombophlebitis or occluded AV cannula at seriously infected site, and/or any other condition in which bleeding constitutes a significant hazard or would be particularly difficult to manage because of location.
- Myocardial infarct (MI): Appropriate use: Follow standard management for MI while infusing tenecteplase.

Concurrent drug therapy issues:

- Anticoagulants: Use with caution in patients receiving oral anticoagulants; increased risk of bleeding.
- GP IIb/IIIa inhibitors: Use with caution in patients who had recent administration of GP IIb/IIIa inhibitors.
- Heparin: Concurrent heparin anticoagulation may contribute to bleeding.

Special populations:

- Elderly: Use with caution in patients with advanced age (see Usual Dosing, Elderly); increased risk of bleeding.
- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Use with caution in pregnancy; increased risk of bleeding.

Other warnings/precautions:

- Administration: Avoid intramuscular injections and nonessential handling of the patient for a few hours after administration. Venipunctures should be performed carefully and only when necessary. If arterial puncture is necessary, use an upper extremity vessel that can be manually compressed. Caution with readministration of tenecteplase.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdminister to pregnant women only if the potential benefits justify the risk to the fetus.

LactationUse caution

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is the major adverse effect associated with tenecteplase. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the dosage administered, concurrent use of multiple agents which alter hemostasis, and patient predisposition. Rapid lysis of coronary artery thrombi by thrombolytic agents may be associated with reperfusion-related arterial and/or ventricular arrhythmia. The incidence of stroke and bleeding increase in patients >65 years.

>10%:

Hematologic: Bleeding (22% minor: ASSENT-2 trial)

Local: Hematoma (12% minor)

1% to 10%:

Central nervous system: Stroke (2%)

Gastrointestinal: GI hemorrhage (1% major, 2% minor), epistaxis (2% minor)

Genitourinary: GU bleeding (4% minor)

Hematologic: Bleeding (5% major: ASSENT-2 trial)

Local: Bleeding at catheter puncture site (4% minor), hematoma (2% major)

Respiratory: Pharyngeal bleeding (3% minor)

<1%: Intracranial hemorrhage (0.9%), retroperitoneal bleeding, respiratory tract bleeding, anaphylaxis, angioedema, laryngeal edema, rash, urticaria, cholesterol embolism (clinical features may include livedo reticularis, “purple toe” syndrome, acute renal failure, gangrenous digits, hypertension, pancreatitis, MI, cerebral infarction, spinal cord infarction, retinal artery occlusion, bowel infarction, rhabdomyolysis), GU bleeding (<1% major), bleeding at catheter puncture site (<1% major)

Additional cardiovascular events associated with use in MI: Cardiogenic shock, arrhythmia, AV block, pulmonary edema, heart failure, cardiac arrest, recurrent myocardial ischemia, myocardial reinfarction, myocardial rupture, cardiac tamponade, pericarditis, pericardial effusion, mitral regurgitation, thrombosis, embolism, electromechanical dissociation, hypotension, fever, nausea, vomiting

Drug Interactions

Anticoagulants: Thrombolytic Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Aprotinin: May diminish the therapeutic effect of Thrombolytic Agents. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Thrombolytic Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Thrombolytic Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Monitoring ParametersCBC, aPTT, signs and symptoms of bleeding, ECG monitoring

Nursing: Physical Assessment/MonitoringWeigh benefits against risks of use in conditions where bleeding constitutes a significant hazard or would be particularly difficult to manage because of location. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (especially those medications that may affect coagulation [warfarin] or platelet function [eg, NSAIDs, dipyridamole, ticlopidine, and clopidogrel]). See Administration for infusion specifics. Patient should be closely monitored for bleeding during and following treatment. Monitor infusion site, neurological status (eg, intracranial hemorrhage), vital signs, and ECG (reperfusion arrhythmias). Arrhythmias may occur; antiarrhythmic drugs should be immediately available. Bedrest and bleeding precautions should be maintained; avoid I.M. injections, venipuncture (unless absolutely necessary), and nonessential handling of the patient. If arterial puncture is necessary, an upper extremity vessel that can be manually compressed should be used. Patient instructions determined by patient condition.

Monitoring: Lab TestsCBC, PTT, signs and symptoms of bleeding, ECG monitoring

Patient EducationThis medication is only administered by infusion; you will be monitored closely during and after treatment. Immediately report burning, pain, redness, swelling, or oozing at infusion site. Following infusion you will have a tendency to bleed easily; use caution to prevent injury (use electric razor, soft toothbrush, and caution with knives, needles, or anything sharp) and follow instructions for strict bedrest to reduce the risk of injury. If bleeding does occur, report immediately and apply pressure to bleeding spot until bleeding stops completely. Report unusual pain (acute headache, joint pain, chest pain); unusual bruising or bleeding; blood in urine, stool, or vomitus; bleeding gums; vision changes; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [recombinant]:

TNKase®: 50 mg

Generic AvailableNo

Mechanism of ActionInitiates fibrinolysis by binding to fibrin and converting plasminogen to plasmin.

Pharmacodynamics/Kinetics

Distribution: V_d is weight related and approximates plasma volume

Metabolism: Primarily hepatic

Half-life elimination: 90-130 minutes

Excretion: Clearance: Plasma: 99-119 mL/minute

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause stroke

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

ST-Elevation Myocardial Infarction: The 2004 ACC/AHA guidelines for the management of patients with acute myocardial infarction recommend prehospital thrombolysis in special circumstances (eg, transport time >30 minutes). Efforts to quickly identify and safely treat appropriate candidates for therapy continue. Reducing treatment delays is very important to improve mortality. Thrombolytic therapy is indicated in patients with ST-segment elevation of >1 mm in two or more contiguous leads or at least 2 adjacent limb leads in patients with chest discomfort >30 minutes but ≤12 hours. Patients with chest discomfort suggestive of ischemia and new-onset left bundle branch block (LBBB) are also candidates for thrombolysis. Generally there is only a small trend for benefit of therapy after a delay of more than 12-24 hours, but thrombolysis may be considered for selected patients with ongoing ischemic pain and extensive ST elevation. Additional absolute contraindications for fibrinolysis use in ST-elevation myocardial infarction from the 2004 ACC/AHA guidelines: Any prior intracranial hemorrhage, ischemic stroke within 3 months (except one within 3 hours), significant closed head or facial trauma within 3 months. Additional relative contraindications include history of chronic severe, poorly-controlled hypertension, severe uncontrolled hypertension on presentation (systolic BP >180 mm Hg or diastolic >110 mm Hg; could be an absolute contraindication in low-risk patients), history of prior ischemic stroke > 3 months, dementia, or known intracranial pathology, traumatic or prolonged (>10 minutes) CPR or major surgery (<3 weeks), recent (within 2-4 weeks) internal bleeding, noncompressible vascular punctures, pregnancy, active peptic ulcer, current use of anticoagulants.

Thrombolytic and GP IIb/IIIa Inhibitor: In the GUSTO V trial, patients with acute MI were randomized to standard-dose reteplase or half-dose reteplase (two boluses of 5 units each, 30 minutes apart) and full dose abciximab. Thirty-day mortality (primary endpoint) was similar in both groups. The combination treatment group had fewer deaths or nonfatal reinfarctions, less need for urgent revascularization, fewer major ischemic complications. More bleeding occurred in the combination treatment group, but intracranial hemorrhage and nonfatal disabling stroke were similar in both groups. All cause mortality at one year was similar in both groups. In TIMI 14, the combination of full-dose abciximab (0.25 mg/kg bolus followed by a 12-hour infusion of 0.125 mcg/kg/minute, maximum 10 mcg/minute) and half-dose alteplase (15 mg bolus followed by 35 mg infusion over 60 minutes) resulted in 74% of patients achieving TIMI grade 3 flow at 90 minutes. Patients with acute MI were randomized in an open-label study to full-dose tenecteplase and enoxaparin, half-dose tenecteplase with low-dose, weight-based heparin and a 12-hour infusion of abciximab or full-dose tenecteplase with weight-based heparin (ASSENT-3 Investigators, 2001). The primary endpoint (30 days) was mortality, in-house reinfarction, and in-house refractory ischemia. The abciximab arm and the enoxaparin arm had significantly less mortality, reinfarction, and refractory ischemia than in the unfractionated heparin/full-dose tenecteplase. One year mortality (secondary endpoint) was similar in all 3 treatment arms (Sinnaeve, 2004). However, 1 year outcome tended to be worse with abciximab in patients with diabetes. The 2004 ACC/AHA guidelines for the management of patients with acute myocardial infarction suggests that abciximab and half-dose reteplase or tenecteplase may be considered for prevention of reinfarction in patients with an anterior MI, who are <75 years of age and have no risk factors for bleeding.

However, more recently, the 2008 American College of Chest Physicians guidelines recommends against the combination of half-dose reteplase or tenecteplase and standard-dose abciximab (with low dose unfractionated heparin) in any patient with STEMI due to the lack of mortality benefit and the risk of major bleeding (Goodman, 2008).

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Management of Intracerebral Hemorrhage (ICH) Due to Thrombolysis: Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, fibrinolytic-related ICH should be treated with infusion of platelets (6-8 units) and cryoprecipitate which contains factor VIII (Class IIb recommendation).

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ten i POE side)

U.S. Brand NamesVumon®

Canadian Brand NamesVumon®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsTreatment of acute lymphocytic leukemia, small cell lung cancer

Dosing: Adults

Antineoplastic: I.V. (refer to individual protocols): 50-180 mg/m^2 once or twice weekly for 4-6 weeks or 20-60 mg/m^2/day for 5 days

Small cell lung cancer: I.V.: 80-90 mg/m^2/day for 5 days every 4-6 weeks

Dosage adjustment in Down syndrome patient: Reduce initial dosing give the first course at half the usual dose. Patients with both Down syndrome and leukemia may be especially sensitive to myelosuppressive chemotherapy.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Antineoplastic: I.V. (refer to individual protocols): 130 mg/m^2/week, increasing to 150 mg/m^2 after 3 weeks and up to 180 mg/m^2 after 6 weeks

Acute lymphoblastic leukemia (ALL): I.V.: 165 mg/m^2 twice weekly for 8-9 doses **or** 250 mg/m^2 weekly for 4-8 weeks

Dosing: Renal ImpairmentData is insufficient, but dose adjustments may be necessary in patient with significant renal impairment.

Dosing: Hepatic ImpairmentData is insufficient, but dose adjustments may be necessary in patient with significant hepatic impairment.

Dosing: Combination Regimens

Leukemia, acute lymphocytic: Linker Protocol

Neuroblastoma:

CCDDT (Neuroblastoma)

CCT (Neuroblastoma)

OPEC

OPEC-D

PE-CAdO

Oncology: Bone Marrow - High DoseI.V.: 750-1000 mg/m^2

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Irritant. Slow I.V. infusion over ≥30 minutes.

Administration: I.V. DetailHypotension or increased nausea and vomiting can occur if infused rapidly. Flush thoroughly before and after administration. Incompatible with heparin. Do not use in-line filter during I.V. infusion.

Teniposide must be diluted with either D$_5$W or 0.9% sodium chloride solutions to a final concentration of 0.1, 0.2, 0.4, or 1 mg/mL. In order to prevent extraction of the plasticizer DEHP, solutions should be prepared in non-DEHP-containing containers such as glass or polyolefin containers. **The use of polyvinyl chloride (PVC) containers is not recommended.**

pH: 5

StorageStore ampuls in refrigerator at 2°C to 8°C (36°F to 46°F). Reconstituted solutions are stable at room temperature for up to 24 hours after preparation.

ReconstitutionTeniposide must be diluted with either D_5W or 0.9% sodium chloride solutions to a final concentration of 0.1, 0.2, 0.4, or 1 mg/mL. However, precipitation may occur at any concentration. **Solutions should be prepared in non-DEHP-containing containers such as glass or polyolefin containers.** The use of polyvinyl chloride (PVC) containers is not recommended. Administer 1 mg/mL solutions within 4 hours of preparation to reduce the potential for precipitation.

CompatibilityStable in D_5W, LR, NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amikacin, aminophylline, amphotericin B, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, cladribine, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, ifosfamide, imipenem/cilastatin, leucovorin, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, minocycline, mitomycin, mitoxantrone, morphine, nalbuphine, netilmicin, ondansetron, piperacillin, plicamycin, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, sargramostim, sodium bicarbonate, streptozocin, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Idarubicin, heparin.

ContraindicationsHypersensitivity to teniposide, Cremophor® EL (polyoxyethylated castor oil), or any component of the formulation; pregnancy

Allergy Considerations

- Epidophyllotoxin Allergy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hypersensitivity reactions: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Severe myelosuppression may occur;** monitor for infection and bleeding.
- Extravasation: For I.V. use only; may cause local tissue necrosis or thrombophlebitis if extravasation occurs.
- Hypersensitivity reactions: **[U.S. Boxed Warning]: Hypersensitivity reactions, including anaphylaxis-like reactions, have been reported;** monitor during infusion; immediate treatment for anaphylactic reaction should be available during administration.

Dosage form specific issues:

- Benzyl alcohol: Product contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.
- Dehydrated alcohol: Product contains about 43% alcohol.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

LactationNot recommended

Adverse Reactions

>10%:

Gastrointestinal: Mucositis (75%); diarrhea, nausea, vomiting (20% to 30%); anorexia

Hematologic: Myelosuppression, leukopenia, neutropenia (95%), thrombocytopenia (65% to 80%), anemia

Onset: 5-7 days

Nadir: 7-10 days

Recovery: 21-28 days

1% to 10%:

Cardiovascular: Hypotension (2%), associated with rapid (<30 minutes) infusions

Dermatologic: Alopecia (9%), rash (3%)

Miscellaneous: Anaphylactoid reactions (5%) (fever, rash, hyper-/hypotension, dyspnea, bronchospasm), usually seen with rapid (<30 minutes) infusions

<1%: Lethargy, peripheral neuropathy, somnolence

Oncology: VesicantNo; may be an irritant
Oncology: Emetic PotentialModerate (30% to 60%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C9 (weak), 3A4 (weak)
Drug Interactions

Barbiturates: May increase the metabolism of Teniposide. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease teniposide levels.
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, potential for increased or decreased levels/effects and risk of toxicity). Premedication with antiemetic may be beneficial. See Administration for infusion specifics. Infusion site should be closely monitored to prevent extravasation. Patient should be monitored closely during infusion for possible hypotension (may require discontinuing infusion and administering supportive therapy) or hypersensitivity reactions (chills, fever, tachycardia, dyspnea, hypotension). Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, mucositis, diarrhea, myelosuppression, leukopenia) prior to each infusion and throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsCBC, platelet count
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion. Report immediately any swelling, pain, burning, or redness at infusion site. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or loss of hair (reversible). Report unusual bleeding or bruising, persistent fever or chills, sore throat, sores in mouth or vagina, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 10 mg/mL (5 mL) [contains benzyl alcohol, dehydrated ethanol 42.7%, and polyoxyethylated castor oil]

Generic AvailableNo
Mechanism of ActionTeniposide does not inhibit microtubular assembly; it has been shown to delay transit of cells through the S phase and arrest cells in late S or early G_2 phase. Teniposide is a topoisomerase II inhibitor, and appears to cause DNA strand breaks by inhibition of strand-passing and DNA ligase action.
Pharmacodynamics/Kinetics

Distribution: V_d: 0.28 L/kg; Adults: 8-44 L; Children: 3-11 L; mainly into liver, kidneys, small intestine, and adrenals; crosses blood-brain barrier to a limited extent

Protein binding: 99.4%

Metabolism: Extensively hepatic

Half-life elimination: 5 hours

Excretion: Urine (44%, 21% as unchanged drug); feces (≤10%)

Related Information

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(te NOE fo veer)

U.S. Brand NamesViread®

Canadian Brand NamesViread®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleotide)

Use: Labeled IndicationsManagement of HIV infections in combination with at least two other antiretroviral agents; treatment of chronic hepatitis B virus (HBV)

Dosing: Adults**HIV infection, hepatitis B infection:** Oral: 300 mg once daily

Note: Concurrent use with adefovir and/or tenofovir combination products should be avoided.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥50 mL/minute: No adjustment necessary.

Cl_{cr} 30-49 mL/minute: 300 mg every 48 hours

Cl_{cr} 10-29 mL/minute: 300 mg every 72-96 hours

Cl_{cr} <10 mL/minute without hemodialysis: No recommendation available.

Hemodialysis: 300 mg every 7 days or after a total of ~12 hours of dialysis (usually once weekly assuming 3 dialysis sessions lasting about 4 hours each)

Dosing: Hepatic ImpairmentNo dosage adjustment required.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food. Consider calcium and vitamin D supplementation in patients with history of bone fracture or osteopenia.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsThere are no contraindications listed within the FDA-approved labeling.

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Decreased bone mineral density: Use has been associated with decreases in bone mineral density (~5% to 7%) and osteomalacia. Consider monitoring of bone density in patients at risk for osteopenia or with a history of pathologic fractures; consider calcium and vitamin D supplementation.
- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with tenofovir and other nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Renal toxicity: May cause renal toxicity (acute renal failure and/or Fanconi syndrome); avoid use with concurrent or recent nephrotoxic therapy. Calculate creatinine clearance prior to initiation of therapy and monitor renal function (including recalculation of creatinine clearance and serum phosphorus) during therapy. Dosage adjustment required in patients with Cl_{cr} <50 mL/minute. Use with caution in patients with low body weight, or concurrent medications which increase tenofovir levels.

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Severe, acute exacerbation of hepatitis B may occur upon discontinuation.** Monitor liver function several months after discontinuing treatment; reinitiation of antihepatitis B therapy may be required. Treatment of HBV in patients with unrecognized/untreated HIV may lead to HIV resistance; patients should be tested for presence of HIV infection prior to initiating therapy

- Hepatic impairment: Use with caution in patients with hepatic impairment. No dosage adjustment is required; limited studies indicate the pharmacokinetics of tenofovir are not altered in hepatic dysfunction.

- HIV: Appropriate use: Do not use as monotherapy in treatment of HIV. Treatment of HIV in patients with unrecognized/untreated HBV may lead to rapid HBV resistance. Patients should be tested for presence of chronic hepatitis B infection prior to initiation of therapy.

- Renal impairment: Use with caution in patients with renal impairment (Cl_{cr} <50 mL/minute); dosage adjustment required.

Concurrent drug therapy issues:

- Adefovir: Do not use concurrently with adefovir for the treatment of chronic hepatitis B.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Tenofovir combination products: Do not use concurrently with tenofovir combination products (Atripla™, Truvada®).

Special populations:

- Elderly: Due to a higher incidence of hepatic and/or renal impairment, use with caution in the elderly. Dosage adjustment based on renal function may be required.

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies have shown decreased fetal growth and reduced fetal bone porosity. Clinical studies in children have shown bone demineralization with chronic use. Tenofovir crosses the human placenta; limited data indicate decreased maternal bioavailability during the 3rd trimester. Due to the potential for bone effects, use in pregnancy only if clearly needed. Cases of lactic acidosis/hepatic steatosis syndrome have been reported in pregnant women receiving nucleoside analogues. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy in women receiving nucleoside analogues. Health professionals are encouraged to contact the Antiretroviral Pregnancy Registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsPercentages listed were from clinical trials with tenofovir addition to prior antiretroviral therapy. Only adverse events from treatment naïve patient studies which varied significantly were noted (eg, rash event). Frequencies listed are treatment-emergent adverse effects noted at higher frequency than in the placebo group. Patients treated for chronic hepatitis B had similar reactions and frequencies.

>10%:

Cardiovascular: Chest pain (3%)

Central nervous system: Pain (7% to 12%)

Gastrointestinal: Diarrhea (9% to 16%), nausea (8% to 11%)

Neuromuscular & skeletal: Weakness (7% to 11%)

1% to 10%:

Central nervous system: Depression (4% to 9%; treatment naïve 11%), fatigue (9%), headache (5% to 8%; treatment naïve 14%), fever (2% to 4%; treatment naïve 8%), dizziness (1% to 8%), anxiety (treatment naïve 6%), insomnia (3% to 5%)

Dermatologic: Rash event (maculopapular, pustular, or vesiculobullous rash, pruritus or urticaria 5% to 7%; treatment naïve 18%)

Endocrine & metabolic: Triglycerides increased (grades 3/4: 4% to 11%), hyperglycemia (grades 3/4: 2%)

Gastrointestinal: Vomiting (4% to 7%), abdominal pain (4% to 7%), serum amylase increased (grades 3/4: 4%; treatment naïve 9%), dyspepsia (3% to 4%), flatulence (3% to 4%), anorexia (3% to 4%), weight loss (2% to 4%)

Genitourinary: Hematuria (grades 3/4: 7%)

Hematologic: Neutropenia (1% to 2%; grade 3/4: 3%)

Hepatic: Transaminases increased (2% to 10%), alkaline phosphatase increased (grades 3/4: 1%)

Neuromuscular & skeletal: Creatine kinase (grade 3/4: 7% to 12%), back pain (3% to 4%; treatment naïve 9%), neuropathy (peripheral 3% to 5%), myalgia (3% to 4%)

Renal: Glycosuria (≤3%)

Respiratory: Respiratory tract infection (upper; 8%), sinusitis (8%), pharyngitis (5%), pneumonia (2% to 3%; treatment naïve 5%)

Miscellaneous: Diaphoresis (3%)

Postmarketing and/or case reports: Acute tubular necrosis, allergic reaction, bone mineral density decreased, dyspnea, Fanconi syndrome, hepatic steatosis, hepatitis, hypokalemia, hypophosphatemia, immune reconstitution syndrome, interstitial nephritis, lactic acidosis, muscle weakness, nephrogenic diabetes insipidus, nephrotoxicity, osteomalacia, pancreatitis, proteinuria, proximal renal tubulopathy, renal failure, renal myopathy, rhabdomyolysis, serum creatinine increased

Metabolism/Transport Effects **Inhibits** CYP1A2 (weak)

Drug Interactions

Acyclovir-Valacyclovir: May decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Adefovir: May diminish the therapeutic effect of Tenofovir. Specifically, adefovir-associated mutations in Hepatitis B viral reverse transcriptase may decrease viral susceptibility to tenofovir. Tenofovir may increase the serum concentration of Adefovir. Similarly, Adefovir may increase the concentration of Tenofovir. *Risk D: Consider therapy modification*

Atazanavir: Tenofovir may decrease the serum concentration of Atazanavir. Atazanavir may increase the serum concentration of Tenofovir. Management: When combined use required, tenofovir 300mg and atazanavir 300mg should be used together with ritonavir 100mg, all given as a single daily dose with food. Atazanavir without ritonavir should not be used with tenofovir. *Risk D: Consider therapy modification*

Didanosine: Tenofovir may diminish the therapeutic effect of Didanosine. Tenofovir may increase the serum concentration of Didanosine. *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: May decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Lopinavir: May enhance the nephrotoxic effect of Tenofovir. Lopinavir may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Protease Inhibitors: Tenofovir may decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. **Exceptions:** Saquinavir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Food: Fatty meals may increase the bioavailability of tenofovir. Tenofovir may be taken with or without food.

Monitoring Parameters

Patients with HIV: CBC with differential, reticulocyte count, serum creatine kinase, CD4 count, HIV RNA plasma levels, renal and hepatic function tests, bone density (long-term), serum phosphorus; testing for HBV is recommended prior to the initiation of antiretroviral therapy

Patients with HBV: HIV status (prior to initiation of therapy); bone density (long-term), serum phosphorus; serum creatinine (prior to initiation and during therapy; every 3 months in patients with medical conditions which predispose to renal insufficiency and in all patients treated for >1 year; more frequent monitoring required if preexisting renal insufficiency detected [Lok, 2007]); viral load; LFTs for several months following discontinuation of tenofovir.

Patients with HIV and HBV coinfection should be monitored for several months following tenofovir discontinuation.

Nursing: Physical Assessment/Monitoring Assess closely for any previous allergy history prior to beginning treatment. Evaluate other pharmacological or herbal products patient may be taking for potential interactions (eg, concurrent use with other antiretroviral nephrotoxic or hepatotoxic drugs may increase potential for severe toxicities). Assess results of all laboratory tests (specific to purpose for use). Evaluate therapeutic response and adverse reactions on a regular basis throughout therapy (eg, lactic acidosis osteomalacia, gastrointestinal disturbance, neutropenia, myalgia, peripheral neuropathy). Teach patient proper use (drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests

Patients with HIV: CBC with differential, reticulocyte count, serum creatine kinase, CD4 count, HIV RNA plasma levels, renal and hepatic function tests, bone density (long-term), serum phosphorus; testing for HBV is recommended prior to the initiation of antiretroviral therapy

Patients with HBV: HIV status (prior to initiation of therapy); bone density (long-term), serum phosphorus; serum creatinine (prior to initiation and during therapy; every 3 months in patients with medical conditions which predispose to renal insufficiency and in all patients treated for >1 year; more frequent monitoring required if preexisting renal insufficiency detected [Lok, 2007]); viral load; LFTs for several months following discontinuation of tenofovir.

Patients with HIV and HBV coinfection should be monitored for several months following tenofovir discontinuation.

Patient Education Do not take any new prescription or OTC medications or herbal products without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other people. When used to treat HIV, this drug will be prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. May cause dizziness or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known) or nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report immediately any tingling, pain, or loss of sensation in toes, feet, muscles, or joints; swollen glands; alterations in urinary pattern; swelling of extremities; weight gain or loss; unusual weakness; signs of opportunistic infection (burning on urination, perineal itching, white plaques in mouth, unhealed sores, persistent sore throat or cough); or other persistent adverse effects. If you are instructed to stop the medication; do not restart without specific instruction by your prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as disoproxil fumarate:

Viread®: 300 mg [equivalent to 245 mg tenofovir disoproxil]

Generic AvailableNo
ManufacturerGilead Sciences
Pricing: U.S. (www.drugstore.com)

Tablets (Viread)

300 mg (30): $621.49

Mechanism of ActionTenofovir disoproxil fumarate (TDF) is an analog of adenosine 5'-monophosphate; it interferes with the HIV viral RNA dependent DNA polymerase resulting in inhibition of viral replication. TDF is first converted intracellularly by hydrolysis to tenofovir and subsequently phosphorylated to the active tenofovir diphosphate; nucleotide reverse transcriptase inhibitor. Tenofovir inhibits replication of HBV by inhibiting HBV polymerase.
Pharmacodynamics/Kinetics

Distribution: 1.2-1.3 L/kg

Protein binding: ≤7% to serum proteins

Metabolism: Tenofovir disoproxil fumarate (TDF) is converted intracellularly by hydrolysis (by non-CYP enzymes) to tenofovir, then phosphorylated to the active tenofovir diphosphate

Bioavailability: ~25% (fasting); increases ~40% with high-fat meal

Half-life elimination: ~17 hours

Time to peak, serum: Fasting: 36-84 minutes; With food: 96-144 minutes

Excretion: Urine (70% to 80%) via filtration and active secretion, primarily as unchanged tenofovir

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV
- Perinatal HIV Guidelines

Pharmacotherapy PearlsApproval was based on two clinical trials involving patients who were previously treated with antiretrovirals with continued evidence of HIV replication despite therapy. The risk:benefit ratio for untreated patients has not been established (studies currently ongoing), however, patients who received tenofovir showed significant decreases in HIV replication as compared to continuation of standard therapy.

A high rate of early virologic nonresponse was observed when abacavir, lamivudine, and tenofovir were used as the initial regimen in treatment-naive patients. A high rate of early virologic nonresponse was also observed when didanosine, lamivudine, and tenofovir were used as the initial regimen in treatment-naive patients. Use of either of these combinations is not recommended; patients currently on either of these regimens should be closely monitored for modification of therapy. Early virologic failure was also observed with tenofovir and didanosine delayed release capsules, plus either efavirenz or nevirapine; use caution in treatment-naive patients with high baseline viral loads.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness and depression
Mental Health: Effects on Psychiatric TreatmentNausea and diarrhea are common; use caution with SSRIs, lithium, and valproic acid. May cause elevation of triglycerides; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.
Index TermsPMPA; TDF; Tenofovir Disoproxil Fumarate

Jump To Field (Select Field Name)

Pronunciation(ter AY zoe sin)

Canadian Brand NamesAlti-Terazosin; Apo-Terazosin®; Hytrin®; Novo-Terazosin; Nu-Terazosin; PMS-Terazosin

Pharmacologic CategoryAlpha $_1$ Blocker

Use: Labeled IndicationsManagement of mild to moderate hypertension; alone or in combination with other agents such as diuretics or beta-blockers; benign prostate hyperplasia (BPH)

Use: Unlabeled/InvestigationalPediatric hypertension

Dosing: Adults

Hypertension: Oral: Initial: 1 mg at bedtime; slowly increase dose to achieve desired blood pressure, up to 20 mg/day; usual dose range (JNC 7): 1-20 mg once daily

Dosage reduction may be needed when adding a diuretic or other antihypertensive agent; if drug is discontinued for greater than several days, consider beginning with initial dose and retitrate as needed; dosage may be given on a twice daily regimen if response is diminished at 24 hours and hypotensive is observed at 2-4 hours following a dose

Benign prostatic hyperplasia: Oral: Initial: 1 mg at bedtime, increasing as needed; most patients require 10 mg day. If no response after 4-6 weeks of 10 mg/day, may increase to 20 mg/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Hypertension (unlabeled use):** Oral: Initial: 1 mg once daily; gradually increase dose as necessary, up to maximum of 20 mg/day

Dietary ConsiderationsMay be taken without regard to meals at the same time each day.

ContraindicationsHypersensitivity to quinazolines (doxazosin, prazosin, terazosin) or any component of the formulation; concurrent use with phosphodiesterase-5 (PDE-5) inhibitors including sildenafil (>25 mg), tadalafil, or vardenafil

Allergy Considerations

- Alpha-Blocker, Piperazinyl Quinazoline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina: Discontinue if symptoms of angina occur or worsen.
- Floppy iris syndrome: Intraoperative floppy iris syndrome has been observed in cataract surgery patients who were on or were previously treated with alpha$_1$-blockers; causality has not been established and there appears to be no benefit in discontinuing alpha-blocker therapy prior to surgery.
- Orthostatic hypotension/syncope: May cause significant orthostatic hypotension and syncope, especially with first dose; anticipate a similar effect if therapy is interrupted for a few days, if dosage is rapidly increased, or if another antihypertensive drug (particularly vasodilators) or a PDE-5 inhibitor is introduced. Patients should be cautioned about performing hazardous tasks when starting new therapy or adjusting dosage upward.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Prostate cancer: It is recommended to rule out prostatic carcinoma before beginning therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsAdverse reactions such as dry mouth and urinary problems can be particularly bothersome in the elderly.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse ReactionsAsthenia, postural hypotension, dizziness, somnolence, nasal congestion/rhinitis, and impotence were the only events noted in clinical trials to occur at a frequency significantly greater than placebo ($p < 0.05$).

>10%:

Central nervous system: Dizziness, headache

Neuromuscular & skeletal: Muscle weakness

1% to 10%:

Cardiovascular: Edema, palpitation, chest pain, peripheral edema (3%), orthostatic hypotension (3% to 4%), tachycardia

Central nervous system: Fatigue, nervousness, drowsiness

Gastrointestinal: Dry mouth

Genitourinary: Urinary incontinence

Ocular: Blurred vision

Respiratory: Dyspnea, nasal congestion

<1% (Limited to important or life-threatening): Sexual dysfunction, syncope (0.8%)

Postmarketing and/or case reports: Allergic reactions, anaphylaxis, atrial fibrillation, priapism, thrombocytopenia

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Silodosin: Alpha1-Blockers may enhance the adverse/toxic effect of Silodosin. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. Silodosin may enhance the hypotensive effect of Alpha1-Blockers. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. *Risk X: Avoid combination*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid saw palmetto. Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersStanding and sitting/supine blood pressure, especially following the initial dose at 2-4 hours following the dose and thereafter at the trough point to ensure adequate control throughout the dosing interval; urinary symptoms

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (especially anything that may decrease antihypertensive response [NSAIDS, ephedra, yohimbe, ginseng] or increase hypotensive effect [beta-blockers, diuretics, ACE inhibitors]). Assess therapeutic effectiveness (blood pressure) and adverse reactions (eg, hypotension, dizziness, somnolence, impotence) at beginning of therapy and on a regular basis with long-term therapy. When discontinuing, dose should be tapered and blood pressure monitored closely. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; at bedtime. Do not skip dose or discontinue without consulting prescriber. Follow recommended diet and exercise program. May cause drowsiness, dizziness, or impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); dry mouth or nausea (frequent mouth care or sucking lozenges may help); urinary incontinence (void before taking medication); or sexual dysfunction (reversible, may resolve with continued use). Report altered CNS status (eg, fatigue, lethargy, confusion, nervousness); sudden weight gain (weigh yourself in the same clothes at the same time of day once a week); unusual or persistent swelling of ankles, feet, or extremities; palpitations or rapid heartbeat; respiratory difficulty; muscle weakness; or other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

ManufacturerAbbott Laboratories (Pharmaceutical Product Division)

Pricing: U.S. (www.drugstore.com)

Capsules (Terazosin HCl)

1 mg (30): $14.45

2 mg (30): $13.99

5 mg (30): $13.99

10 mg (30): $13.99

Mechanism of Action Alpha$_1$-specific blocking agent with minimal alpha$_2$ effects; this allows peripheral postsynaptic blockade, with the resultant decrease in arterial tone, while preserving the negative feedback loop which is mediated by the peripheral presynaptic alpha$_2$-receptors; terazosin relaxes the smooth muscle of the bladder neck, thus reducing bladder outlet obstruction

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Absorption: Rapid

Protein binding: 90% to 95%

Metabolism: Extensively hepatic

Half-life elimination: 9.2-12 hours

Time to peak, serum: ~1 hour

Excretion: Feces (60%); urine (40%)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Dizziness is common; may cause drowsiness or nervousness; may rarely cause insomnia or depression

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations An alpha$_1$-blocker may be used in combination with other agents for the treatment of hypertension or alone in select patients who fail to respond or have contraindications to other agents. Patients with BPH may derive an extra benefit from therapy. Recently, the doxazosin treatment arm of ALLHAT (Antihypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial) was prematurely stopped due to a significantly higher incidence (25%) of cardiovascular events (particularly heart failure events), compared to the diuretic (chlorthalidone) treatment arm. This unfavorable difference was also present when doxazosin was compared to the amlodipine and lisinopril treatment arms. This study does not address cardiovascular outcomes when doxazosin is combined with other antihypertensive medications. Consideration should be given to the ALLHAT results when considering the use of an alpha$_1$-blocker for treatment of hypertension.

Medication Safety Issues

Sound-alike/look-alike issues:

Terbinafine may be confused with terbutaline

Lamisil® may be confused with Lamictal®, Lomotil®

International issues:

Lamisil® may be confused with Lemesil® which is a brand name for nimesulide in Greece and Romania

Pronunciation(TER bin a feen)

U.S. Brand NamesLamisil AT® [OTC]; Lamisil®

Canadian Brand NamesApo-Terbinafine®; CO Terbinafine; Gen-Terbinafine; Lamisil®; Novo-Terbinafine; PHL-Terbinafine; PMS-Terbinafine; RIVA-Terbinafine; SANDOZ-Terbinafine; Terbinafine-250

Pharmacologic CategoryAntifungal Agent, Oral; Antifungal Agent, Topical

Use: Labeled IndicationsActive against most strains of *Trichophyton mentagrophytes*, *Trichophyton rubrum*; may be effective for infections of *Microsporum gypseum* and *M. nanum*, *Trichophyton verrucosum*, *Epidermophyton floccosum*, *Candida albicans*, and *Scopulariopsis brevicaulis*

Oral: Onychomycosis of the toenail or fingernail due to susceptible dermatophytes; treatment of tinea capitis

Topical: Antifungal for the treatment of tinea pedis (athlete's foot), tinea cruris (jock itch), and tinea corporis (ringworm) [OTC/prescription formulations]; tinea versicolor [prescription formulations]

Dosing: Adults

Superficial mycoses (onychomycosis): Oral:

Fingernail: 250 mg daily for up to 6 weeks; may be given in 2 divided doses

Toenail: 250 mg daily for 12 weeks; may be given in 2 divided doses

Systemic mycosis (unlabeled use): Oral: 250-500 mg/day for up to 16 months

Athlete's foot (tinea pedis): Topical:

Cream: Apply to affected area twice daily for at least 1 week, not to exceed 4 weeks [OTC/prescription formulations]

Gel: Apply to affected area twice daily for 7 days [OTC formulations]

Solution: Apply to affected area twice daily for 7 days [OTC/prescription formulations]

Ringworm and jock itch (tinea corporis, tinea cruris): Topical:

Cream: Apply to affected area once or twice daily for at least 1 week, not to exceed 4 weeks [OTC formulations]

Gel: Apply to affected area once daily for 7 days [OTC formulations]

Solution: Apply to affected area once daily for 7 days in tinea corporis and tinea cruris [OTC formulations]; apply to affected area twice daily for 7 days in tinea versicolor [prescription formulation]

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Tinea capitis: Oral: Granules: Children ≥4 years:

<25 kg: 125 mg once daily for 6 weeks

25-35 kg: 187.5 mg once daily for 6 weeks

>35 kg: 250 mg once daily for 6 weeks

Onychomycosis (unlabeled use): Oral: Tablet: Children:

10-20 kg: 62.5 mg once daily for 6 weeks (fingernails) **or** 12 weeks (toenails)

20-40 kg: 125 mg once daily for 6 weeks (fingernails) **or** 12 weeks (toenails)

>40 kg: 250 mg once daily for 6 weeks (fingernails) **or** 12 weeks (toenails)

Athlete's foot (tinea pedis), ringworm (tinea corporis), jock itch (tinea cruris): Topical cream, gel, solution: Children ≥12 years: Refer to adult dosing:

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Oral administration is not recommended; clearance is decreased by ~50%.

Dosing: Hepatic ImpairmentHepatic cirrhosis: Oral administration is not recommended; clearance is decreased by ~50%.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTablets may be administered without regard to meals. Granules should be sprinkled on a spoonful of nonacidic food (eg, mashed potatoes); swallow granules without chewing.

Storage

Cream: Store at 5°C to 30°C (41°F to 86°F).

Granules: Store at controlled room temperature if 15°C to 30°C (59°F to 86°F).

Solution: Store at 5°C to 25°C (41°F to 77°F); do not refrigerate.

Tablet: Store below 25°C (77°F). Protect from light.

ContraindicationsHistory of or allergic reaction to oral terbinafine

Warnings/Precautions

Concerns related to adverse effects:

- Allylamine antifungal hypersensitivity: Use caution in patients sensitive to allylamine antifungals (eg, naftifine, butenafine); cross sensitivity to terbinafine may exist

- Dermatologic effects: Although rare, Stevens-Johnson syndrome and toxic epidermal necrolysis have been reported with oral use; discontinue therapy if progressive skin rash occurs.

- Hematologic effects: Although rare, pancytopenia and neutropenia have been reported with oral use; discontinuation of therapy may be required. Monitor CBCs in patients with pre-existing immunosuppression if use to continue >6 weeks.

- Hepatic failure: Rare cases of hepatic failure (including fatal cases) have been reported following oral treatment; not recommended for use in patients with active or chronic liver disease. Discontinue if symptoms or signs of hepatobiliary dysfunction or cholestatic hepatitis develop.

- Ocular effects: Although rare, changes in the ocular lens and retina have been reported with oral use; discontinuation of therapy may be required.

Disease-related concerns:

- Hepatic cirrhosis: Use of oral therapy not recommended in patients with hepatic cirrhosis; clearance is reduced by approximately 50%.

- Lupus: Precipitation or exacerbation of cutaneous or systemic lupus erythematosus has been observed with oral therapy; discontinue if signs and/or symptoms develop.

- Renal dysfunction: Use of oral therapy not recommended in patients with renal dysfunction (Cl_{cr} ≤50 mL/minute); clearance is reduced by approximately 50%.

Geriatric ConsiderationsNo specific information on the systemic use of terbinafine in the elderly is available; however, since many elderly will have creatinine clearances <50 mL/minute, this drug is not a drug of choice for elderly with onychomycosis.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Avoid use in pregnancy since treatment of onychomycosis is postponable.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsAlthough minimal concentrations of terbinafine cross into breast milk after topical use, oral or topical treatment during lactation should be avoided.

Adverse Reactions

Oral: Adverse events listed for tablets unless otherwise specified. Oral granules were studied in patients 4-12 years of age.

>10%: Central nervous system: Headache (13%; granules 7%)

1% to 10%:

Central nervous system: Fever (granules 7%)

Dermatologic: Rash (6%; granules 2%), pruritus (3%; granules 1%), urticaria (1%)

Gastrointestinal: Diarrhea (6%; granules 3%), vomiting (granules 5%), dyspepsia (4%), nausea (3%; granules 2%), taste disturbance (3%), abdominal pain (2%; granules 2% to 4%), toothache (granules 1%)

Hepatic: Liver enzyme abnormalities (3%)

Respiratory: Nasopharyngitis (granules 10%), cough (granules 6%), nasal congestion (granules 2%), pharyngeal pain (granules 2%), rhinorrhea (granules 2%)

<1%, postmarketing, and/or case reports: Acute pancreatitis, anemia, angioedema, agranulocytosis, allergic reactions, alopecia, anaphylaxis, appetite decreased, arthralgia, dizziness, fatigue, generalized exanthematous pustulosis (acute), hepatic failure, malaise, myalgia, neutropenia (severe), ocular lens and retina changes, precipitation/exacerbation of cutaneous and systemic lupus erythematosus, pancytopenia, psoriasiform eruption, psoriasis exacerbation, rhabdomyolysis, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, visual field acuity decreased, visual field defects, vomiting

Topical: 1% to 10%:

Dermatologic: Burning, contact dermatitis, dryness, exfoliation, irritation, pruritus, rash

Local: Irritation, stinging

Metabolism/Transport Effects**Substrate** (minor) of 1A2, 2C9, 2C19, 3A4; **Inhibits** CYP2D6 (strong); **Induces** CYP3A4 (weak)

Drug Interactions

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CycloSPORINE: Terbinafine may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Terbinafine. *Risk D: Consider therapy modification*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Terbinafine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Monitoring ParametersAST/ALT prior to initiation, repeat if used >6 weeks; CBC

Nursing: Physical Assessment/MonitoringUse oral formulation with caution in presence of hepatic or renal impairment. Assess potential for interactions with other pharmacological or herbal agents patient may be taking (eg, risk of toxicity, decreased effects). Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse reactions at beginning of therapy and on a regular basis during therapy (adverse reactions may require discontinuing treatment). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsAST/ALT prior to initiation, repeat if used >6 weeks; CBC

Patient EducationDo not take any new prescriptions, OTC medications, or herbal products during therapy unless approved by prescriber. Oral: Take exactly as directed at same time of day, with or without regard to meals. Granules may be sprinkled on a spoonful of nonacidic food (eg, mashed potatoes); swallow granules without chewing. It is important to take full prescription even if symptoms appear resolved; may take several months for full treatment (inadequate treatment may result in reinfection). May cause altered taste (normal); nausea, vomiting, or abdominal pain (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea). Report unusual fatigue; persistent gastrointestinal upset; nasal congestion, runny nose, sore throat, or unusual cough; skin rash or blistering; dark urine/pale stool; or other persistent adverse response. **Breast-feeding precaution:** Breast-feeding is not recommended.

Topical: Cream, gel, or spray for topical use only. Use exactly as directed (see package insert). Wash and dry area thoroughly before applying. Avoid contact with eyes, nose, or mouth. Do not use occlusive dressings. Report irritation, itching, or burning in treated area.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical, as hydrochloride: 1% (12 g, 24 g)

Lamisil AT®: 1% (12 g, 15 g, 24 g, 30 g, 36 g) [contains benzyl alcohol]

Gel, topical:

Lamisil AT®: 1% (6 g, 12 g) [contains benzyl alcohol]

Granules, oral:

Lamisil® 125 mg/packet (42s); 187.5 mg/packet (42s)

Solution, topical, as hydrochloride [spray]:

Lamisil AT®: 1% (30 mL) [contains ethanol]

Tablet, oral: 250 mg

Lamisil®: 250 mg

Generic AvailableYes: Excludes gel, granules, and solution
Pricing: U.S. (www.drugstore.com)

Solution (Lamisil)

1% (30): $77.03

Tablets (Lamisil)

250 mg (30): $392.99

Tablets (Terbinafine HCl)

250 mg (30): $48.98

Mechanism of ActionSynthetic allylamine derivative which inhibits squalene epoxidase, a key enzyme in sterol biosynthesis in fungi. This results in a deficiency in ergosterol within the fungal cell wall and results in fungal cell death.
Pharmacodynamics/Kinetics

Absorption: Topical: Limited (<5%); Oral: >70% (children and adults)

Distribution: V_d: 1000 L; distributed to sebum and skin predominantly

Protein binding: Plasma: >99% (children and adults)

Metabolism: Hepatic; no active metabolites; first-pass effect; little effect on CYP

Bioavailability: Oral: 40% (children 36% to 64%)

Half-life elimination:

Topical: 14-35 hours

Oral: Terminal half-life: 200-400 hours; very slow release of drug from skin and adipose tissues occurs; effective half-life: ~36 hours (children 27-31 hours)

Time to peak, plasma: 1-2 hours (children and adults)

Excretion: Urine (70% to 75%; children 70%)

Related Information

- Antifungal Agents

Pharmacotherapy PearlsDue to potential toxicity, the manufacturer recommends confirmation of diagnosis testing of nail specimens prior to treatment of onychomycosis. Patients should not be considered therapeutic failures until they have been symptom-free for 2-4 weeks off following a course of treatment; GI complaints usually subside with continued administration.

A meta-analysis of efficacy studies for toenail infections revealed that weighted average mycological cure rates for continuous therapy were 36.7% (griseofulvin), 54.7% (itraconazole), and 77% (terbinafine). Cure rate for 4-month pulse therapy for itraconazole and terbinafine were 73.3% and 80%. Additionally, the final outcome measure of final costs per cured infections for continuous therapy was significantly lower for terbinafine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disturbance.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay rarely cause pancytopenia and neutropenia; use caution with clozapine and carbamazepine. May cause GI side effects; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects. Terbinafine is a potent CYP2D6 inhibitor and may decrease the metabolism of thioridazine and tricyclic antidepressants; combined use with thioridazine should be avoided.
Index TermsTerbinafine Hydrochloride

Terbutaline

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Terbutaline may be confused with terbinafine, TOLBUTamide

Pronunciation(ter BYOO ta leen)

Canadian Brand NamesBricanyl®

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsBronchodilator in reversible airway obstruction and bronchial asthma

Use: Unlabeled/InvestigationalTocolytic agent (management of preterm labor)

Dosing: Adults

Asthma or bronchoconstriction:

Oral: 5 mg/dose every 6 hours 3 times/day; if side effects occur, reduce dose to 2.5 mg every 6 hours; not to exceed 15 mg in 24 hours.

SubQ: 0.25 mg/dose; may repeat in 15-30 minutes (maximum: 0.5 mg/4-hour period)

Bronchospasm (acute): *Inhalation* (Bricanyl® [CAN] MDI: 500 mcg/puff, *not labeled for use in the U.S.*): One puff as needed; may repeat with 1 inhalation (after 5 minutes); more than 6 inhalations should not be necessary in any 24 hour period. **Note:** If a previously effective dosage regimen fails to provide the usual relief, or the effects of a dose last for >3 hours, medical advice should be sought immediately; this is a sign of seriously worsening asthma that requires reassessment of therapy.

Premature labor (tocolysis; unlabeled use):

Acute: I.V. 2.5-10 mcg/minute; increased gradually every 10-20 minutes. Effective maximum dosages from 17.5-30 mcg/minute have been use with caution. Duration of infusion is at least 12 hours.

Maintenance: Oral: 2.5-10 mg every 4-6 hours for as long as necessary to prolong pregnancy depending on patient tolerance

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asthma or bronchoconstriction:

Oral: Children:

<12 years: Initial: 0.05 mg/kg/dose 3 times/day, increased gradually as required; maximum: 0.15 mg/kg/dose 3-4 times/day or a total of 5 mg/24 hours

12-15 years: 2.5 mg every 6 hours 3 times/day; not to exceed 7.5 mg in 24 hours

>15 years: 5 mg/dose every 6 hours 3 times/day; if side effects occur, reduce dose to 2.5 mg every 6 hours; not to exceed 15 mg in 24 hours

SubQ: Children:

<12 years: 0.005-0.01 mg/kg/dose to a maximum of 0.3 mg/dose; may repeat in 15-20 minutes

≥12 years: Refer to adult dosing.

Bronchospasm (acute):*Inhalation:* Bricanyl® [CAN] MDI: 500 mcg/puff, *not labeled for use in the U.S.*): Children ≥6 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl$_{cr}$ 10-50 mL/minute: Administer 50% of normal dose.

Cl$_{cr}$ <10 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Use infusion pump.

Administration: I.V. DetailpH: 3-5 (adjusted)

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

StorageStore injection at room temperature; do not freeze. Protect from heat and light. Use only clear solutions. Store powder for inhalation

(Bricanyl® Turbuhaler [CAN]) at room temperature between 15°C and 30°C (58°F and 86°F).

CompatibilityStable in D_5W, $^1/_2$NS, NS.

Y-site administration: Compatible: Insulin (regular).

Compatibility in syringe: Compatible: Doxapram.

Compatibility when admixed: Compatible: Aminophylline. **Incompatible:** Bleomycin.

Extemporaneously PreparedA 1 mg/mL suspension made from terbutaline tablets in simple syrup NF is stable 30 days when refrigerated

Horner RK and Johnson CE, "Stability of An Extemporaneously Compounded Terbutaline Sulfate Oral Liquid," *Am J Hosp Pharm*, 1991, 48(2):293-5.

ContraindicationsHypersensitivity to terbutaline or any component of the formulation; cardiac arrhythmias associated with tachycardia; tachycardia caused by digitalis intoxication

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.
- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Asthma: Appropriate use: When used as a bronchodilator, optimize anti-inflammatory treatment before initiating maintenance treatment with terbutaline. Do not use as a component of chronic therapy without an anti-inflammatory agent. Only the mildest form of asthma (Step 1 and/or exercise-induced) would not require concurrent use based upon asthma guidelines.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta_2-agonists may also increase risk of arrhythmias.
- Diabetes: Use with caution in patients with diabetes mellitus; beta_2-agonists may increase serum glucose.
- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.
- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.
- Hypokalemia: Use with caution in patients with hypokalemia; beta_2-agonists may decrease serum potassium.
- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Other warnings/precautions:

- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma, and treatment must not be delayed.
- Tocolysis use: When used for tocolysis, there is some risk of maternal pulmonary edema, which has been associated with the following risk factors, excessive hydration, multiple gestation, occult sepsis and underlying cardiac disease. To reduce risk, limit fluid intake to 2.5-3 L/day, limit sodium intake, maintain maternal pulse to <130 beats/minute.

Geriatric ConsiderationsOral terbutaline should be avoided in the elderly due to the increased incidence of adverse effects as compared to the inhaled form.

Pregnancy Risk FactorB

LactationEnters breast milk/compatible

Adverse Reactions

>10%:

Central nervous system: Nervousness, restlessness

Endocrine & metabolic: Serum glucose increased, serum potassium decreased

Neuromuscular & skeletal: Trembling

1% to 10%:

Cardiovascular: Tachycardia, hypertension

Central nervous system: Dizziness, drowsiness, headache, insomnia

Gastrointestinal: Xerostomia, nausea, vomiting, bad taste in mouth

Neuromuscular & skeletal: Muscle cramps, weakness

Miscellaneous: Diaphoresis

<1%: Chest pain, arrhythmia, hypokalemia, paradoxical bronchospasm

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation).

Monitoring ParametersSerum potassium, glucose; heart rate, blood pressure, respiratory rate; monitor for signs and symptoms of pulmonary edema (when used as a tocolytic); monitor FEV$_1$, peak flow, and/or other pulmonary function tests (when used as bronchodilator)

Nursing: Physical Assessment/Monitoring**Respiratory use:** Assess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. If you have diabetes, monitor blood glucose (may cause elevation in serum glucose). For inpatient care, monitor vital signs and lung sounds prior to and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Preterm labor use: Inpatient:** Monitor maternal vital signs; respiratory, fluid status, cardiac, and electrolyte status; frequency, duration, and intensity of contractions; and fetal heart rate. **Outpatient:** Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFEV$_1$, peak flow, and/or other pulmonary function tests; serum potassium, serum glucose (in selected patients)

Tocolysis: If patient receives therapy for more than 1 week, monitor serum glucose.

Patient EducationUse exactly as directed. Do not use more often than recommended (excessive use may result in tolerance, overdose may result in serious adverse effects) and do not discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, monitor blood sugar closely. Serum glucose may be elevated. You may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth, stomach upset (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report unresolved GI upset; dizziness or fatigue; vision changes; sudden weight gain; swelling of extremities; chest pain, rapid heartbeat, or palpitations; insomnia, nervousness, or hyperactivity; muscle cramping, tremors, or pain; unusual cough; or rash (hypersensitivity).

Preterm labor: Notify prescriber immediately if labor resumes or adverse side effects are noted

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution, as sulfate: 1 mg/mL (1 mL)

Powder for oral inhalation:

Bricanyl® Turbuhaler [CAN]: 500 mcg/actuation [50 or 200 metered actuations] [not available in U.S.]

Tablet, as sulfate: 2.5 mg, 5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Brethine)

2.5 mg (90): $43.47

Tablets (Terbutaline Sulfate)

2.5 mg (90): $44.99

5 mg (90): $45.99

Mechanism of ActionRelaxes bronchial smooth muscle by action on beta$_2$-receptors with less effect on heart rate

Pharmacodynamics/Kinetics

Onset of action: Oral: 30-45 minutes; SubQ: 6-15 minutes

Protein binding: 25%

Metabolism: Hepatic to inactive sulfate conjugates

Bioavailability: SubQ doses are more bioavailable than oral

Half-life elimination: 11-16 hours

Excretion: Urine

Related Information

- Bronchodilators
- Inhalant Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and bad taste in mouth.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusRestlessness and nervousness are common; may cause dizziness, drowsiness, or insomnia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with TCAs or MAO inhibitors may increase toxicity

Cardiovascular ConsiderationsBeta-agonists will induce increases in heart rate. This should be considered in patients with resting tachycardia. Because of the frequent coexistence of chronic obstructive lung disease and coronary artery disease, many patients are on simultaneous therapy with beta-agonists and beta-blockade.

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information: Beta$_2$-selective agents lose much of their receptor selectivity when delivered parenterally or orally. Subcutaneous beta-agonist therapy has a deleterious therapeutic to toxicity ratio when compared with inhalation. There is no proven benefit of systemic therapy over aerosolized (Expert Report Panel 3, 2007).

Terconazole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Terconazole may be confused with tioconazole

International issues:

Terazol® may be confused with Theradol® which is a brand name for tramadol in the Netherlands

Pronunciation(ter KONE a zole)
U.S. Brand NamesTerazol® 3; Terazol® 7; Zazole™
Canadian Brand NamesTerazol®
Pharmacologic CategoryAntifungal Agent, Vaginal
Use: Labeled IndicationsLocal treatment of vulvovaginal candidiasis
Dosing: Adults**Vulvovaginal candidiasis:** Intravaginal:

Terazol® 3, Zazole™ (0.8%) vaginal cream: Insert 1 applicatorful intravaginally at bedtime for 3 consecutive days.

Terazol® 7, Zazole™ (0.4%) vaginal cream: Insert 1 applicatorful intravaginally at bedtime for 7 consecutive days.

Terazol® 3 vaginal suppository: Insert 1 suppository intravaginally at bedtime for 3 consecutive days.

Dosing: ElderlyRefer to adult dosing.
StorageStore at room temperature of 13°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to terconazole or any component of the formulation
Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: If irritation or sensitization occurs, discontinue use.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Petrolatum-based: Petrolatum-based vaginal products may damage rubber or latex condoms or diaphragms; separate use by 3 days.

Other warnings/precautions:

- Lack of response: Microbiological studies (KOH smear and/or cultures) should be repeated in patients not responding to terconazole in order to confirm the diagnosis and rule out other pathogens.

Geriatric ConsiderationsAssess patient's ability to self-administer; may be difficult in patients with arthritis or limited range of motion.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

1% to 10%:

Central nervous system: Fever, chills

Gastrointestinal: Abdominal pain

Genitourinary: Vulvar/vaginal burning, dysmenorrhea

<1% (Limited to important or life-threatening): Vulvar itching, soreness, edema, or discharge; polyuria; burning or itching of penis of sexual partner; flu-like syndrome

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate administration, possible side effects/interventions,

and adverse symptoms to report.

Patient EducationComplete full course of therapy as directed. Insert vaginally as directed by prescriber or see package insert. Sexual partner may experience irritation of penis; best to refrain from intercourse during period of treatment. Suppositories may cause breakdown of rubber/latex products such as diaphragms; avoid concurrent use. Report persistent vaginal burning, itching, irritation, or discharge. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, vaginal: 0.4% (45 g); 0.8% (20 g)

Terazol® 7: 0.4% (45 g) [packaged with measured-dose applicator]

Terazol® 3: 0.8% (20 g) [packaged with measured-dose applicator]

Zazole™: 0.4% (45 g) [packaged with measured-dose applicator]; 0.8% (20 g) [packaged with measured-dose applicator]

Suppository, vaginal:

Terazol® 3: 80 mg (3s) [may contain coconut and/or palm kernel oil]

Generic AvailableYes: Cream

Pricing: U.S. (www.drugstore.com)

Cream (Terazol 3)

0.8% (20): $55.99

Cream (Terazol 7)

0.4% (45): $51.99

Cream (Terconazole)

0.4% (45): $38.07

0.8% (20): $34.99

Suppository (Terazol 3)

80 mg (3): $51.99

Suppository (Terconazole)

80 mg (3): $45.99

Mechanism of ActionTriazole ketal antifungal agent; involves inhibition of fungal cytochrome P450. Specifically, terconazole inhibits cytochrome P450-dependent 14-alpha-demethylase which results in accumulation of membrane disturbing 14-alpha-demethylsterols and ergosterol depletion.

Pharmacodynamics/KineticsAbsorption: Extent of systemic absorption after vaginal administration may be dependent on presence of a uterus; 5% to 8% in women who had a hysterectomy versus 12% to 16% in nonhysterectomy women

Related Information

- Treatment of Sexually-Transmitted Infections

Pharmacotherapy PearlsWatch for local irritation; assist patient in administration, if necessary; assess patient's ability to self-administer, may be difficult in patients with arthritis or limited range of motion

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTriaconazole

International Brand NamesFungistat (CO, MX, VE); Fungistat 3 (BB, BM, BS, BZ, GY, JM, PR, SR, TT); Gyno-Fungix (AR, BR); Gyno-Terazol (BE, CH, CZ, LU, NL, PL); Terazol (DK, FI); Terconal (IT); Terconer (TW)

Teriparatide

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ter i PAR a tide)

U.S. Brand NamesForteo®

Canadian Brand NamesForteo®

Pharmacologic CategoryParathyroid Hormone Analog

Use: Labeled IndicationsTreatment of osteoporosis in postmenopausal women at high risk of fracture; treatment of primary or hypogonadal osteoporosis in men at high risk of fracture

Dosing: Adults**Osteoporosis:** SubQ: 20 mcg once daily; **Note:** Initial administration should occur under circumstances in which the patient may sit or lie down, in the event of orthostasis.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required. Bioavailability and half-life increase with Cl_{cr} <30 mL/minute.

Administration: OtherAdminister by subcutaneous injection into the thigh or abdominal wall. Initial administration should occur under circumstances in which the patient may sit or lie down, in the event of orthostasis.

StorageStore at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Discard pen 28 days after first injection. Do not use if solution is cloudy, colored or contains solid particles.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to teriparatide or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Osteosarcoma: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia). Transient orthostatic hypotension usually occurs within 4 hours of dosing and within the first several doses.

- Osteosarcoma: **[U.S. Boxed Warning]: In animal studies, teriparatide has been associated with an increase in osteosarcoma;** risk was dependent on both dose and duration. Avoid use in patients with an increased risk of osteosarcoma (including Paget's disease, prior radiation, unexplained elevation of alkaline phosphatase, or in patients with open epiphyses). Do not use in patients with a history of skeletal metastases, hyperparathyroidism, or pre-existing hypercalcemia. Exclude metabolic bone disease other than osteoporosis prior to initiating therapy. Not for use in patients with metabolic bone disease other than osteoporosis.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; limited data available concerning safety and efficacy.

- Hepatic impairment: Use with caution in patients with hepatic impairment; limited data available concerning safety and efficacy.

- Renal impairment: Use with caution in patients with renal impairment; limited data available concerning safety and efficacy.

- Urolithiasis: Use with caution in patients with active or recent urolithiasis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Use of teriparatide for longer than 2 years is not recommended.

Geriatric ConsiderationsNo age-related differences in pharmacokinetics have been seen. In studies, no significant difference was seen in either efficacy or adverse effects between older patients and younger patients. Teriparatide should be considered as a last resort in patents who cannot tolerate or have not responded to other treatments for osteoporosis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in animal studies; the effect on human fetal development has not been studied. Teriparatide is not indicated for use in pregnant or premenopausal women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIndicated for use in postmenopausal women. Studies have not been conducted to determine excretion in breast milk. Not recommended for use in breast-feeding women.

Adverse Reactions

>10%: Endocrine & metabolic: Hypercalcemia (transient increases noted 4-6 hours postdose [women 11%; men 6%])

1% to 10%:

- Cardiovascular: Chest pain (3%), syncope (3%)
- Central nervous system: Dizziness (8%), depression (4%), vertigo (4%)
- Dermatologic: Rash (5%)
- Endocrine & metabolic: Hyperuricemia (3%)
- Gastrointestinal: Nausea (9%), dyspepsia (5%), vomiting (3%), tooth disorder (2%)
- Neuromuscular & skeletal: Arthralgia (10%), weakness (9%), leg cramps (3%), muscle spasm
- Respiratory: Rhinitis (10%), pharyngitis (6%), dyspnea (4%), pneumonia (4%)
- Miscellaneous: Antibodies to teriparatide (3% of women in long-term treatment; hypersensitivity reactions or decreased efficacy were not associated in preclinical trials)

Postmarketing and/or case reports: Acute dyspnea, allergic reactions, edema (facial/oral), hypercalcemia >11 mg/dL; injection site reactions (bleeding, bruising, erythema, pain, pruritus, swelling); urticaria

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb Interactions

Ethanol: Excessive intake may increase risk of osteoporosis.

Herb/Nutraceutical: Ensure adequate calcium and vitamin D intake.

Test InteractionsTransiently increases serum calcium; maximal effect 4-6 hours postdose; generally returns to baseline ~16 hours postdose

Monitoring ParametersSerum calcium, serum phosphorus, uric acid; blood pressure; bone mineral density

Nursing: Physical Assessment/MonitoringInitial administration should occur where patient may sit or lie down, in the event of orthostasis. Assess results of laboratory tests (eg, calcium and phosphorus levels) prior to and periodically during therapy. Assess therapeutic effectiveness and adverse response (eg, chest pain, hypotension, nausea, vomiting, arthralgia, leg cramps, dyspnea) at beginning of and regular intervals during therapy. Teach patient proper use (administration with injector "pen" and disposal), possible side effects/appropriate interventions (diet with adequate calcium and vitamin D), and adverse symptoms to report.

Monitoring: Lab TestsSerum calcium, serum phosphorus

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use injector pen and dispose of pen exactly as instructed (refer to Forteo® user manual dispensed with the medication); rotate injection sites in thigh or abdominal wall. Sit when administering to reduce possibility of falling or injury. Avoid excess alcohol (may increase risk of osteoporosis) and follow dietary instructions of prescriber. May cause dizziness (use caution when driving or engaged in potentially hazardous tasks until response to drug is known); nausea, vomiting, or upset stomach (small frequent meals or frequent mouth care may help); muscle or skeletal pain, weakness, or cramping (consult prescriber for approved analgesic). Report chest pain or palpitations; respiratory difficulty; or other persistent adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Forteo®: 250 mcg/mL (3 mL) [prefilled syringe, delivers teriparatide 20 mcg/dose]

Generic AvailableNo

ManufacturerEli Lilly and Company

Pricing: U.S. (www.drugstore.com)

Solution (Forteo)

750 mcg/3 mL (3): $899.44

Mechanism of ActionTeriparatide is a recombinant formulation of endogenous parathyroid hormone (PTH), containing a 34-amino-acid sequence which is identical to the N-terminal portion of this hormone. The pharmacologic activity of teriparatide is similar to the physiologic activity of PTH, stimulating osteoblast function, increasing gastrointestinal calcium absorption, increasing renal tubular reabsorption of calcium. Treatment with teriparatide increases bone mineral density, bone mass, and strength. In postmenopausal women, it has been shown to decrease osteoporosis-related fractures.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.12 L/kg

Metabolism: Hepatic (nonspecific proteolysis)

Bioavailability: 95%

Half-life elimination: Serum: I.V.: 5 minutes; SubQ: 1 hour

Time to peak, serum: 30 minutes

Excretion: Urine (as metabolites)

Pharmacotherapy Pearls Teriparatide was formerly marketed as a diagnostic agent (Perithar™); that agent was withdrawn from the market in 1997. Teriparatide (Forteo®) is manufactured through recombinant DNA technology using a strain of *E. coli*.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Tooth disorder.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness or depression

Mental Health: Effects on Psychiatric Treatment May cause orthostasis; use caution with psychotropics. May cause GI side effects; use caution with SSRIs.

Index Terms Parathyroid Hormone (1-34); Recombinant Human Parathyroid Hormone (1-34); rhPTH(1-34)

Testolactone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Testolactone may be confused with testosterone

Pronunciation(tes toe LAK tone)
U.S. Brand NamesTeslac® [DSC]
Canadian Brand NamesTeslac®
Pharmacologic CategoryAndrogen
Use: Labeled IndicationsPalliative treatment of advanced or disseminated breast carcinoma
Dosing: Adults**Breast carcinoma (palliative):** Females: Oral: 250 mg 4 times/day for at least 3 months; desired response may take as long as 3 months.
Dosing: ElderlyRefer to adult dosing.
RestrictionsC-III
ContraindicationsHypersensitivity to testolactone or any component of the formulation; treatment of breast cancer in men
Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Porphyria: Use with caution in patients with a history of porphyria.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Women: For use in postmenopausal women or in premenopausal women without ovarian function only.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Testolactone should only be used in postmenopausal women; use during pregnancy is not recommended.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Blood pressure increased, edema

Central nervous system: Malaise

Dermatologic: Alopecia (rare), maculopapular rash

Endocrine & metabolic: Hypercalcemia

Gastrointestinal: Anorexia, diarrhea, nausea, tongue edema

Neuromuscular & skeletal: Paresthesia, peripheral neuropathy

Miscellaneous: Nail growth disturbance (rare)

Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsPlasma estradiol concentrations by RIA

Monitoring ParametersPlasma calcium levels

Nursing: Physical Assessment/MonitoringFor use in postmenopausal women or in premenopausal women without ovarian function only. May increase effects of oral anticoagulants. Evaluate effectiveness of therapy, laboratory tests, and adverse reactions. Assess knowledge/teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPlasma calcium levels

Patient EducationTake as directed; do not discontinue without consulting prescriber. Effectiveness of therapy may take several months. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and diet and exercise program recommended by prescriber. You may experience nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report fluid retention (swelling of ankles, feet, or hands; respiratory difficulty or sudden weight gain); numbness, tingling, or swelling of fingers, toes, or face; skin rash, redness, or irritation; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet:

Teslac®: 50 mg [DSC]

Generic AvailableNo

Mechanism of ActionTestolactone is a synthetic testosterone derivative without significant androgen activity. The drug inhibits steroid aromatase activity, thereby blocking the production of estradiol and estrone from androgen precursors such as testosterone and androstenedione. Unfortunately, the enzymatic block provided by testolactone is transient and is usually limited to a period of 3 months.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Metabolism: Hepatic (forms metabolites)

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tongue edema.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Pronunciation(tes TOS ter one)

U.S. Brand NamesAndroderm®; AndroGel®; Delatestryl®; Depo®-Testosterone; First®-Testosterone; First®-Testosterone MC; Striant®; Testim®; Testopel®

Canadian Brand NamesAndriol®; Androderm®; AndroGel®; Andropository; Delatestryl®; Depotest® 100; Everone® 200; Virilon® IM

Pharmacologic CategoryAndrogen

Use: Labeled Indications

Injection: Androgen replacement therapy in the treatment of delayed male puberty; male hypogonadism (primary or hypogonadotropic); inoperable metastatic female breast cancer (enanthate only)

Pellet: Androgen replacement therapy in the treatment of delayed male puberty; male hypogonadism (primary or hypogonadotropic)

Topical (buccal system, gel, transdermal system): Male hypogonadism (primary or hypogonadotropic)

Capsule (not available in U.S.): Androgen replacement therapy in the treatment of delayed male puberty; male hypogonadism (primary or hypogonadotropic); replacement therapy in impotence or for male climacteric symptoms due to androgen deficiency

Use: Unlabeled/InvestigationalAndrogen deficiency in men with AIDS wasting; postmenopausal women with decreased sexual desire (in combination with estrogen therapy)

Dosing: Adults

Inoperable metastatic breast cancer (females):*I.M. (testosterone enanthate):* 200-400 mg every 2-4 weeks

Hypogonadism:

I.M. (testosterone enanthate or testosterone cypionate): 50-400 mg every 2-4 weeks (FDA-approved dosing range); 75-100 mg/week or 150-200 mg every 2 weeks (per practice guidelines)

Pellet (for subcutaneous implantation): 150-450 mg every 3-6 months

Hypogonadism or hypogonadotropic hypogonadism (males):

Oral capsule (Andriol®; not available in U.S.): Initial: 120-160 mg/day in 2 divided doses for 2-3 weeks; adjust according to individual response; usual maintenance dose: 40-120 mg/day (in divided doses)

Topical:

Buccal: 30 mg twice daily (every 12 hours) applied to the gum region above the incisor tooth

Transdermal system: Androderm®: Initial: Apply 5 mg/day once nightly to clean, dry area on the back, abdomen, upper arms, or thighs (do **not** apply to scrotum); dosing range: 2.5-7.5 mg/day; in nonvirilized patients, dose may be initiated at 2.5 mg/day

Gel: AndroGel®, Testim®: 5 g (to deliver 50 mg of testosterone with 5 mg systemically absorbed) applied once daily (preferably in the morning) to clean, dry, intact skin of the shoulder and upper arms. AndroGel® may also be applied to the abdomen. Dosage may be increased to a maximum of 10 g (100 mg). **Do not apply testosterone gel to the genitals.**

Dose adjustment based on testosterone levels:

Less than normal range: Increase dose from 5 g to 7.5 g to 10 g

Greater than normal range: Decrease dose. Discontinue if consistently above normal at 5 g/day

Delayed puberty (males):

I.M. (testosterone enanthate): 50-200 mg every 2-4 weeks for a limited duration

Oral capsule (Andriol®; not available in U.S.): Initial: 120-160 mg/day in 2 divided doses for 2-3 weeks; adjust according to individual response; usual maintenance dose: 40-120 mg/day (in divided doses)

Pellet (for subcutaneous implantation): 150-450 mg every 3-6 months

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Delayed puberty (males):

I.M. (testosterone enanthate): Refer to adult dosing.

Oral capsule (Andriol®; not available in U.S.): Refer to adult dosing.

Pellet (for subcutaneous implantation): Refer to adult dosing.

Hypogonadism:

I.M. (testosterone enanthate or testosterone cypionate): Refer to adult dosing.

Pellet (for subcutaneous implantation): Refer to adult dosing.

Hypogonadism or hypogonadotropic hypogonadism (males):*Oral capsule (Andriol®; not available in U.S.):* Refer to adult dosing.

Dosing: Hepatic ImpairmentReduce dose.

Administration: I.M.Warm injection to room temperature and shaking vial will help redissolve crystals that have formed after storage. Administer by deep I.M. injection into the upper outer quadrant of the gluteus maximus.

Administration: Oral

Oral, buccal application (Striant®): One mucoadhesive for buccal application (buccal system) should be applied to a comfortable area above the incisor tooth. Apply flat side of system to gum. Rotate to alternate sides of mouth with each application. Hold buccal system firmly in place for 30 seconds to ensure adhesion. The buccal system should adhere to gum for 12 hours. If the buccal system falls out, replace with a new system. If the system falls out within 4 hours of next dose, the new buccal system should remain in place until the time of the following scheduled dose. System will soften and mold to shape of gum as it absorbs moisture from mouth. Do not chew or swallow the buccal system. The buccal system will not dissolve; gently remove by sliding downwards from gum; avoid scratching gum.

Oral, capsule (Andriol®; not available in the U.S.): Should be administered with meals. Should be swallowed whole; do not crush or chew.

Administration: Topical

Transdermal patch: Androderm®: Apply patch to clean, dry area of skin on the arm, back, or upper buttocks. Following patch removal, mild skin irritation may be treated with OTC hydrocortisone cream. A small amount of triamcinolone acetonide 0.1% cream may be applied under the system to decrease irritation; do not use ointment. Patch should be applied nightly. Rotate administration sites, allowing 7 days between applying to the same site.

Gel: AndroGel®, Testim®: Apply (preferably in the morning) to clean, dry, intact skin of the shoulder and upper arms (AndroGel® may also be applied to the abdomen). Apply at the same time each day. Upon opening the packet(s), the entire contents should be squeezed into the palm of the hand and immediately applied to the application site(s). Alternatively, a portion may be squeezed onto palm of hand and applied, repeating the process until entire packet has been applied. Application sites should be allowed to dry for a few minutes prior to dressing. Hands should be washed with soap and water after application. **Do not apply testosterone gel to the genitals**. For optimal absorption, after application wait at least 5-6 hours prior to showering or swimming; however waiting at least 1 hour should have minimal affect on absorption if done infrequently. Alcohol-based gels are flammable; avoid fire or smoking until gel has dried. Testosterone may be transferred to another person following skin-to-skin contact with the application site. Thoroughly wash hands after application and cover application site with clothing (ie shirt) once gel has dried, or clean application site thoroughly with soap and water prior to contact in order to minimize transfer.

AndroGel® multidose pump: Prime pump 3 times (and discard this portion of product) prior to initial use.

Dietary ConsiderationsTestosterone USP may be synthesized from soy. Food and beverages have not been found to interfere with buccal system; ensure system is in place following eating, drinking, or brushing teeth.

Storage

Androderm®: Store at room temperature. Do not store outside of pouch. Excessive heat may cause system to burst.

AndroGel®, Delatestryl®, Striant®, Testim®: Store at room temperature.

Depo® Testosterone: Store at room temperature. Protect from light.

Testopel®: Store in a cool location.

RestrictionsC-III

ContraindicationsHypersensitivity to testosterone or any component of the formulation; males with carcinoma of the breast or prostate; pregnancy or women who may become pregnant; breast-feeding

Depo®-Testosterone: Also contraindicated in serious hepatic, renal, or cardiac disease

Andriol®: Also contraindicated in hepatic, renal, or cardiac disease; hypercalcemia; nephrosis or nephritic phase of nephritis; prepubertal males; patients who are easily sexually stimulated

Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Gynecomastia: May cause gynecomastia.
- Hepatic effects: Prolonged use of high doses of androgens has been associated with serious hepatic effects (peliosis hepatis, hepatic neoplasms, cholestatic hepatitis, jaundice).
- Hypercalcemia: May cause hypercalcemia in patients with prolonged immobilization or cancer.
- Hypercholesterolemia: May alter serum cholesterol; use caution with history of MI or coronary artery disease.
- Hypoglycemia: Has both androgenic and anabolic activity, the anabolic action may enhance hypoglycemia.
- Prostate cancer: May increase the risk of prostate cancer.
- Spermatogenesis: Large doses may suppress spermatogenesis.

Disease-related concerns:

- Benign prostatic hyperplasia (BPH): Urethral obstruction may develop in patients with BPH; treatment should be discontinued if this should occur (use lower dose if restarted). Withhold treatment pending urological evaluation if PSA >3 ng/mL.
- Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.
- Sleep apnea: May potentiate sleep apnea in some male patients (obesity or chronic lung disease).

Special populations:

- Elderly: Use with caution in elderly patients, they may be at greater risk for prostatic hyperplasia, prostate cancer, fluid retention, and transaminase elevations.
- Pediatrics: May accelerate bone maturation without producing compensatory gain in linear growth in children; in prepubertal children perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers. Gels and buccal system have not been evaluated in males <18 years of age; safety and efficacy of injection have not been established in males <12 years of age.

Dosage form specific issues:

- Benzyl alcohol: Some dosage forms may contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.
- Gel: Testosterone may be transferred to another person following skin-to-skin contact with the application site. Virilization of female sexual partners has been reported with male use of the topical gel.
- Soy: Some testosterone products may be chemically synthesized from soy.
- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

Geriatric ConsiderationsElderly males treated with androgens may be at increased risk of developing prostatic hyperplasia and prostatic carcinoma. Increase in libido may occur.

Pregnancy Risk FactorX

Pregnancy ConsiderationsTestosterone may cause adverse effects, including masculinization of the female fetus, if used during pregnancy. Females who are or may become pregnant should also avoid skin-to-skin contact to areas where testosterone has been applied topically on another person.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsHigh levels of endogenous maternal testosterone, such as those caused by certain ovarian cysts, suppress milk production. Maternal serum testosterone levels generally fall following pregnancy and return to normal once breast-feeding is stopped. The amount of testosterone present in breast milk or the effect to the nursing infant following maternal supplementation is not known. Some products are contraindicated while breast-feeding.

Adverse ReactionsFrequency rarely defined.

Cardiovascular: Deep venous thrombosis, edema, hypertension, vasodilation

Central nervous system: Aggressive behavior, amnesia, anxiety, dizziness, emotional lability, excitation, headache, malaise, mental depression, nervousness, seizure, sleep apnea, sleeplessness

Dermatologic: Acne, alopecia, dry skin, hair discoloration, hirsutism (increase in pubic hair growth), pruritus, rash, seborrhea

Endocrine & metabolic: Breast soreness, gonadotropin secretion decreased, growth acceleration, gynecomastia, hot flashes, hypercalcemia, hyperchloremia, hypercholesterolemia, hyper-/hypokalemia, hyperlipidemia, hypernatremia, hypoglycemia, inorganic phosphate retention, libido changes, menstrual problems (including amenorrhea), virilism, water retention

Gastrointestinal: GI bleeding, GI irritation, nausea, taste disorder, vomiting, weight gain

Following buccal administration (most common): Bitter taste, gum edema, gum or mouth irritation, gum pain, gum tenderness, taste perversion

Genitourinary: Bladder irritability, epididymitis, impotence, oligospermia, priapism, prostatic carcinoma, prostatic hyperplasia, PSA increased, testicular atrophy, urination impaired

Hepatic: Bilirubin increased, cholestatic hepatitis, cholestatic jaundice, hepatic dysfunction, hepatic necrosis, hepatocellular neoplasms, liver function test changes, peliosis hepatis

Hematologic: Anemia, bleeding, hematocrit/hemoglobin increased, leukopenia, polycythemia, suppression of clotting factors

Local: Application site reaction (gel), injection site pain

Transdermal system: Pruritus at application site (37%), burn-like blisters under system (12%), erythema at application site (7%), vesicles at application site (6%), allergic contact dermatitis to system (4%), burning at application site (3%), induration at application site (3%)

Neuromuscular & skeletal: Paresthesia, weakness

Ocular: Lacrimation increased

Renal: Creatinine increased

Respiratory: Dyspnea

Miscellaneous: Anaphylactoid reactions, diaphoresis, hypersensitivity reactions, smell disorder

Postmarketing and/or case reports: Injection: Cough, coughing fits, respiratory distress

Metabolism/Transport Effects**Substrate** (minor) of CYP2B6, 2C9, 2C19, 3A4; **Inhibits** CYP3A4 (weak)
Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease testosterone levels.
Test InteractionsMay cause a decrease in thyroid function tests
Monitoring ParametersPeriodic liver function tests, PSA and prostate exam (prior to therapy, at 3 months, then as based on current guidelines), cholesterol, hemoglobin and hematocrit (prior to therapy, at 3 months, then annually); radiologic examination of wrist and hand every 6 months (when using in prepubertal children). Withhold initial treatment with hematocrit >50%, hyperviscosity, untreated obstructive sleep apnea, or uncontrolled severe heart failure. Monitor urine and serum calcium and signs of virilization in women treated for breast cancer.

PSA: Withhold initial treatment if PSA >3 ng/mL, or with palpable prostate nodule or induration without further urological evaluation. Do not treat with severe untreated BPH with IPSS symptom score >19.

Serum testosterone: Monitor 3 months after initiating treatment, then annually.

Injection: Measure midway between injections

AndroGel®: Morning serum testosterone levels 14 days after start of therapy

Androderm®: Morning serum testosterone levels following application the previous evening

Striant®: Application area of gums; total serum testosterone 4-12 weeks after initiating treatment, prior to morning dose

Reference RangeTestosterone, urine: Male: 100-1500 ng/24 hours; Female: 100-500 ng/24 hours
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, effects of warfarin may be enhanced; may increase fluid retention with corticosteroids). Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse reactions regularly during therapy. Caution patients with diabetes, may cause hypoglycemic reaction. Teach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Instruct patients of childbearing age or males who may have intercourse with women of childbearing age on appropriate barrier contraceptive measures.
Monitoring: Lab TestsPeriodic liver function tests, PSA and prostate exam (prior to therapy, at 3 months, then as based on current guidelines), cholesterol, hemoglobin and hematocrit (prior to therapy, at 3 months, then annually). Withhold initial treatment with hematocrit >50%, hyperviscosity; monitor urine and serum calcium in women treated for breast cancer.

PSA: Withhold initial treatment if PSA >3 ng/mL, or with palpable prostate nodule or induration without further urological evaluation. Do not treat with severe untreated BPH with IPSS symptom score >19.

Serum testosterone: Monitor 3 months after initiating treatment, then annually.

Injection: Measure midway between injections

AndroGel®: Morning serum testosterone levels 14 days after start of therapy

Androderm®: Morning serum testosterone levels following application the previous evening

Striant®: Application area of gums; total serum testosterone 4-12 weeks after initiating treatment, prior to morning dose

Patient EducationUse exactly as directed according to formulation. For topical application (patch or gel) or buccal application, follow directions that accompany package. If using self-administered injections, follow prescriber's directions for injection procedure and disposal of syringes/needles. If you have diabetes, monitor serum glucose closely and notify prescriber of changes; this medication may alter hypoglycemic requirements. You may experience acne, growth of body hair, loss of libido, impotence, menstrual irregularity (usually reversible), nausea, taste disorder, or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report changes in menstrual pattern; enlarged or painful breasts; deepening of voice; unusual growth of body hair; persistent penile erection; fluid retention (swelling of ankles, feet, or hands); respiratory difficulty or sudden weight gain); unresolved changes in CNS (nervousness, chills, insomnia, depression, aggressiveness); altered urinary patterns; change in color of urine or stool; yellowing of eyes or skin; unusual bruising or bleeding; blood in urine or stool; difficulty sleeping or sleep apnea; skin irritation, redness, burning, or swelling at application site or injection site; or other persistent adverse reactions.

Transdermal: Androderm®: Apply patch to clean, dry area of skin on the arm, back, or upper buttocks.

Topical gel: AndroGel®, Testim®: Apply gel to clean, dry, intact skin of the shoulder and upper arms (AndroGel® may also be applied to the abdomen). Apply at same time each day (preferably in the morning). Upon opening the packet(s), the entire contents should be squeezed into the palm of the hand and immediately applied to the application site(s). Alternatively, a portion may be squeezed onto palm of hand and applied, repeating the process until entire packet has been applied. Gel is flammable (avoid fire or smoking until gel has dried). Application sites should be allowed to dry for a few minutes prior to dressing. Wash hands thoroughly with soap and water after application. Do not apply testosterone gel to the genitals. Testosterone may be transferred to another person with skin-to-skin contact at application site; cover application site with clothing, or wash site thoroughly with soap and water prior to contact in order to minimize transfer.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a female to become pregnant. Male/female: Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule, gelatin, as undecanoate:

- Andriol™ [CAN]: 40 mg (10s) [not available in U.S.]

Gel, topical:

- AndroGel®:
  - 1.25 g/actuation (75 g) [1% metered-dose pump; delivers 5 g/4 actuations; provides sixty 1.25 g actuations; contains ethanol 67%; may be chemically synthesized from soy]
  - 2.5 g (30s) [1% unit dose packets; contains ethanol 67%; may be chemically synthesized from soy]
  - 5 g (30s) [1% unit dose packets; contains ethanol; may be chemically synthesized from soy]
- Testim®: 5 g (30s) [1% unit-dose tube; contains ethanol 74%; may be chemically synthesized from soy]

Implant, subcutaneous:

- Testopel®: 75 mg (10s, 100s)

Injection, in oil, as cypionate: 100 mg/mL (10 mL); 200 mg/mL (1 mL, 10 mL)

- Depo®-Testosterone: 100 mg/mL (10 mL); 200 mg/mL (1 mL, 10 mL) [contains benzyl alcohol, benzyl benzoate, and cottonseed oil]

Injection, in oil, as enanthate: 200 mg/mL (5 mL)

- Delatestryl®: 200 mg/mL (1 mL, 5 mL) [contains sesame oil]

Kit [for prescription compounding; testosterone 2%]:

- First®-Testosterone:
  - Injection, in oil: Testosterone propionate 100 mg/mL (12 mL) [contains sesame oil and benzyl alcohol]
  - Ointment: White petrolatum (48 g)
- First®-Testosterone MC:
  - Injection, in oil: Testosterone propionate 100 mg/mL (12 mL) [contains sesame oil and benzyl alcohol]
  - Cream: Moisturizing cream (48 g)

Mucoadhesive, for buccal application [buccal system]:

- Striant®: 30 mg (10s) [may be chemically synthesized from soy]

Transdermal system, topical:

- Androderm®: 2.5 mg/day (60s) [contains ethanol]; 5 mg/day (30s) [contains ethanol]

Generic AvailableYes: Injection

Pricing: U.S. (www.drugstore.com)

Cream (First-Testosterone MC)

- 2% (60): $49.03

Gel (AndroGel)

- 25 mg/2.5 g (75): $230.98

Patch, 24-hour (Androderm)

2.5 mg/24 hrs (60): $225.31

5 mg/24 hrs (30): $232.04

Mechanism of ActionPrincipal endogenous androgen responsible for promoting the growth and development of the male sex organs and maintaining secondary sex characteristics in androgen-deficient males

Pharmacodynamics/Kinetics

Duration (route and ester dependent): I.M.: Cypionate and enanthate esters have longest duration, ≤2-4 weeks; gel: 24-48 hours

Absorption: Transdermal gel: ~10% of applied dose

Protein binding: 98%; bound to sex hormone-binding globulin (40%) and albumin

Metabolism: Hepatic; forms metabolites, including dihydrotestosterone (DHT) and estradiol (both active)

Half-life elimination: 10-100 minutes

Excretion: Urine (90%); feces (6%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Buccal administration: Bitter taste, gum edema, gum or mouth irritation, gum tenderness, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, insomnia, aggressive behavior, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

Index TermsTestosterone Cypionate; Testosterone Enanthate

Pharmacologic CategoryImmune Globulin
Use: Labeled IndicationsProphylaxis against tetanus following injury in patients where immunization status is not known or uncertain

The Advisory Committee on Immunization Practices (ACIP) recommends passive immunization with TIG for the following:

- Persons with a wound that is not clean or minor and in whom contraindications to a tetanus-toxoid containing vaccine exist and they have not completed a primary series of tetanus toxoid immunization.
- Persons who are wounded in bombings or similar mass casualty events who have penetrating injuries or nonintact skin exposure and who cannot confirm receipt of a tetanus booster within the previous 5 years. In case of shortage, use should be reserved for persons ≥60 years of age.

Dosing: Adults

Prophylaxis of tetanus: I.M.: 250 units

Treatment of tetanus: I.M.: 500-6000 units. Infiltration of part of the dose around the wound is recommended.

Tetanus Prophylaxis in Wound Management

Number of Prior Tetanus Toxoid Doses	**Clean, Minor Wounds**		**All Other Wounds**	
	Td[1]	**TIG**[2]	**Td**[1]	**TIG**[2]
Unknown or <3	Yes	No	Yes	Yes
≥3[3]	No[4]	No	No[5]	No
[1]Adult tetanus and diphtheria toxoids; use pediatric preparations (DT or DTP) if the patient is <7 years old.				
[2]Tetanus immune globulin.				
[3]If only three doses of fluid tetanus toxoid have been received, a fourth dose of toxoid, preferably an adsorbed toxoid, should be given.				
[4]Yes, if >10 years since last dose.				
[5]Yes, if >5 years since last dose.				
Adapted from Centers for Disease Control, “Diphtheria, Tetanus, and Pertussis: Recommendations for Vaccine Use and Other Preventive Measures: Recommendations of the Immunization Practices Advisory Committee (ACIP),” *MMWR* 1991:40(RR-10).				

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Prophylaxis of tetanus: I.M.:

Children <7 years: 4 units/kg; some recommend administering 250 units to small children

Children ≥7 years: Refer to adult dosing.

Treatment of tetanus: Refer to adult dosing.

Administration: I.M.Do not administer I.V.; I.M. use only. Administer in the anterolateral aspects of the upper thigh or the deltoid muscle of the upper arm. Avoid gluteal region due to risk of injury to sciatic nerve; if gluteal region is used, administer only in the upper outer quadrant. If tetanus vaccine and tetanus immune globulin are administered simultaneously, separate sites should be used for each injection. When used for the treatment of tetanus, infiltration of part of the dose around the wound is recommended.

Vaccine administration with antibody-containing products*:

Antibody-containing products and inactivated vaccines: May be given simultaneously at different sites or at any interval between doses.

Antibody-containing products and live vaccines: Do not give simultaneously.

*Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore at 2°C to 8°C (26°F to 46°F). Do not use if frozen.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Use with caution in patients with isolated immunoglobulin A deficiency or a history of systemic hypersensitivity to human immunoglobulins.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with thrombocytopenia or coagulation disorders; I.M. injections may be contraindicated.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Administration: Not for intravenous administration.

- Skin testing: Skin testing should not be performed as local irritation can occur and be misinterpreted as a positive reaction.

Geriatric ConsiderationsTetanus is a rare disease in U.S. with <100 cases annually; 66% of cases occur in persons >50 years of age; protective tetanus and diphtheria antibodies decline with age; it is estimated that <50% of the elderly are protected.

Elderly are at risk because:

Many lack proper immunization maintenance

Higher case fatality ratio

Immunizations are not available from childhood

Indications for vaccination:

Primary series with combined tetanus-diphtheria (Td) should be given to all elderly lacking a clear history of vaccination

Boosters should be given at 10-year intervals; earlier for wounds

Elderly are more likely to require tetanus immune globulin with infection of tetanus due to lower antibody titer.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Tetanus immune globulin and a tetanus toxoid containing vaccine are recommended by the ACIP as part of the standard wound management to prevent tetanus in pregnant women.

Adverse ReactionsFrequency not defined.

Central nervous system: Temperature increased

Dermatologic: Angioneurotic edema (rare)

Local: Injection site: pain, soreness, tenderness

Renal: Nephritic syndrome (rare)

Miscellaneous: Anaphylactic shock (rare)

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

HyperTET™ S/D: 250 units/mL (1 mL) [prefilled syringe]

Generic AvailableNo
ManufacturerTalecris Biotherapeutics, Inc
Mechanism of ActionPassive immunity toward tetanus
Pharmacodynamics/KineticsAbsorption: Well absorbed
Related Information

- [Immunization Recommendations]

Pharmacotherapy PearlsTetanus immune globulin (TIG) must not contain <50 units/mL. Protein makes up 10% to 18% of TIG preparations. The great majority of this (≥90%) is IgG. TIG has almost no color or odor and it is a sterile, nonpyrogenic, concentrated preparation of immunoglobulins that has been derived from the plasma of adults hyperimmunized with tetanus toxoid. The pooled material from which the immunoglobulin is derived may be from fewer than 1000 donors. This plasma has been shown to be free of hepatitis B surface antigen.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Tetanus Toxoid (Adsorbed)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tetanus toxoid products may be confused with influenza virus vaccine and tuberculin products. Medication errors have occurred when tetanus toxoid products have been inadvertently administered instead of tuberculin skin tests (PPD) and influenza virus vaccine. These products are refrigerated and often stored in close proximity to each other.

Pronunciation(TET a nus TOKS oyd, ad SORBED)

Pharmacologic CategoryVaccine, Inactivated (Bacterial)

Use: Labeled IndicationsActive immunization against tetanus when combination antigen preparations are not indicated. **Note:** Tetanus and diphtheria toxoids for adult use (Td) is the preferred immunizing agent for most adults and for children after their seventh birthday. Young children should receive trivalent DTaP (diphtheria/tetanus/acellular pertussis), as part of their childhood immunization program, unless pertussis is contraindicated, then DT is warranted.

Dosing: Adults

Primary immunization: I.M.: 0.5 mL; repeat 0.5 mL at 4-8 weeks after first dose and at 6-12 months after second dose

Routine booster dose: Recommended every 10 years

Note: In most patients, Td is the recommended product for primary immunization, booster doses, and tetanus immunization in wound management.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥7 years: Refer to adult dosing.

Administration: I.M.Inject intramuscularly in the area of the vastus lateralis (midthigh laterally) or deltoid. Do not inject into gluteal area. Shake well prior to withdrawing dose; do not use if product does not form a suspension.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Tetanus toxoid vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Tetanus toxoid vaccine with live vaccines: May be given simultaneously or at any interval between doses

Vaccine administration with antibody-containing products: Tetanus toxoid vaccine may be be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore at 2°C to 8°C (26°F to 46°F); do not freeze.

ContraindicationsHypersensitivity to tetanus toxoid or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during use.
- Arthus-type hypersensitivity: Tetanus containing vaccines and emergency doses of tetanus vaccine should not be given more frequently than every 10 years in patients who have experienced a serious Arthus-type hypersensitivity reaction following a prior use of tetanus toxoid.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Guillain-Barré syndrome: Use with caution if Guillain-Barré syndrome occurred within 6 weeks of prior tetanus toxoid.

- Poliomyelitis: Defer elective immunization during outbreaks of poliomyelitis.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Immunocompromised patients: Patients who are immunocompromised may have reduced response; may be used in patients with HIV infection.

- Pediatrics: Safety and efficacy have not been established in children <7 years of age.

Dosage form specific issues:

- Latex: Vial stopper may contain natural latex rubber.

- Thimerosal: Product may contain thimerosal.

Other warnings/precautions:

- Administration: Avoid injection into a blood vessel.

Geriatric ConsiderationsTetanus is a rare disease in U.S. with <100 cases annually; 66% of cases occur in persons >50 years of age; protective tetanus and diphtheria antibodies decline with age; it is estimated that <50% of elderly are protected.

Elderly are at risk because:

Many lack proper immunization maintenance

Higher case fatality ratio

Immunizations are not available from childhood

Indications for vaccination:

Primary series with combined tetanus-diphtheria (Td) should be given to all elderly lacking a clean history of vaccination

Boosters should be given at 10-year intervals; earlier for wounds

Elderly are more likely to require tetanus immune globulin with infection of tetanus due to lower antibody titer.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. The ACIP recommends vaccination in previously unvaccinated women or in women with an incomplete vaccination series, whose child may be born in unhygienic conditions. Tetanus immune globulin and a tetanus toxoid-containing vaccine are recommended by the ACIP as part of the standard wound management to prevent tetanus in pregnant women. Vaccination using Td is preferred.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions **All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined.

Cardiovascular: Hypotension

Central nervous system: Brachial neuritis, fever, malaise, pain

Gastrointestinal: Nausea

Local: Edema, induration (with or without tenderness), rash, redness, urticaria, warmth

Neuromuscular: Arthralgia, Guillain-Barré syndrome

Miscellaneous: Anaphylactic reaction, Arthus-type hypersensitivity reaction

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension: Tetanus 5 Lf units per 0.5 mL (0.5 mL) [contains trace amounts of thimerosal]

Generic AvailableNo

ManufacturerSanofi Pasteur Inc

Mechanism of ActionTetanus toxoid preparations contain the toxin produced by virulent tetanus bacilli (detoxified growth products of *Clostridium tetani*). The toxin has been modified by treatment with formaldehyde so that it has lost toxicity but still retains ability to act as antigen and produce active immunity; the aluminum salt, a mineral adjuvant, delays the rate of absorption and prolongs and enhances its properties; duration ~10 years.

Pharmacodynamics/KineticsDuration: Primary immunization: ~10 years

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

> Tetanus toxoid products may be confused with influenza virus vaccine and tuberculin products. Medication errors have occurred when tetanus toxoid products have been inadvertently administered instead of tuberculin skin tests (PPD) and influenza virus vaccine. These products are refrigerated and often stored in close proximity to each other.

Pronunciation(TET a nus TOKS oyd FLOO id)

Pharmacologic CategoryToxoid

Use: Labeled IndicationsIndicated as booster dose in the active immunization against tetanus in the rare adult or child who is allergic to the aluminum adjuvant (a product containing adsorbed tetanus toxoid is preferred); not indicated for primary immunization

Use: Unlabeled/InvestigationalAnergy testing (no longer recommended)

Dosing: Adults

Primary immunization: Not indicated for this use.

Booster doses: I.M., SubQ: 0.5 mL every 10 years

Anergy testing (unlabeled use; no longer recommended for this indication): Intradermal: 0.1 mL; doses that have been used range from 0.1 mL of a 1:10 dilution to 0.1 mL of the undiluted product

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.M.Shake well prior to use. Administer I.M. in lateral aspect of midthigh or deltoid muscle of upper arm

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration: OtherSubQ: Shake well prior to use. Administer in area of the lateral aspect of midthigh or deltoid. SubQ route may be preferred in patients with thrombocytopenia or coagulation disorders.

StorageRefrigerate 2°C to 8°C (35°F to 46°F); do not freeze.

ContraindicationsHypersensitivity to tetanus toxoid or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during use. In patients with a history of severe local reaction (Arthus-type) or temperature of >39.4˚C (>103˚F) following previous dose, do not give further routine or emergency doses of tetanus and diphtheria toxoids for 10 years.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration. SubQ administration may be preferred.

- Poliomyelitis: Defer elective immunization during outbreaks of poliomyelitis.

Special populations:

- Immunocompromised patients: Patients who are immunocompromised may have reduced response; may be used in patients with HIV infection.

- Pediatrics: Safety and efficacy have not been established in children <6 weeks of age; this product is not indicated for use in children <7 years of age.

Dosage form specific issues:

- Latex: Vial stopper may contain natural latex rubber.

- Thimerosal: Product may contain thimerosal.

Geriatric ConsiderationsTetanus is a rare disease in U.S. with <100 cases annually; 66% of cases occur in persons >50 years of age; protective tetanus and diphtheria antibodies decline with age; it is estimated that <50% of elderly are protected.

Elderly are at risk because:

- Many lack proper immunization maintenance
- Higher case fatality ratio
- Immunizations are not available from childhood

Indications for vaccination:

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tet ra BEN a zeen)

U.S. Brand NamesXenazine®

Canadian Brand NamesNitoman™

Pharmacologic CategoryCentral Monoamine-Depleting Agent

Use: Labeled IndicationsTreatment of chorea associated with Huntington’s disease

Canadian labeling: Treatment of hyperkinetic movement disorders, including Huntington's chorea, hemiballismus, senile chorea, Tourette syndrome, and tardive dyskinesia

Dosing: AdultsDose should be individualized; titrate slowly

Chorea associated with Huntington’s disease: Oral:

Initial: 12.5 mg once daily, may increase to 12.5 mg twice daily after 1 week

Maintenance: May be increased by 12.5 mg/day at weekly intervals; doses >37.5 mg/day should be divided into 3 doses (maximum single dose 25 mg)

Patients requiring doses >50 mg/day: Genotype for CYP2D6:

Extensive/intermediate metabolizers: Maximum: 100 mg/day; 37.5 mg/dose

Poor metabolizers: Maximum: 50 mg/day; 25 mg/dose

Concomitant use with strong CYP2D6 inhibitors (eg, fluoxetine, paroxetine, quinidine): Dose of tetrabenazine should be reduced by 50% in patients receiving strong CYP2D6 inhibitors, follow dosing for poor CYP2D6 metabolizers. Use caution when adding a CYP2D6 inhibitor to patients already taking tetrabenazine.

Note: If treatment is interrupted for >5 days, retitration is recommended. If treatment is interrupted for <5 days resume at previous maintenance dose.

Canadian labeling: Hyperkinetic movement disorders: Initial: 12.5 mg twice daily (may be given 3 times/day); may be increased by 12.5 mg/day every 3-5 days; should be titrated slowly to maximal tolerated and effective dose (dose is individualized)

Usual maximum tolerated dosage: 25 mg 3 times/day; maximum recommended dose: 200 mg/day

Note: If there is no improvement at the maximum tolerated dose after 7 days, improvement is unlikely; discontinuation should be considered.

Dosing: ElderlyCanadian labeling: Elderly and/or debilitated patients: Consider initiation at lower doses; must be titrated slowly to individualize dosage.

Dosing: Hepatic ImpairmentUse is contraindicated.

Dosing: Adjustment for ToxicityFor toxicity/adverse reaction, including akathisia, restlessness, parkinsonism, insomnia, depression, suicidality, anxiety, sedation (intolerable): Suspend upward dosage titration and reduce dose; consider discontinuing if adverse reaction does not resolve (may be discontinued without tapering.

Administration: OralMay administer with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider.

Contraindications

U.S. labeling: Patients who are actively suicidal or with untreated or inadequately treated depression; hepatic impairment; use with or within 14 days of MAO inhibitors; use with or within 20 days of reserpine

Canadian labeling: Hypersensitivity to tetrabenazine or any component of the formulation; history or current episode of clinical depression; use with or within 14 days of MAO inhibitors

Warnings/Precautions

Box warnings:

- Depression/suicidal ideation: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Akathisia: Use has been associated with akathisia; monitor for signs and symptoms of restlessness and agitation. Dosage reduction or discontinuation may be necessary.

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Depression/suicidal ideation: [**U.S. Boxed Warning]: May increase risk for depression and suicidal ideation; evaluate immediately if signs and/or symptoms of depression or suicidality are noted. Use with caution in patients with a history of depression; monitor patients closely for new or worsening signs or symptoms of depression.** Reduce dose if depression occurs; consider discontinuing if depression/suicidal ideation does not resolve.

- Esophageal dysmotility/aspiration: Use has been associated with esophageal dysmotility, dysphagia, and aspiration; use with caution in patients at risk of aspiration pneumonia.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity and/or autonomic instability. Discontinue with confirmed NMS; may reoccur with reintroduction of treatment; monitor carefully.

- Orthostatic hypotension: May cause orthostatic hypotension; monitor patients at risk closely.

- QT prolongation: Has been shown to prolong the QT interval alone (minimal) and with other drugs with comparable effects on the QT interval (additive). Avoid use in patients with congenital QT prolongation, a history of cardiac arrhythmias, or concomitant drugs known to cause QT prolongation.

Disease-related concerns:

- Parkinson's disease: Use with caution in patients with Parkinson's disease; may induce/exacerbate symptoms of parkinsonism (more common in elderly patients). Dose reduction or discontinuation of therapy may be necessary.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Psychiatric disease: Due to the possibility of comorbid psychiatric disorders and potential psychiatric adverse effects, patients should be carefully monitored for potential changes in psychiatric status during therapy.

Concurrent drug therapy issues:

- Neuroleptic drugs: Has not been studied with concomitant use of neuroleptic drugs (eg, haloperidol, olanzapine); adverse effects may be additive.

Special populations:

- CYP2D6 poor metabolizers: Patients should be tested for the CYP2D6 gene prior to initiating doses >50 mg/day; maximum dosage should not exceed 50 mg/day in poor metabolizers.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Should not be used to treat levodopa-induced dyskinesia.

Geriatric ConsiderationsNo specific geriatric information is available.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAdverse events were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women. Avoid use in pregnant women unless the potential benefit justifies the potential risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions**Note:** Many adverse effects are dose-related and may resolve at lower dosages. Adverse effects reported for adults with chorea associated with Huntington’s disease.

>10%:

Central nervous system: Extrapyramidal symptoms (15% to 33%), sedation (31%), somnolence (31%), fatigue (22%), insomnia (22%), akathisia (19%), depression (19%), anxiety (15%)

Gastrointestinal: Nausea (13%)

Neuromuscular & skeletal: Falls (15%)

Respiratory: Upper respiratory tract infection (11%)

1% to 10%:

Central nervous system: Parkinsonism (3% to 10%), irritability (9%), dizziness (4%), headache (4%), obsessive reaction (4%)

Dermatologic: Bruising (6%)

Gastrointestinal: Dysphagia (4% to 10%), vomiting (6%), appetite decreased (4%), diarrhea (2%)

Genitourinary: Dysuria (4%)

Neuromuscular & skeletal: Balance difficulty (9%), bradykinesia (9%), dysarthria (4%), gait disturbance (4%)

Respiratory: Bronchitis (4%), dyspnea (4%)

<1%, postmarketing, and/or case reports: Aspiration pneumonia, hyperprolactinemia, orthostatic hypotension, neuroleptic malignant syndrome, QT_c prolongation, restlessness, suicidal ideation, suicide, syncope, transaminases increased

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antipsychotics: Tetrabenazine may enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

MAO Inhibitors: Tetrabenazine may enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Reserpine: May enhance the adverse/toxic effect of Tetrabenazine. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersImprovement in movement disorder; signs and/or symptoms of depression or suicidal ideation; signs and/or symptoms of NMS; orthostatic blood pressure. Due to the possibility of comorbid psychiatric disorders, and potential psychiatric adverse effects, patients should be carefully monitored for potential changes in psychiatric status during therapy. CYP2D6 genotyping for evaluation of metabolizer status.

Nursing: Physical Assessment/MonitoringEvaluate closely for presence or history of depression or other psychiatric disorders, hepatic impairment, cardiac abnormalities, or recent use of MAO inhibitors. Assess all other pharmacological or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. Dosing should be individualized and titrated slowly. Evaluate therapeutic effectiveness (according to purpose for use) and adverse effects (especially psychiatric status or CNS changes) at beginning of therapy, with any dose change, and at frequent intervals during long-term therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. Take exactly as directed; do not alter dose or schedule without consulting prescriber. May cause dizziness, headache, or sedation (use caution when driving or engaging in tasks requiring alertness until response to drug is known) or nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report immediately any signs of CNS changes (mood changes, increased irritability or anxiety, cognition changes, depression, suicidal ideation, difficulty thinking or abnormal thoughts); neuromuscular changes (rigidity, unusual movement, gait disturbance, balance difficulty); difficulty swallowing; difficulty breathing or upper respiratory infection; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian product

Tablet:

Nitoman™ [CAN]: 25 mg [not available in the U.S.]

Xenazine®: 12.5 mg, 25 mg

ManufacturerPrestwick Pharmaceuticals, Inc

Mechanism of ActionWithin basal ganglia, interferes with and depletes monoamine neurotransmitters (including dopamine, serotonin, and norepinephrine) in presynaptic vesicles (likely through actions on vesicle monoamine transporter). Tetrabenazine inhibits presynaptic dopamine release and also blocks CNS dopamine receptors. The effects resemble reserpine but with less peripheral activity and a shorter duration of action. Treatment results in symptomatic improvement of hyperkinetic movement disorders, including Huntington's chorea, hemiballismus, senile chorea, Tic and Hille's de la Tourette syndrome, and tardive dyskinesia.

Pharmacodynamics/Kinetics

Duration: 16-24 hours (at steady-state); chorea may recur within 12-18 hours after discontinuation

Protein binding: 82% to 85%; Metabolites: 59% to 68%

Metabolism: Hepatic (rapid and extensive), to alpha and beta hydroxytetrabenazine (HTBZ) via CYP2D6 (primary active moiety)

Bioavailability: Low and erratic (due to extensive first-pass effects); unaffected by food

Half-life elimination: Alpha-HTBZ: 4-8 hours; Beta-HTBZ: 2-4 hours (increased with hepatic impairment)

Time to peak, plasma: Within 1-1.5 hours

Excretion: Urine (75% as metabolites, <10% as alpha and beta HTBZ); feces (7% to 16%)

Dental Health: Effects on Dental Treatment

Key adverse event(s) related to dental treatment: Orthostatic hypotension has been reported; monitor patient during erect posture from dental chair and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

No information available to require special precautions

Jump To Field (Select Field Name)

Pronunciation(TET ra kane)

U.S. Brand NamesPontocaine®; Pontocaine® Niphanoid®

Canadian Brand NamesAmetop™; Pontocaine®

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsSpinal anesthesia; local anesthesia in the eye for various diagnostic and examination purposes; topically applied to nose and throat for various diagnostic procedures

Use: DentalEster-type local anesthetic; applied topically to throat for various diagnostic procedures and on cold sores and fever blisters for pain

Dosing: Adults

Short-term anesthesia of the eye: Ophthalmic 0.5% solution: Instill 1-2 drops; prolonged use (especially for at-home self-medication) is not recommended

Spinal anesthesia: Injection: **Note:** Dosage varies with the anesthetic procedure, the degree of anesthesia required, and the individual patient response; it is administered by subarachnoid injection for spinal anesthesia.

Perineal anesthesia: 5 mg

Perineal and lower extremities: 10 mg

Anesthesia extending up to costal margin: 15 mg; doses up to 20 mg may be given, but are reserved for exceptional cases

Low spinal anesthesia (saddle block): 2-5 mg

Topical mucous membranes (rhinolaryngology): Used as a 0.25% or 0.5% solution by direct application or nebulization; total dose should not exceed 20 mg

Dosing: ElderlyRefer to adult dosing.

Storage

Injection: Store solution under refrigeration. Protect from light.

Ophthalmic and topical solutions: Store under refrigeration at 2°C to 8°C.

Reconstitution

Solution for injection: Hyperbaric solution: May be made by mixing equal volumes of the 1% solution and $D_{10}W$.

Powder for injection:

Hyperbaric solution: Dissolve 10 mg of Pontocaine® Niphanoid® in 1 mL $D_{10}W$. Further dilute with equal volume of spinal fluid. Resulting solution is D_5W with tetracaine 5 mg/mL.

Hypobaric solution: Dissolve 1 mg of Pontocaine® Niphanoid® in 1 mL SWFI.

ContraindicationsHypersensitivity to tetracaine, ester-type anesthetics, aminobenzoic acid, or any component of the formulation; injection should not be used when spinal anesthesia is contraindicated

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Decreased plasma esterase levels: Use with caution in patients with abnormal or decreased levels of plasma esterases.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.

Special populations:

- Acutely ill patients: Use with caution in acutely ill patients; dose reduction may be required.
- Debilitated patients: Use with caution in debilitated patients; dose reduction may be required.
- Elderly: Use with caution in the elderly; dose reduction may be required.
- Obstetric patients: Use with caution in obstetric patients; dose reduction may be required.
- Patients with increased intra-abdominal pressure: Use with caution in patients with increased intra-abdominal pressure; dose reduction may be required.

Dosage form specific issues:

- Ophthalmic: May delay wound healing. Prolonged use is not recommended. The anesthetized eye should be protected from irritation, foreign bodies, and rubbing to prevent inadvertent damage.

- Sodium bisulfite: Products may contain sodium bisulfite which may cause allergic reactions in some individuals.

- Trained personnel: Dental practitioners and/or clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Injection: Note: Adverse effects listed are those characteristics of local anesthetics.

Cardiovascular: Cardiac arrest, hypotension

Central nervous system: Chills, convulsions, dizziness, drowsiness, nervousness, unconsciousness

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Tremors

Ocular: Blurred vision, pupil constriction

Otic: Tinnitus

Respiratory: Respiratory arrest

Miscellaneous: Allergic reaction

Ophthalmic: Ocular: Chemosis, lacrimation, photophobia, transient stinging

With chronic use: Corneal erosions, corneal healing retardation, corneal opacification (permanent), corneal scarring, keratitis (severe)

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/Monitoring**Note:** Tetracaine is 10 times as potent as procaine. Explain use, monitor vital signs, and monitor patient safety before, during, and following use according to formulation used and procedure being done. Caution patient that anesthetic effects of topical or ophthalmic preparation may last for some time after procedure (1-5 hours). Instruct in appropriate safety precautions.
Patient EducationTopical or ophthalmic anesthesia effects may last for some time following use; you will need to observe appropriate safety precautions to prevent injury. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Ophthalmic: Do not rub or touch your eye, scratch your nose, or attempt to apply eye make-up until all sensation returns. May cause temporary rash or stinging when used. Report any ringing in ears, feeling of weakness or faintness, chest pain or palpitation, or increased restlessness.

Topical: Do not eat or drink anything until full sensation returns to lips, mouth, and throat. Use caution with heat or cold; you will not have accurate hot or cold sensation until full effects of anesthesia have worn off.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride [preservative free]:

Pontocaine® Niphanoid®: 20 mg

Injection, solution, as hydrochloride [preservative free]: 1% [10 mg/mL] (2 mL)

Pontocaine®): 1% [10 mg/mL] (2 mL) [contains sodium bisulfite]

Solution, ophthalmic, as hydrochloride: 0.5% [5 mg/mL] (2 mL, 15 mL)

Solution, topical, as hydrochloride (Pontocaine®): 2% [20 mg/mL] (30 mL, 118 mL) [for rhinolaryngology]

Generic AvailableYes: Ophthalmic solution, solution for injection
Pricing: U.S. (www.drugstore.com)

Solution (Tetracaine HCl)

0.5% (15): $8.99

Mechanism of ActionEster local anesthetic blocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction
Pharmacodynamics/Kinetics
Onset of action: Anesthetic: Rhinolaryngology: 5-10 minutes

Duration: Rhinolaryngology: ~30 minutes

Metabolism: Hepatic; detoxified by plasma esterases to aminobenzoic acid

Excretion: Urine

Pharmacotherapy PearlsApproximately 10 times more potent than procaine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or nervousness

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsTetracaine is ~10 times more potent than procaine.

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org. The protocol from the website is: **20% Fat Emulsion:** 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Index TermsAmethocaine Hydrochloride; Tetracaine Hydrochloride

Tetracycline Periodontal Fibers

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(tet ra SYE kleen per ee oh DON tal FYE bers)

U.S. Brand NamesActisite®

Pharmacologic CategoryAntibacterial, Dental

Use: Labeled IndicationsUsed exclusively in dental applications

Use: DentalTreatment of adult periodontitis; as an adjunct to scaling and root planing for the reduction of pocket depth and bleeding on probing in selected patients with adult periodontitis

Dosing: Adults

Periodontitis: Pocket insertion: Insert fiber to fill the periodontal pocket; each fiber contains 12.7 mg of tetracycline in 23 cm (9 inches) and provides continuous release of drug for 10 days; fibers are to be secured in pocket with cyanoacrylate adhesive and left in place for 10 days

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to tetracyclines or any component of the formulation

Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Oral candidiasis: Safety and efficacy have not been established in the treatment of periodontitis in patients with oral candidiasis.

Special populations:

- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.

Other warnings/precautions:

- Appropriate use: Fibers must be removed after 10 days. Pack fibers to allow for appropriate drainage. Do not use with acute periodontal abscess; not studied with chronic abscesses.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse Reactions1% to 10%:

Dermatologic: Local erythema following removal

Miscellaneous: Discomfort from fiber placement

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Fibers: 23 cm (9”) in length [12.7 mg of tetracycline hydrochloride per fiber]

Generic AvailableNo

Mechanism of ActionTetracycline is an antibiotic which inhibits growth of susceptible microorganisms. Tetracycline binds primarily to the 30S subunits of bacterial ribosomes, and appears to prevent access of aminoacyl tRNA to the acceptor site on the mRNA-ribosome complex. The fiber releases tetracycline into the periodontal site at a rate of 2 mcg/cm/hour.

Pharmacodynamics/Kinetics

The fiber releases tetracycline at a rate of 2 mcg/cm/hour

Tissue fluid concentrations:

Gingival fluid: ~1590 mcg/mL of tetracycline per site over 10 days

Plasma: During fiber treatment of up to 11 teeth, the tetracycline plasma concentration was below any detectable levels (<0.1 mcg/mL)

Oral: 500 mg of tetracycline produces a peak plasma level of 3-4 mcg/mL

Saliva: ~50.7 mcg/mL of tetracycline immediately after fiber treatment of 9 teeth

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Gingival inflammation, mouth pain, glossitis, candidiasis, staining of tongue, local erythema following removal, and discomfort from fiber placement.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Tetracycline

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tetracycline may be confused with tetradecyl sulfate

Achromycin may be confused with actinomycin, Adriamycin PFS®

Pronunciation(tet ra SYE kleen)

Canadian Brand NamesApo-Tetra®; Nu-Tetra

Pharmacologic CategoryAntibiotic, Tetracycline Derivative

Use: Labeled IndicationsTreatment of susceptible bacterial infections of both gram-positive and gram-negative organisms; also infections due to *Mycoplasma*, *Chlamydia*, and *Rickettsia*; indicated for acne, exacerbations of chronic bronchitis, and treatment of gonorrhea and syphilis in patients who are allergic to penicillin; as part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence

Use: DentalTreatment of periodontitis associated with presence of *Actinobacillus actinomycetemcomitans* (AA); as adjunctive therapy in recurrent aphthous ulcers

Dosing: Adults

Usual dosage range: Oral: 250-500 mg every 6 hours

Acne: Oral: 250-500 twice daily

Chronic bronchitis, acute exacerbation: Oral: 500 mg 4 times/day

Erlichiosis: Oral: 500 mg 4 times/day for 7-14 days

Peptic ulcer disease: Eradication of *Helicobacter pylori*: Oral: 500 mg 2-4 times/day depending on regimen; requires combination therapy with at least one other antibiotic and an acid-suppressing agent (proton pump inhibitor or H_2 blocker)

Periodontitis: Oral: 250 mg every 6 hours until improvement (usually 10 days)

Vibrio cholerae: Oral: 500 mg 4 times/day for 3 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Usual dosage range:** Children >8 years: Oral: 25-50 mg/kg/day in divided doses every 6 hours

Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer every 8-12 hours.

Cl_{cr} 10-50 mL/minute: Administer every 12-24 hours.

Cl_{cr} <10 mL/minute: Administer every 24 hours.

Slightly dialyzable (5% to 20%) via hemo- and peritoneal dialysis or via continuous arteriovenous or venovenous hemofiltration; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentUse caution; no dosing adjustment required

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralOral should be given on an empty stomach (ie, 1 hour prior to, or 2 hours after meals) to increase total absorption. Administer at least 1-2 hours prior to, or 4 hours after antacid because aluminum and magnesium cations may chelate with tetracycline and reduce its total absorption. Administer around-the-clock to promote less variation in peak and trough serum levels.

StorageOutdated tetracyclines have caused a Fanconi-like syndrome (nausea, vomiting, acidosis, proteinuria, glycosuria, aminoaciduria, polydipsia, polyuria, hypokalemia). Protect oral dosage forms from light.

ContraindicationsHypersensitivity to tetracycline or any component of the formulation; do not administer to children ≤8 years of age; pregnancy

Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Increased BUN: May be associated with increases in BUN secondary to antianabolic effects; use caution in patients with renal impairment.

- Nephropathy: Outdated drug can cause nephropathy.

- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.

- Pseudotumor cerebri: Has been (rarely) reported with tetracycline use; usually resolves with discontinuation.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Hepatotoxicity has been reported rarely; risk may be increased in patients with pre-existing hepatic or renal impairment.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: May cause tissue hyperpigmentation, enamel hypoplasia, or permanent tooth discoloration; use of tetracyclines should be avoided during tooth development (children ≤8 years of age) unless other drugs are not likely to be effective or are contraindicated. However, recommended in treatment of anthrax exposure.

- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.

Geriatric ConsiderationsThe role of tetracycline has decreased because of the emergence of resistant organisms. Doxycycline is the tetracycline of choice when one is indicated because of its better GI absorption, less interactions with divalent cations, longer half-life, and the fact that the majority is cleared by nonrenal mechanisms.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTetracyclines cross the placenta, enter fetal circulation, and may cause permanent discoloration of teeth if used during the second or third trimester. Maternal hepatic toxicity has been associated with the use of tetracycline during pregnancy, especially in patients with azotemia or pyelonephritis. Because use during pregnancy may cause fetal harm, tetracycline is classified as pregnancy category D.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsTetracyclines are excreted in breast milk. Tetracycline binds to calcium. The calcium in the maternal milk will decrease the amount of tetracycline absorbed by the breast-feeding infant. Because of this “negligible absorption by the neonate,” the AAP considers tetracycline to be “usually compatible with breast-feeding.” Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Tetracycline in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Pericarditis

Central nervous system: Intracranial pressure increased, bulging fontanels in infants, pseudotumor cerebri, paresthesia

Dermatologic: Photosensitivity, pruritus, pigmentation of nails, exfoliative dermatitis

Endocrine & metabolic: Diabetes insipidus syndrome

Gastrointestinal: Discoloration of teeth and enamel hypoplasia (young children), nausea, diarrhea, vomiting, esophagitis, anorexia, abdominal cramps, antibiotic-associated pseudomembranous colitis, staphylococcal enterocolitis, pancreatitis

Hematologic: Thrombophlebitis

Hepatic: Hepatotoxicity

Renal: Acute renal failure, azotemia, renal damage

Miscellaneous: Superinfection, anaphylaxis, hypersensitivity reactions, candidal superinfection

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (moderate)

Drug Interactions

Antacids: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Atovaquone: Tetracycline may decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth Subsalicylate: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Tetracycline Derivatives may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Penicillins: Tetracycline Derivatives may diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: Tetracycline Derivatives may enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Tetracycline Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern when both products are administered orally. **Exceptions:** Zinc Chloride. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Tetracycline serum concentrations may be decreased if taken with dairy products.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization)

Test InteractionsFalse-negative urine glucose with Clinistix®

Monitoring ParametersRenal, hepatic, and hematologic function test, temperature, WBC, cultures and sensitivity, appetite, mental status

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to beginning therapy. Assess potential interactions with other pharmacological agents and herbal products patient may be using (eg, may decrease levels/effects of penicillins and CYP3A4 inducers, increase levels/effects of warfarin and CYP3A4 substrates). Assess results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse reactions (eg, nausea, diarrhea, pericarditis, photosensitivity, rash, opportunistic infection, hypersensitivity) at beginning of and periodically throughout therapy. Caution patients with diabetes to monitor glucose levels closely (may cause false-positive urine glucose with Clinitest®). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsRenal, hepatic, and hematologic function; WBC. Perform culture and sensitivity studies prior to initiating therapy to determine the causative organism and its susceptibility to tetracycline.

Patient EducationDo not use more or more often than recommended. Preferable to take on an empty stomach, 1 hour before or 2 hours after meals. Take at regularly scheduled times, around-the-clock. Avoid antacids, iron, or dairy products within 2 hours of taking tetracycline. You may experience photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); dizziness or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea/vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report rash or intense itching, yellowing of skin or eyes, fever or chills, blackened stool, vaginal itching or discharge, foul-smelling stools, excessive thirst or urination, acute headache, unresolved or persistent diarrhea, respiratory difficulty, condition does not improve, or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Use appropriate barrier contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 250 mg, 500 mg

Generic AvailableYes: Capsule

Pricing: U.S. (www.drugstore.com)

Capsules (Tetracycline HCl)

250 mg (100): $14.99

500 mg (100): $19.99

Mechanism of ActionInhibits bacterial protein synthesis by binding with the 30S and possibly the 50S ribosomal subunit(s) of susceptible bacteria; may also cause alterations in the cytoplasmic membrane

Pharmacodynamics/Kinetics

Absorption: Oral: 75%

Distribution: Small amount appears in bile

Relative diffusion from blood into CSF: Good only with inflammation (exceeds usual MICs)

CSF:blood level ratio: Inflamed meninges: 25%

Protein binding: ~65%

Half-life elimination: Normal renal function: 8-11 hours; End-stage renal disease: 57-108 hours

Time to peak, serum: Oral: 2-4 hours

Excretion: Urine (60% as unchanged drug); feces (as active form)

Related Information

- Antimicrobial Drugs of Choice
- Malaria Treatment

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Esophagitis, superinfections, and candidal superinfection. Opportunistic “superinfection” with *Candida albicans*; tetracyclines are not recommended for use during pregnancy or in children ≤8 years of age since they have been reported to cause enamel hypoplasia and permanent teeth discoloration. The use of tetracyclines should only be used in these patients if other agents are contraindicated or alternative antimicrobials will not eradicate the organism. Long-term use associated with oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentTetracycline may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity although the clinical significance is likely minimal; monitor serum lithium levels

Index TermsAchromycin; TCN; Tetracycline Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation

(TET ra hye droe can NAB e nol & can nab e DYE ol)

Canadian Brand NamesSativex®

Pharmacologic CategoryAnalgesic, Miscellaneous

Use: Labeled IndicationsAdjunctive treatment of neuropathic pain in multiple sclerosis; adjunctive treatment of moderate-to-severe pain in advanced cancer

Dosing: Adults**Neuropathic pain (MS), cancer pain:** Buccal spray: Initial: One spray every 4 hours to a maximum of 4 sprays on first day

Titration and individualization: Dosage is self-titrated by the patient. In the treatment of MS, the mean daily dosage after titration in clinical trials was 5 sprays per day. The usual maximum dose is 12 sprays per day although some patients may require and tolerate a higher number of sprays per day. In the treatment of cancer pain, the mean daily dosage after titration was 8 sprays per day. Dosage should be adjusted as necessary, based on effect and tolerance. Sprays should be evenly distributed over the course of the day during initial titration. If adverse reactions, including intoxication-type symptoms, are noted the dosage should be suspended until resolution of the symptoms; a dosage reduction or extension of the interval between doses may be used to avoid a recurrence of symptoms. Retitration may be required in the event of adverse reactions and/or worsening of symptoms.

Dosing: ElderlyRefer to adult dosing. Use with caution and monitor closely.

Dosing: Renal Impairment

Use with caution; has not been studied in patients with significant renal dysfunction.

Dosing: Hepatic Impairment

Use with caution; has not been studied in patients with significant hepatic dysfunction.

Administration: Oral**Note:** For buccal use only; spray should be directed below the tongue or on the inside of the cheeks (the site should be varied); avoid direction to the pharynx.

Shake vial before use and remove protective cap; replace protective cap following use. Do not apply spray to sore or inflamed mucosa.

Priming: Vial should be held in an upright position and primed prior to the initial use by depression of the actuator 2-3 times until a fine spray appears. Priming should not be required for subsequent uses. Do not spray near an open flame.

Normal use: Hold vial in upright position and spray into mouth; spray should be directed below the tongue or on the inside of the cheeks, avoiding direction to the pharynx. The site should be varied.

StoragePrior to first use, store unopened at 2°C to 8°C (36°F to 46°F); do not freeze. After opening, may be stored at room temperature of 15°C to 25°C (59°F to 77°F) for up to 28 days. Avoid heat and direct sunlight.

RestrictionsNot available in U.S.; CDSA-II

ContraindicationsHypersensitivity to cannabinoids or any component of the formulation; serious cardiovascular disease (including arrhythmias, severe heart failure, poorly controlled hypertension, and ischemic heart disease); history of psychotic disorders (including schizophrenia); women of childbearing potential who are not using a reliable form of contraception; males intending to start a family; children <18 years of age; pregnancy; breast-feeding

Warnings/Precautions

Boxed warnings:

- Ethanol/sedatives: See “Concurrent drug therapy issues” below.
- Cardiovascular effects: See “Concerns related to adverse effects” below.
- CNS effects: See “Concerns related to adverse effects” below.
- Physical/psychological dependence: See “Disease-related concerns” below.
- Prescribing restrictions: See “Other warnings/precautions” below.
- Seizures: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Buccal mucosa irritation: May be irritating to the buccal mucosa; avoid administration in an area of soreness or inflammation.

- Cardiovascular effects: **[Canadian Boxed Warning]: May be associated with adverse cardiovascular effects, including tachycardia and alterations in blood pressure (including orthostatic changes).** Dosage must be carefully titrated and monitored, with downward adjustment in patients with unacceptable adverse events. Use is contraindicated in ischemic heart disease, arrhythmias, poorly-controlled hypertension, and severe heart failure).

- CNS effects: **[Canadian Boxed Warning]: Use may be associated with dizziness, changes in mood, cognitive performance, memory, impulsivity, and coordination, as well as an altered perception of reality, particularly with respect to an awareness/sensation of time.** Adverse effects are dose-dependent and vary among patients. Dose reductions, greater intervals between doses, or interrupting therapy may resolve unwanted effects. Drug discontinuation is recommended, and a period of close observation should be instituted, in patients experiencing a psychotic reaction. May impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Genitourinary effects: Use caution in cancer patients. Increased risk for urinary retention and infection.

Disease-related concerns:

- Drug abuse: **[Canadian Boxed Warning]: Potential for drug dependency exists. Tolerance, psychological, and physical dependence may occur with prolonged use.** Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists.

- Hepatic dysfunction: Use in patients with significant hepatic dysfunction has not been studied. Use with caution.

- Renal dysfunction: Use in patients with significant renal dysfunction has not been studied. Use with caution.

- Seizure disorder: **[Canadian Boxed Warning]: Use with caution in patients with a history of seizure disorder.**

Concurrent drug therapy issues:

- Ethanol/sedatives: **[Canadian Boxed Warning]: Concurrent use with other sedatives, psychotropics, hypnotics, or ethanol may potentiate adverse CNS effects.**

Dosage form specific issues:

- Ethanol: Formulation contains ethanol; use with caution in alcoholism.

Other warnings/precautions:

- Prescribing restrictions: **[Canadian Boxed Warning]: Prescriptions should be written for the minimal amount needed between clinic visits.**

- Toxicology screen: Cannabinoids may be detectable in the urine and serum for several weeks following drug discontinuation.

Special populations:

- Elderly: Use with caution in the elderly. Close monitoring of this patient population is required.

Pregnancy ConsiderationsCannabinoids have been associated with reproductive toxicity. Animal studies indicate possible effects on fetal development and spermatogenesis. Use in pregnancy is contraindicated. Women of childbearing potential and males who are capable of causing pregnancy should use a reliable form of contraception for the duration of treatment and for 3 months following discontinuation.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsCannabinoids may concentrate in breast milk. Use is contraindicated.

Adverse Reactions

>10%:

Central nervous system: Dizziness (up to 32%), somnolence (9% to 15%), fatigue (14%)

Gastrointestinal: Oral application site events (≤20%), nausea (12%)

1% to 10%:

Cardiovascular: Hypotension (2% to 5%), hypertension (2%), flushing (1%), syncope (1%),

Central nervous system: Confusion (1% to 7%), disorientation (5%), vertigo (4% to 5%), attention disturbance (3% to 5%), impaired balance (3% to 5%), dissociation (3%), euphoria (3%), headache (3%), insomnia (3%), panic attack (3%), hallucination (up to 3%), amnesia (2%), anxiety (2%), lethargy (2%), malaise (2%), depression (1% to 2%), memory impairment (1%), paranoia (1%)

Endocrine & metabolic: Thirst (1%)

Gastrointestinal: Xerostomia (8%), vomiting (4% to 8%), oral discomfort/pain (up to 8%), diarrhea (5% to 7%), constipation (4% to 5%), abnormal taste (4%), tooth discoloration (4%), dysgeusia (3% to 5%), oral candidiasis (3%), anorexia (2%), appetite increased (2%), abdominal pain (1%), appetite decreased (1%)

Genitourinary: Urinary retention (5%)

Hepatic: ALT increased, AST increased (2.6%)

Neuromuscular & skeletal: Weakness (5% to 6%), muscle spasticity (3%), dysarthria (2%), fall (2%), paresthesia (2%)

Ocular: Vision blurred (2%)

Renal: Hematuria (3%)

Respiratory: Pharyngitis (2%), cough (1%), respiratory tract infection (1%), throat irritation (1%)

Miscellaneous: Drunken feeling (5%), sensation of heaviness (1%)

<1% and/or frequency not defined: Auditory hallucination, delusions, suicidal ideation, tachycardia, urinary infection

Metabolism/Transport Effects **Substrate** (minor) of CYP2C9, 2C19, 2D6, 3A4; **Inhibits** (weak) CYP1A2, 2C19, 2D6, 3A4

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergic Agents: May enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Cocaine: May enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Sympathomimetics: Cannabinoids may enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Administration with high-lipid meals may increase absorption.

Monitoring Parameters Mental status, response to pain; mucosal integrity and inflammation

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Solution, buccal [spray]:

Sativex® [CAN]: Delta-9 tetrahydrocannabinol 27 mg/mL and cannabidiol 25 mg/mL (5.5 mL) [delivers 100 microliters/spray; 51 metered sprays; contains ethanol 50%, peppermint oil, and propylene glycol] [not available in U.S.]

Generic Available No

Manufacturer

Bayer Canada

Mechanism of Action Stimulates cannabinoid receptors CB1 and CB2 in the CNS and dorsal root ganglia as well as other sites in the body. Cannabinoid receptors in the pain pathways of the brain and spinal cord mediate cannabinoid-induced analgesia. Peripheral CB2 receptors modulate immune function through cytokine release.

Pharmacodynamics/Kinetics

Absorption: Rapidly absorbed from the buccal mucosa

Distribution: Widely distributed, particularly to fatty tissues

Protein binding: Extensive

Metabolism: Hepatic, via CYP isoenzymes (2C9, 2C19, 2D6 and 3A4) to THC metabolite 11-hydroxy-tetrahydrocannabinol (11-OH-THC, psycho-active) and CBD metabolite 7-hydroxy-cannabidiol.

Half-life elimination: Initial: 1-2 hours; terminal half-life may require 24-36 hours (or longer) due to redistribution from fatty tissue

Time to peak, plasma: 2-4 hours

Excretion: As metabolites, urine and feces

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), abnormal taste, oral pain, orthostatic hypotension; administered as buccal spray, associated with irritation to the buccal (oral) mucosa.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Dizziness and fatigue are common; may cause mood changes (euphoria, depression), memory impairment, disorientation, dissociation, and impulsivity.

Mental Health: Effects on Psychiatric Treatment Contraindicated in patients with a history of psychotic disorders.

Index Terms Cannabidiol and Tetrahydrocannabinol; Delta-9-Tetrahydrocannabinol and Cannabinol; GW-1000-02; THC and CBD

Pharmacologic CategoryAdrenergic Agonist Agent; Imidazoline Derivative; Ophthalmic Agent, Vasoconstrictor

Use: Labeled IndicationsSymptomatic relief of nasal congestion and conjunctival congestion

Dosing: Adults

Nasal congestion: Intranasal: Instill 2-4 drops or 3-4 sprays of 0.1% solution every 3-4 hours as needed, no more frequent than every 3 hours

Conjunctival congestion: Ophthalmic: Instill 1-2 drops in each eye 2-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNasal congestion: Intranasal:

Children 2-6 years: Instill 2-3 drops of 0.05% solution every 4-6 hours as needed, no more frequent than every 3 hours.

Children >6 years: Refer to adult dosing.

StorageDo not use if solution changes color or becomes cloudy.

Geriatric ConsiderationsUse with caution in patients with cardiovascular disease.

Pregnancy Risk FactorC

Adverse Reactions

>10%:

Local: Transient stinging

Thalidomide-Dexamethasone

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Multiple Myeloma

Regimen Use Multiple myeloma

Index Terms Dexamethasone-Thalidomide

Regimen Note: Multiple variations are listed below.

Variation 1:

Thalidomide: Oral: 100 mg/day days 1 to 28

[total dose/cycle = 2800 mg]

Dexamethasone: Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Repeat cycle every 28 days

Variation 2:

Thalidomide: Oral: 200 mg/day days 1 to 14 cycle 1

followed by Oral: 400 mg/day days 15 to 28 cycle 1

[total dose/cycle = 8400 mg]

Thalidomide: Oral: 400 mg/day days 1 to 28 (subsequent cycles)

[total dose/cycle = 11,200 mg]

Dexamethasone: Oral: 20 mg/m^2/day days 1 to 4, 9 to 12, and 17 to 20 cycle 1 (subsequent cycles)

[total dose/cycle = 240 mg/m^2]

Dexamethasone: Oral 20 mg/m^2/day days 1 to 4 (subsequent cycles)

[total dose/cycle = 80 mg/m^2]

Repeat cycle every 28 days

Variation 3:

Thalidomide: Oral: 100 mg/day days 1 to 7, 150 mg/day days 8 to 14, 200 mg/day days 15 to 21, 250 mg/day days 22 to 28, and 300 mg/day days 29 to 35 (cycle 1)

[total dose/cycle = 7000 mg]

Thalidomide: Oral: 300 mg/day days 1 to 35 (subsequent cycles)

[total dose/cycle = 10,500 mg]

Dexamethasone: Oral: 20 mg/m^2/day days 1 to 4, 9 to 12, and 17 to 20

[total dose/cycle = 240 mg/m^2]

Repeat cycle every 35 days

Variation 4:

Thalidomide: Oral: 200 mg/day days 1 to 28

[total dose/cycle = 5600 mg]

Dexamethasone: Oral: 40 mg/day days 1 to 4, 9 to 12, and 17 to 20 (odd cycles)

[total dose/cycle = 480 mg]

Dexamethasone: Oral: 40 mg/day days 1 to 4 (even cycles)

[total dose/cycle = 160 mg]

Repeat cycle every 28 days

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Thalidomide may be confused with flutamide

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Thalomid® may be confused with Thilomide® which is a brand name for lodoxamide in Greece and Turkey

Pronunciation(tha LI doe mide)

U.S. Brand NamesThalomid®

Canadian Brand NamesThalomid®

Pharmacologic CategoryAngiogenesis Inhibitor; Immunomodulator, Systemic; Tumor Necrosis Factor (TNF) Blocking Agent

Use: Labeled IndicationsTreatment of multiple myeloma; treatment and maintenance of cutaneous manifestations of erythema nodosum leprosum (ENL)

Use: Unlabeled/InvestigationalTreatment of Crohn's disease; graft-versus-host reactions after bone marrow transplantation; AIDS-related aphthous stomatitis; Behçet's syndrome; Waldenström's macroglobulinemia; Langerhans cell histiocytosis; may be effective in rheumatoid arthritis, discoid lupus erythematosus, and erythema multiforme

Dosing: Adults

Cutaneous ENL: Oral:

Initial: 100-300 mg/day taken once daily at bedtime with water (at least 1 hour after evening meal)

Adjustments to initial dose:

Patients weighing <50 kg: Initiate at lower end of the dosing range

Severe cutaneous reaction or patients previously requiring high dose: May be initiated at 400 mg/day; doses may be divided, but taken 1 hour after meals

Duration and tapering/maintenance:

Dosing should continue until active reaction subsides (usually at least 2 weeks), then tapered in 50 mg decrements every 2-4 weeks

Note: Patients who flare during tapering or with a history or requiring prolonged maintenance should be maintained on the minimum dosage necessary to control the reaction. Efforts to taper should be repeated every 3-6 months, in increments of 50 mg every 2-4 weeks.

Multiple myeloma: 200 mg once daily (with dexamethasone 40 mg daily on days 1-4, 9-12, and 17-20 of a 28-day treatment cycle)

Behçet's syndrome (unlabeled use): Oral: 100-400 mg/day

Graft-vs-host reactions (unlabeled use): Oral: 100-1600 mg/day; usual initial dose: 200 mg 4 times/day for use up to 700 days

AIDS-related aphthous stomatitis (unlabeled use): Oral: 200 mg twice daily for 5 days, then 200 mg/day for up to 8 weeks

Discoid lupus erythematosus (unlabeled use): Oral: 100-400 mg/day; maintenance dose: 25-50 mg

Dosing: ElderlyRefer to adult dosing.

Dosing: Combination Regimens

Multiple myeloma:

Bortezomib-Melphalan-Prednisone-Thalidomide

DTPACE

Melphalan-Prednisone-Thalidomide

Thalidomide-Dexamethasone

Prostate cancer: Docetaxel-Thalidomide

Administration: OralAdminister with water, preferably at bedtime once daily on an empty stomach, at least 1 hour after the evening meal. Doses >400 mg/day may be given in 2-3 divided doses. Avoid extensive handling of capsules; capsules should remain in blister pack until ingestion. If exposed to the powder content from broken capsules or body fluids from patients receiving thalidomide, the exposed area should be washed with soap and water.

Dietary ConsiderationsShould be taken at least 1 hour after the evening meal.

StorageStore at 15°C to 30°C (50°F to 86°F). Protect from light. Keep in original package.

RestrictionsThalidomide is approved for marketing only under a special distribution program. This program, called the "System for Thalidomide Education and Prescribing Safety" (STEPS® 1-888-423-5436), has been approved by the FDA. Prescribers and pharmacists must be registered with the program. No more than a 4-week supply should be dispensed. Blister packs should be dispensed intact (do not repackage capsules). Prescriptions must be filled within 7 days. Subsequent prescriptions may be filled only if fewer than 7 days of therapy remain on the previous prescription. A new prescription is required for further dispensing (a telephone prescription may not be accepted.)

ContraindicationsHypersensitivity to thalidomide or any component of the formulation; neuropathy (peripheral); patient unable to comply with STEPS® program (including males); women of childbearing potential unless alternative therapies are inappropriate and adequate precautions are taken to avoid pregnancy; pregnancy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.
- Thromboembolic events: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bradycardia: May cause bradycardia; use with caution in patients with cardiovascular disease.
- Hypersensitivity/skin reactions: Hypersensitivity, Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN) have been reported; withhold therapy and evaluate with skin rashes; permanently discontinue if rash is exfoliative, purpuric, bullous or if SJS or TEN is suspected.
- Neutropenia: May cause neutropenia; discontinue therapy if absolute neutrophil count decreases to <750/mm^3.
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients who would not tolerate transient hypotensive episodes.
- Peripheral neuropathy: Use has been associated with the development of peripheral neuropathy, which may be irreversible; use caution with other medications which may cause peripheral neuropathy. Consider immediate discontinuation (if clinically appropriate) in patients who develop neuropathy.
- Sedation: May cause sedation; patients must be warned to use caution when performing tasks which require alertness.
- Seizures: May cause seizures; use caution in patients with a history of seizures, concurrent therapy with drugs which alter seizure threshold, or conditions which predispose to seizures.
- Thromboembolic events: **[U.S. Boxed Warning]: Thrombotic events have been reported, generally in patients with other risk factors for thrombosis (neoplastic disease, inflammatory disease, or concurrent therapy with combination chemotherapy). Use in combination with dexamethasone is associated with increased risk for deep vein thrombosis (DVT) and pulmonary embolism (PE). Monitor for signs and symptoms of thromboembolism; patients at risk may benefit from prophylactic anticoagulation or aspirin.**

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Constipation: Use with caution in patients with constipation.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Neurological disorders: Use with caution in patients with neurological disorders, including seizure disorder.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Contraceptives: Use with caution with drugs which may decrease the efficacy of hormonal contraceptives.

Special populations:

- HIV infected patients: Use with caution in patients with HIV infection; has been associated with increased viral loads.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.
- Pregnancy: **[U.S. Boxed Warning]: Thalidomide is a known teratogen; effective contraception must be used for at least 4 weeks before initiating therapy, during therapy, and for 4 weeks following discontinuation of thalidomide for women of childbearing potential.**

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Thalidomide is a known teratogen; effective contraception must be used for at least 4 weeks before**

initiating therapy, during therapy, and for 4 weeks following discontinuation of thalidomide for women of childbearing potential. Embryotoxic with limb defects noted from the 27th to 40th gestational day of exposure; all cases of phocomelia occur from the 27th to 42nd gestational day; fetal cardiac, gastrointestinal, bone, external ear, eye, and genitourinary tract abnormalities have also been described. Mortality at or shortly after birth has also been reported. Either abstinence or two forms of effective contraception must be used for at least 4 weeks before initiating therapy, during therapy, and for 4 weeks following discontinuation of thalidomide. A negative pregnancy test (sensitivity of at least 50 mIU/mL) within 24 hours prior to beginning therapy, weekly during the first 4 weeks, and every 4 weeks (every 2 weeks for women with irregular menstrual cycles) thereafter is required for women of childbearing potential. Males (even those vasectomized) must use a latex condom during any sexual contact with women of childbearing age. Risk to the fetus from semen of male patients is unknown. Thalidomide must be immediately discontinued and the patient referred to a reproductive toxicity specialist if pregnancy occurs during treatment. Any suspected fetal exposure to thalidomide must be reported to the FDA via the MedWatch program (1-800-FDA-1088) and to Celgene Corporation (1-888-423-5436).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the infant, a decision should be made to discontinue nursing or discontinue treatment with thalidomide.

Adverse Reactions

>10%:

Cardiovascular: Edema (57%), thrombosis/embolism (23%; grade 3: 13%, grade 4: 9%), hypotension (16%)

Central nervous system: Fatigue (79%; grade 3: 3%, grade 4: 1%), somnolence (36% to 38%), dizziness (4% to 20%), sensory neuropathy (54%), confusion (28%), anxiety/agitation (9% to 26%), fever (19% to 23%), motor neuropathy (22%), headache (13% to 19%)

Dermatologic: Rash (21% to 31%), rash/desquamation (30%; grade 3: 4%), dry skin (21%), maculopapular rash (4% to 19%), acne (3% to 11%)

Endocrine & metabolic: Hypocalcemia (72%)

Gastrointestinal: Constipation (3% to 55%), anorexia (3% to 28%), nausea (4% to 24%), weight loss (23%), weight gain (22%), diarrhea (4% to 19%), oral moniliasis (4% to 11%)

Hematologic: Leukopenia (17% to 35%), neutropenia (31%), anemia (6% to 13%), lymphadenopathy (6% to 13%)

Hepatic: AST increased (3% to 25%), bilirubin increased (14%)

Neuromuscular & skeletal: Muscle weakness (40%), tremor (4% to 26%), weakness (6% to 22%), myalgia (17%), paresthesia (6% to 16%), arthralgia (13%)

Renal: Hematuria (11%)

Respiratory: Dyspnea (42%)

Miscellaneous: Diaphoresis (13%)

1% to 10%:

Cardiovascular: Facial edema (4%), peripheral edema (3% to 8%)

Central nervous system: Insomnia (9%), nervousness (3% to 9%), malaise (8%), vertigo (8%), pain (3% to 8%)

Dermatologic: Dermatitis (fungal 4% to 9%), pruritus (3% to 8%), nail disorder (3% to 4%)

Endocrine & metabolic: Hyperlipemia (6% to 9%)

Gastrointestinal: Xerostomia (8% to 9%), flatulence (8%), tooth pain (4%)

Genitourinary: Impotence (3% to 8%)

Hepatic: LFTs abnormal (9%)

Neuromuscular & skeletal: Neuropathy (8%), back pain (4% to 6%), neck pain (4%), neck rigidity (4%)

Renal: Albuminuria (3% to 8%)

Respiratory: Pharyngitis (4% to 8%), rhinitis (4%), sinusitis (4% to 8%)

Miscellaneous: Infection (6% to 8%)

Postmarketing and/or case reports (limited to important or life-threatening): Acute renal failure, alkaline phosphatase increased, ALT increased, amenorrhea, aphthous stomatitis, arrhythmia, atrial fibrillation, bile duct obstruction, bradycardia, BUN increased, carpal tunnel, CML, creatinine clearance decreased, creatinine increased, deafness, depression, diplopia, dysesthesia, ECG abnormalities, electrolyte imbalances, enuresis, eosinophilia, epistaxis, erythema multiforme, erythema nodosum, erythroleukemia, exfoliative dermatitis, febrile neutropenia, foot drop, galactorrhea, granulocytopenia, gynecomastia, hepatomegaly, Hodgkin's disease, hypercalcemia, hyper-/hypokalemia, hypersensitivity, hypertension, hyper-/hypothyroidism, hyperuricemia, hypomagnesemia, hyponatremia, hypoproteinemia, intestinal obstruction, intestinal perforation, interstitial pneumonitis, LDH increased, lethargy, leukocytosis, lymphedema, lymphopenia, mental status changes, metrorrhagia, migraine, myxedema, nystagmus, oliguria, orthostatic hypotension, pancytopenia, paresthesia, petechiae, peripheral neuritis, photosensitivity, pleural effusion, prothrombin time changes, psychosis, pulmonary embolus, pulmonary hypertension, purpura, Raynaud's syndrome, seizure, status epilepticus, Stevens-Johnson syndrome, stomach ulcer, stupor, suicide attempt, syncope, tachycardia, thrombocytopenia, toxic epidermal necrolysis, tumor lysis syndrome

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Abatacept: Anti-TNF Agents may enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anakinra: Anti-TNF Agents may enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Dexamethasone: May enhance the dermatologic adverse effect of Thalidomide. Dexamethasone may enhance the thrombogenic effect of Thalidomide. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Pamidronate: Thalidomide may enhance the nephrotoxic effect of Pamidronate. *Risk C: Monitor therapy*

Rilonacept: Anti-TNF Agents may enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Zoledronic Acid: Thalidomide may enhance the adverse/toxic effect of Zoledronic Acid. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase sedation).

Herb/Nutraceutical: Avoid cat's claw and echinacea (have immunostimulant properties; consider therapy modifications).

Monitoring ParametersCBC with differential, platelets; signs of neuropathy monthly for the first 3 months, then periodically during treatment; consider monitoring of sensory nerve application potential amplitudes (at baseline and every 6 months) to detect asymptomatic neuropathy. In HIV-seropositive patients: viral load after 1 and 3 months, then every 3 months. Pregnancy testing (sensitivity of at least 50 mIU/mL) is required within 24 hours prior to initiation of therapy, weekly during the first 4 weeks, then every 4 weeks in women with regular menstrual cycles or every 2 weeks in women with irregular menstrual cycles.

Reference RangeTherapeutic plasma thalidomide levels in graft-vs-host reactions are 5-8 mcg/mL, although it has been suggested that lower plasma levels (0.5-1.5 mcg/mL) may be therapeutic; peak serum thalidomide level after a 200 mg dose: 1.2 mcg/mL

Nursing: Physical Assessment/MonitoringPatient must be capable of complying with STEPS® program. Instruct patient on risks of pregnancy, appropriate contraceptive measures, and necessity for frequent pregnancy testing (schedule pregnancy testing at time of dispensing and give patient schedule in writing). Assess other medications patient may be taking for possible interactions. Monitor for signs of fluid retention, weight gain, and blood pressure. Monitor closely for signs of neuropathy, neutropenia, and CNS depression. Instruct patient on signs and symptoms to report, and appropriate interventions for adverse reactions.

Pregnancy risk factor X: Pregnancy test is required within 24 hours prior to beginning therapy, weekly during first month of therapy, and monthly thereafter for all women of childbearing age. Effective contraception with at least two reliable forms of contraception must be used for 1 month prior to beginning therapy, during therapy, and for 1 month following discontinuance of therapy. Women who have undergone a hysterectomy or have been postmenopausal for at least 24 consecutive months are the only exception. Do not prescribe, administer, or dispense to women of childbearing age or males who may have intercourse with women of childbearing age unless both female and male are capable of complying with contraceptive measures. Even males who have undergone vasectomy must acknowledge these risks in writing, and must use a latex condom during any sexual contact with women of childbearing age. Oral and written warnings concerning contraception and the hazards of thalidomide must be conveyed to females and males and they must acknowledge their understanding in writing. Parents or guardians must consent and sign acknowledgment for patients between 12 and 18 years of age following therapy. Breast-feeding is contraindicated.

Monitoring: Lab Tests Pregnancy testing (sensitivity of at least 50 mIU/mL) is required within 24 hours prior to initiation of therapy, weekly during the first 4 weeks, then every 4 weeks in women with regular menstrual cycles or every 2 weeks in women with irregular menstrual cycles. In HIV-seropositive patients; monitor viral load after 1 and 3 months, then every 3 months. CBC with differential, platelets. Consider monitoring of sensory nerve application potential amplitudes at baseline and every 6 months to detect asymptomatic neuropathy.

Patient EducationYou will be given oral and written instructions about the necessity of using two methods of contraception and the necessity of keeping return visits for pregnancy testing. Do not donate blood while taking this medicine. Male patients should not donate sperm. Avoid extensive handling of capsules; capsules should remain in blister pack until ingestion. If exposed to the powder content from broken capsules or body fluids from patients receiving thalidomide, the exposed area should be washed with soap and water. Avoid alcohol. You may experience postural hypotension (use caution when rising from lying or sitting position); sleepiness; dizziness; fatigue; fever; headaches; lack of concentration (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation or diarrhea; oral thrush (frequent mouth care is necessary); or sexual dysfunction (reversible). Report any of the above if persistent or severe. Report chest pain or palpitations or swelling of extremities; respiratory difficulty; back, neck, muscle pain, muscle weakness, or stiffness; numbness or pain in extremities; significant weight loss or gain; skin rash or eruptions; increased nervousness, anxiety, confusion, or insomnia; or any other symptom of adverse reactions. **Pregnancy/breast-feeding precautions:** Do not get pregnant (females) or cause pregnancy (males) during treatment. The use of two forms of contraception are required for 1 month prior to therapy, during therapy, and for 1 month following discontinuation of therapy. Pregnancy tests will be routinely conducted during therapy. Consult prescriber if you suspect you might be pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not breast-feed while taking this medication or for 1 month following discontinuation.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Thalomid®: 50 mg, 100 mg, 200 mg

Generic AvailableNo

ManufacturerCelgene Corp

Mechanism of ActionHas immunomodulatory and antiangiogenic characteristics. Immunologic effects may vary based on conditions; may suppress excessive tumor necrosis factor-alpha production in patients with ENL, yet may increase plasma tumor necrosis factor-alpha levels in HIV-positive patients. In multiple myeloma, thalidomide is associated with an increase in natural killer cells and increased levels of interleukin-2 and interferon gamma. Other proposed mechanisms of action include suppression of angiogenesis, prevention of free-radical-mediated DNA damage, increased cell mediated cytotoxic effects, and altered expression of cellular.

Pharmacodynamics/Kinetics

Distribution: V_d: 120 L

Protein binding: 55% to 66%

Metabolism: Nonenzymatic hydrolysis in plasma; forms multiple metabolites

Half-life elimination: 5-7 hours

Time to peak, plasma: 3-6 hours

Excretion: Urine (<1% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral moniliasis (HIV-seropositive patients), toothache, xerostomia (normal salivary flow resumes upon discontinuation), and aphthous stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause dizziness, nervousness, insomnia, agitation, abnormal thinking, amnesia, anxiety, confusion, depression, euphoria, and psychosis

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with other psychotropics may produce additive sedation

Pregnancy Risk FactorC
LactationEnters breast milk/compatible
Metabolism/Transport EffectsTheophylline: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (major), 3A4 (major); **Inhibits** CYP1A2 (weak)
Drug Interactions

Adenosine: Theophylline Derivatives may diminish the therapeutic effect of Adenosine. *Risk D: Consider therapy modification*

Allopurinol: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Benzodiazepines: Theophylline Derivatives may diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Interferons: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Lithium: Theophylline Derivatives may increase the excretion of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Theophylline Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin; Telithromycin. *Risk D: Consider therapy modification*

Mexiletine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Moricizine: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Pentoxifylline: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Theophylline Derivatives. Theophylline Derivatives may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Amprenavir; Fosamprenavir. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Sparfloxacin; Trovafloxacin. *Risk D: Consider therapy modification*

Regadenoson: Theophylline may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tacrine: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Thiabendazole: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Thyroid Products: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Ticlopidine: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Zafirlukast: Theophylline Derivatives may decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Zileuton: May increase the serum concentration of Theophylline. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Pharmacologic CategoryTheophylline Derivative

Use: Labeled IndicationsTreatment of symptoms and reversible airway obstruction due to chronic asthma, or other chronic lung diseases; apnea of prematurity

Note: The National Heart, Lung, and Blood Institute Guidelines (2007) do not recommend oral theophylline as a long-term control medication for asthma in children ≤4years of age; use may be considered as an alternative (but not preferred) agent in older children and adults. The guidelines do not recommend theophylline I.V. for the treatment of exacerbations of asthma.

Dosing: Adults**Note:** Doses should be individualized based on peak serum concentrations and should be based on ideal body weight.
Acute symptoms: Loading dose: Oral, I.V.:

If no theophylline received within the previous 24 hours: 4.6 mg/kg loading dose (~5.8 mg/kg hydrous aminophylline) I.V. or 5 mg/kg orally. Loading dose intended to achieve a serum level of approximately 10 mcg/mL; loading doses should be given intravenously (preferred) or with a rapidly absorbed oral product (not an extended-release product). **Note:** On the average, for every 1 mg/kg theophylline given, blood levels will rise 2 mcg/mL.

If theophylline has been administered in the previous 24 hours: A loading dose is not recommended without obtaining a serum theophylline concentration. The loading dose should be calculated as follows:

Dose = (desired serum theophylline concentration - measured serum theophylline concentration) (V_d)

Acute symptoms: Maintenance dose: I.V.: **Note:** To achieve a target concentration of 10 mcg/mL unless otherwise noted. Lower initial doses may be required in patients with reduced theophylline clearance. Dosage should be adjusted according to serum level measurements during the first 12- to 24-hour period.

Adults 16-60 years (otherwise healthy, nonsmokers): 0.4 mg/kg/hour; maximum 900 mg/day unless serum levels indicate need for larger dose

Adults >60 years: 0.3 mg/kg/hour; maximum 400 mg/day unless serum levels indicate need for larger dose

Cardiac decompensation, cor pulmonale, hepatic dysfunction, sepsis with multiorgan failure, shock: 0.2 mg/kg/hour; maximum 400 mg/day unless serum levels indicate need for larger dose

Treatment of chronic conditions: Oral:

Adults 16-60 years **without** risk factors for impaired theophylline clearance: 300 mg/day in divided doses every 6-8 hours for 3 days, then increase to 400 mg/day in divided doses every 6-8 hours for 3 days; maintenance dose: 600 mg/day in divided doses every 6-8 hours

Increase dose only if tolerated. Consider lowering dose or using a slower titration if caffeine-like adverse events occur. Smaller doses given more frequently may be used in patients with a more rapid metabolism to prevent breakthrough symptoms which could occur due to low trough concentration prior to the next dose. Reliably absorbed slow release formulations can be used to decrease serum fluctuations and permit longer dosing intervals.

Dose adjustment in patients **with** risk factors for impaired theophylline clearance and patients in whom monitoring serum theophylline levels is not feasible: Do not exceed a dose of 400 mg/day

Dosage adjustment after serum theophylline measurement:

Within normal limits: 10-19.9 mcg/mL: Maintain dosage if tolerated. Recheck serum theophylline concentration at 24-hour intervals (for acute I.V. dosing) or at 6- to 12-month intervals (for oral dosing). Finer adjustments in dosage may be needed for some patients. If levels ≥15 mcg/mL, consider 10% dose reduction to improve safety margin.

Too high:

20-24.9 mcg/mL: Decrease doses by about 25%. Recheck serum theophylline concentrations (see "Note").

25-30 mcg/mL: Skip next dose (oral) or stop infusion for 12 hours (children) or 24 hours (adults) and decrease subsequent doses by about 25%. Recheck serum theophylline concentrations (see "Note").

>30 mcg/mL: Stop dosing and treat overdose; if resumed, decrease subsequent doses by 50%. Recheck serum theophylline concentrations (see "Note").

Too low: <9.9 mcg/mL: If tolerated, but symptoms remain, increase dose by about 25%. Recheck serum theophylline concentrations (see "Note").

Note: Recheck serum theophylline levels after 3 days when using oral dosing, or after 12 hours (children) or 24 hours (adults) when dosing intravenously. Patients maintained with oral therapy may be reassessed at 6- to 12-month intervals.

Dosing: Elderly

Acute symptoms: Adults >60 years:

Loading dose: Oral, I.V.: Refer to adult dosing.

Maintenance dose: I.V.: 0.3 mg/kg/hour; maximum 400 mg/day unless serum levels indicate need for larger dose

Chronic conditions: Oral: Adults >60 years: Do not exceed a dose of 400 mg/day

Cardiac decompensation, cor pulmonale, hepatic dysfunction, sepsis with multiorgan failure, shock: Refer to adult dosing.

Dosing: Pediatric**Note:** Doses should be individualized based on peak serum concentrations and should be based on ideal body weight.
Acute symptoms: Loading dose: Oral, I.V.:

If no theophylline received within the previous 24 hours: 4.6 mg/kg loading dose (~5.8 mg/kg hydrous aminophylline) I.V. or 5 mg/kg orally. Loading dose intended to achieve a serum level of approximately 10 mcg/mL; loading doses should be given intravenously (preferred) or with a rapidly absorbed oral product (not an extended-release product). **Note:** On the average, for every 1 mg/kg theophylline given, blood levels will rise 2 mcg/mL.

If theophylline has been administered in the previous 24 hours: A loading dose is not recommended without obtaining a serum theophylline concentration. The loading dose should be calculated as follows:

Dose = (desired serum theophylline concentration - measured serum theophylline concentration) (V_d)

Acute symptoms: Maintenance dose: I.V.: **Note:** To achieve a target concentration of 10 mcg/mL unless otherwise noted. Lower initial doses may be required in patients with reduced theophylline clearance. Dosage should be adjusted according to serum level measurements during the first 12- to 24-hour period.

Neonates ≤24 days: 1 mg/kg every 12 hours to achieve a target concentration of 7.5 mcg/mL for apnea of prematurity

Neonates >24 days: 1.5 mg/kg every 12 hours to achieve a target concentration of 7.5 mcg/mL for apnea of prematurity

Infants 6-52 weeks: mg/kg/hour = (0.008) (age in weeks) + 0.21

Children 1-9 years: 0.8 mg/kg/hour

Children 9-12 years: 0.7 mg/kg/hour

Adolescents >16 years: Refer to adult dosing.

Adolescents 12-16 years (cigarette or marijuana smokers): 0.7 mg/kg/hour

Adolescents 12-16 years (nonsmokers): 0.5 mg/kg/hour; maximum 900 mg/day unless serum levels indicate need for larger dose

Dosage adjustment for cardiac decompensation, cor pulmonale, hepatic dysfunction, sepsis with multiorgan failure, shock: 0.2 mg/kg/hour; maximum 400 mg/day unless serum levels indicate need for larger dose

Treatment of chronic conditions: Oral:

Infants <1 year: **Note:** Doses should be adjusted to maintain the peak steady state serum concentrations. The time to reach steady state will vary based on age and the presence of risk factors which may affect theophylline clearance. Theophylline serum levels obtained prior to reaching steady state should not be used to increase the maintenance dose even if the serum concentration is <10 mcg/mL. Peak steady state theophylline serum concentrations should be 5-10 mcg/mL in neonates and 10-15 mcg/mL in older infants.

Premature Neonates <24 days postnatal age: 1 mg/kg/dose every 12 hours

Premature Neonates ≥24 days postnatal age: 1.5 mg/kg/dose every 12 hours

Full-term Infants and Infants <26 weeks of age: Total daily dose (mg)= [(0.2 x age in weeks) +5] x (weight in kg); divide dose into 3 equal amounts and administer at 8-hour intervals

Full-term Infants and Infants ≥26 weeks and <52 weeks: Total daily dose (mg) = [(0.2 x age in weeks) +5] x (weight in kg); divide dose into 4 equal amounts and administer at 6-hour intervals

Children 1-15 years and <45 kg **without** risk factors for impaired theophylline clearance: 12-14 mg/kg/day in divided doses, every 4-6 hours for 3 days (maximum dose: 300 mg/day), then increase to 16 mg/kg/day in divided doses every 4-6 hours for 3 days (maximum dose: 400 mg/day); maintenance dose: 20 mg/kg/day in divided doses every 4-6 hours (maximum dose: 600 mg/day)

Increase dose only if tolerated. Consider lowering dose or using a slower titration if caffeine-like adverse events occur. Smaller doses given more frequently may be used in patients with a more rapid metabolism to prevent breakthrough symptoms which could occur due to low trough concentration prior to the next dose. Reliably absorbed slow release formulations can be used to decrease serum fluctuations and permit longer dosing intervals.

Children ≥16 years or >45 kg: Refer to adult dosing.

Dose adjustment in patients **with** risk factors for impaired theophylline clearance and patients in whom monitoring serum theophylline levels is not feasible:

Children 1-15 years: Do not exceed a dose of 16 mg/kg/day or 400 mg/day

Children ≥16: Do not exceed a dose of 400 mg/day

Dosage adjustment after serum theophylline measurement: Refer to adult dosing.

Calculations

- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V. DetailpH: 4.3

Administration: OralLong-acting preparations should be taken with a full glass of water, swallowed whole, or cut in half if scored. Do **not** crush. Extended release capsule forms may be opened and the contents sprinkled on soft foods; do **not** chew beads.

Dietary ConsiderationsShould be taken with water 1 hour before or 2 hours after meals. Premixed injection may contain corn-derived dextrose and its use is contraindicated in patients with allergy to corn-related products.

StorageElixir, tablet, premixed infusion: Store at controlled room temperature of 25°C (77°F).

CompatibilityStable in D_5W.

Y-site administration: Compatible: Acyclovir, ampicillin, ampicillin/sulbactam, aztreonam, bivalirudin, cefazolin, cefotetan, ceftriaxone, cimetidine, cisatracurium, clindamycin, clonidine, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, dobutamine, dopamine, doxycycline, erythromycin lactobionate, famotidine, fenoldopam, fluconazole, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, hetastarch in lactated electrolyte injection, lidocaine, linezolid, methyldopate, methylprednisolone sodium succinate, metronidazole, micafungin, midazolam, milrinone, nafcillin, nitroglycerin, oxaliplatin, penicillin G potassium, piperacillin, potassium chloride, ranitidine, remifentanil, sodium nitroprusside, ticarcillin, ticarcillin/clavulanate potassium, tigecycline, tobramycin, vancomycin. **Incompatible:** Cefepime, hetastarch in NS, phenytoin.

Compatibility when admixed: Compatible: Cefepime, chlorpromazine, fluconazole, furosemide, hydrocortisone hemisuccinate, lidocaine, methylprednisolone sodium succinate, papaverine, verapamil. **Incompatible:** Ascorbic acid injection, ceftriaxone.

ContraindicationsHypersensitivity to theophylline or any component of the formulation; premixed injection may contain corn-derived dextrose and its use is contraindicated in patients with allergy to corn-related products

Warnings/Precautions

Concerns related to adverse effects:

- Theophylline toxicity: If a patient develops signs and symptoms of theophylline toxicity (eg, persistent, repetitive vomiting), a serum level should be measured and subsequent doses held. Theophylline clearance may be decreased in patients with acute pulmonary edema, congestive heart failure, cor pulmonale, fever, hepatic disease, acute hepatitis, cirrhosis, hypothyroidism, sepsis with multiorgan failure, and shock; clearance may also be decreased in neonates, infants <3 months of age with decreased renal function, children <1 year of age, the elderly >60 years of age, and patients following cessation of smoking.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with tachyarrhythmias (eg, sinus tachycardia, atrial fibrillation) since use may exacerbate these arrhythmias.

- Hyperthyroidism: Use with caution in patients with hyperthyroidism; use may exacerbate this condition.

- Peptic ulcer disease: Use with caution in patient with peptic ulcer disease; use may exacerbate this condition.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; use may exacerbate this condition.

Other warnings/precautions:

- Dosage adjustments: Due to potential saturation of theophylline clearance at serum levels within (or in some patients less than) the therapeutic range, dosage adjustment should be made in small increments (maximum: 25% reduction).

- Monitoring: Due to wide interpatient variability, theophylline serum level measurements must be used to optimize therapy and prevent serious toxicity.

Geriatric ConsiderationsAlthough there is a great intersubject variability for half-lives of methylxanthines (2-10 hours), elderly as a group have slower hepatic clearance. Therefore, use lower initial doses and monitor closely for response and adverse reactions. Additionally, elderly are at greater risk for toxicity due to concomitant disease (eg, CHF, arrhythmias), and drug use (eg, cimetidine, ciprofloxacin).

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in animal reproduction studies. Theophylline crosses the placenta; adverse effects may be seen in the newborn. Use is generally safe when used at the recommended doses (serum concentrations 5-12 mcg/mL) however maternal adverse events may be increased and efficacy may be decreased in pregnant women. Theophylline metabolism may change during pregnancy; the half-life is similar to that observed in otherwise healthy, nonsmoking adults with asthma during the first and second trimesters (~8.7 hours), but may increase to 13 hours (range 8-18 hours) during the third trimester. The volume of distribution is also increased during the third trimester. Monitor serum levels. The recommendations for the use of theophylline in pregnant women with asthma are similar to those used in nonpregnant adults (National Heart, Lung, and Blood Institute Guidelines, 2004).

LactationEnters breast milk/compatible (AAP rates “compatible”)

Breast-Feeding ConsiderationsThe concentration of theophylline in breast milk is similar to the maternal serum concentration. Irritability may be observed in the nursing infant. Serious adverse events in the infant are unlikely unless toxic serum levels are present in the mother.

Adverse ReactionsFrequency not defined. Adverse events observed at therapeutic serum levels:

Cardiovascular: Flutter, tachycardia

Central nervous system: Headache, hyperactivity (children), insomnia, restlessness, seizures

Endocrine & metabolic: Hypercalcemia (with concomitant hyperthyroid disease)

Gastrointestinal: Nausea, reflux or ulcer aggravation, vomiting

Genitourinary: Difficulty urinating (elderly males with prostatism)

Neuromuscular & skeletal: Tremor

Renal: Diuresis (transient)

Metabolism/Transport Effects **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (major), 3A4 (major); **Inhibits** CYP1A2 (weak)
Drug Interactions

Adenosine: Theophylline Derivatives may diminish the therapeutic effect of Adenosine. *Risk D: Consider therapy modification*

Allopurinol: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Benzodiazepines: Theophylline Derivatives may diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Interferons: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Lithium: Theophylline Derivatives may increase the excretion of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Theophylline Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin; Telithromycin. *Risk D: Consider therapy modification*

Mexiletine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Moricizine: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Pentoxifylline: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Theophylline Derivatives. Theophylline Derivatives may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Amprenavir; Fosamprenavir. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Sparfloxacin; Trovafloxacin. *Risk D: Consider therapy modification*

Regadenoson: Theophylline may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tacrine: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Thiabendazole: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Thyroid Products: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Ticlopidine: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Zafirlukast: Theophylline Derivatives may decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Zileuton: May increase the serum concentration of Theophylline. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food does not appreciably affect the absorption of liquid, fast-release products, and most sustained release products; however, food may induce a sudden release (dose-dumping) of once-daily sustained release products resulting in an increase in serum drug levels and potential toxicity. Avoid excessive amounts of caffeine. Avoid extremes of dietary protein and carbohydrate intake. Changes in diet may affect the elimination of theophylline; charbroiled foods may increase elimination, reducing half-life by 50%.

Test InteractionsPlasma glucose, uric acid, free fatty acids, total cholesterol, HDL, HDL/LDL ratio, and urinary free cortisol excretion may be increased by theophylline. Theophylline may decrease triiodothyronine.

Monitoring ParametersMonitor heart rate, CNS effects (insomnia, irritability); respiratory rate (COPD patients often have resting controlled respiratory rates in low 20s); arterial or capillary blood gases (if applicable)

Theophylline levels: Serum theophylline levels should be monitored prior to making dose increases; in the presence of signs or symptoms of toxicity; or when a new illness, worsening of a present illness, or medication changes occur that may change theophylline clearance

I.V. loading dose: Measure serum concentrations 30 minutes after the end of an I.V. loading dose

I.V. infusion: Measure serum concentrations one half-life after starting a continuous infusion, then every 12-24 hours

Reference RangeTherapeutic levels:

Asthma: 5-15 mcg/mL (peak level)

Toxic concentration: >20 mcg/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy (respiratory rate, lung sounds, characteristics of cough and sputum) and adverse reactions at beginning of therapy and periodically with long-term use. For inpatient care, monitor vital signs and lung sounds prior to and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsArterial or capillary blood gases (if applicable)

Theophylline levels: Serum theophylline levels should be monitored prior to making dose increases; in the presence of signs or symptoms of toxicity; or when a new illness, worsening of a present illness, or medication changes occur that may change theophylline clearance

I.V. loading dose: Measure serum concentrations 30 minutes after the end of an I.V. loading dose

I.V. infusion: Measure serum concentrations one half-life after starting a continuous infusion, then every 12-24 hours

Patient EducationTake exactly as directed; do not exceed recommended dosage. Avoid smoking (smoking may interfere with drug absorption as well as exacerbate condition for which medication is prescribed). If you are smoking when dosage is prescribed; inform prescriber if you stop smoking (dosage may need to be adjusted to prevent toxicity). Preferable to take on empty stomach, 1 hour before or 2 hours after meals, with a full glass of water. Do not chew of crush sustained release forms; capsules may be opened and contents sprinkled on soft food (do not chew beads). Avoid dietary stimulants (eg, caffeine, tea, colas, or chocolate; may increase adverse side effects). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea, vomiting, or lose of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report acute insomnia or restlessness, chest pain or rapid heartbeat, emotional lability or agitation, muscle tremors or cramping, acute headache, abdominal pain and cramping, blackened stool, or worsening of respiratory condition. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

TheoCap™: 125 mg, 200 mg [12 hour]

Theo-24®: 100 mg, 200 mg, 300 mg, 400 mg [24 hours]

Elixir:

Elixophyllin®: 80 mg/15 mL (473 mL) [contains alcohol 20%; mixed fruit flavor]

Infusion [premixed in D_5W]: 200 mg (50 mL, 100 mL); 400 mg (250 mL, 500 mL); 800 mg (250 mL, 500 mL, 1000 mL)

Tablet, controlled release:

Uniphyl®: 400 mg, 600 mg [24 hours]

Tablet, extended release: 100 mg, 200 mg, 300 mg, 400 mg, 450 mg, 600 mg

Theochron™: 100 mg, 200 mg, 300 mg, 450 mg [12-24 hours]

Generic AvailableYes: Extended release capsule and tablet, infusion

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Theophylline CR)

125 mg (60): $43.57

200 mg (60): $29.99

300 mg (60): $49.99

Capsule, 24-hour (Theo-24)

100 mg (60): $34.97

200 mg (60): $55.99

300 mg (60): $69.95

400 mg (60): $89.99

Elixir (Elixophyllin)

80 mg/15 mL (480): $97.01

Tablet, 12-hour (Theophylline CR)

100 mg (60): $17.99

200 mg (60): $23.74

300 mg (60): $18.99

450 mg (60): $41.99

Tablet, 24-hour (Uniphyl)

400 mg (60): $80.99

600 mg (60): $114.80

Mechanism of ActionCauses bronchodilatation, diuresis, CNS and cardiac stimulation, and gastric acid secretion by blocking phosphodiesterase which increases tissue concentrations of cyclic adenine monophosphate (cAMP) which in turn promotes catecholamine stimulation of lipolysis, glycogenolysis, and gluconeogenesis and induces release of epinephrine from adrenal medulla cells

Pharmacodynamics/Kinetics

Absorption: Oral: Dosage form dependent

Distribution: 0.45 L/kg based on ideal body weight; distributes poorly into body fat; V_d may increase in premature neonates, patients with hepatic cirrhosis, acidemia (uncorrected), the elderly

Metabolism: Children >1 year and Adults: Hepatic; involves CYP1A2, 2E1 and 3A4; forms active metabolites (caffeine and 3-methylxanthine)

Protein binding: 40%, primarily to albumin

Half-life elimination: Highly variable and dependent upon age, liver function, cardiac function, lung disease, and smoking history

Premature infants, postnatal age 3-15 days: 30 hours (range: 17-43 hours)

Premature infants, postnatal age 25-57 days: 20 hours (range: 9.4-30.6 hours)

Children 6-17 years: 3.7 hours (range: 1.5-5.9 hours)

Adults 16-60 years with asthma, nonsmoking, otherwise healthy: 8.7 hours (range: 6.1-12.8 hours)

Time to peak, serum:

Oral: Liquid: 1 hour; Tablet, enteric-coated: 5 hours; Tablet, uncoated: 2 hours

I.V.: Within 30 minutes

Excretion: Urine

Neonates: 50% as unchanged theophylline

Children >3 months and Adults: ~10% as unchanged theophylline

Related Information

- Asthma

Dental Health: Effects on Dental TreatmentPrescribe erythromycin products with caution to patients taking theophylline products. Erythromycin will delay the normal metabolic inactivation of theophyllines leading to increased blood levels; this has resulted in nausea, vomiting, and CNS restlessness. Azithromycin does not cause these effects in combination with theophylline products.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness and restlessness; may rarely cause insomnia and irritability

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease serum levels while disulfiram, propranolol, and fluvoxamine may increase theophylline levels

Cardiovascular ConsiderationsTheophylline results in significant tachycardia and, at higher doses, may impair ventricular rate control in patients with atrial fibrillation. This is particularly a concern since patients with underlying chronic obstructive lung disease often have coexisting atrial fibrillation. A theophylline derivative can be used to treat patients who have adverse hemodynamic responses to adenosine or dipyridamole during cardiovascular stress testing. Theophylline has been used for neurocardiogenic (vasovagal) syncope.

Index TermsTheophylline Anhydrous

Thiabendazole

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(thye a BEN da zole)

U.S. Brand NamesMintezol®

Pharmacologic CategoryAnthelmintic

Use: Labeled IndicationsTreatment of strongyloidiasis, cutaneous larva migrans, visceral larva migrans, dracunculiasis, trichinosis, and mixed helminthic infections

Use: Unlabeled/InvestigationalCutaneous larva migrans (topical application)

Dosing: Adults**Note:** Purgation is not required prior to use; drinking of fruit juice aids in expulsion of worms by removing the mucous to which the intestinal tapeworms attach themselves.

Parasitic infections: Oral: 50 mg/kg/day divided every 12 hours; maximum: 3 g/day

Treatment duration:

Strongyloidiasis: For 2 consecutive days

Cutaneous larva migrans: For 2 consecutive days; if active lesions are still present 2 days after completion, a second course of treatment is recommended.

Visceral larva migrans: For 7 consecutive days

Trichinosis: For 2-4 consecutive days; optimal dosage not established.

Dracunculosis: 50-75 mg/kg/day divided every 12 hours for 3 days

Cutaneous larva migrans: Topical (unlabeled): Apply directly to larval tracks 2-3 times/day for up to 2 weeks; application frequencies may range from 2-6 times/day. **Note:** Not available as a topical formulation; oral suspension (10% to 15%) has been used topically, as well as a number of extemporaneous formulations.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricParasitic infections: Children: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution.

Dosing: Hepatic ImpairmentUse with caution.

Extemporaneously PreparedTopical application of thiabendazole has been recommended for the treatment of cutaneous larva migrans (*Redbook*, 2003; *Med Letter*, 2002). In some cases, the commercially-available 10% oral suspension has been used for topical application. Alternatively, a number of extemporaneous preparations have used crushed tablets to prepare distinct formulations. These include a 10% ointment (in white petrolatum), a 15% topical lotion (suspended with compound tragacanth powder 250 mg/40 mL), a 15% cream (in either hydrophilic or fat-based creams), and topical solutions (2% to 4% in DMSO). The stability of these formulations has not been established, and there are no comparative studies evaluating different formulations. All preparations have been applied between 2-6 times daily for up to 2 weeks.

ContraindicationsHypersensitivity to thiabendazole or any component of the formulation; not for use as prophylactic treatment of enterobiasis (pinworm) infestation

Allergy Considerations

- Benzimidazole Anthelmintics Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Erythema multiforme and Stevens-Johnson syndrome have been reported (including fatalities); discontinue at first sign of reaction.
- Ocular effects: Ophthalmic changes may occur and persist >1 year.

Disease-related concerns:

- Anemia: Use with caution in patients with anemia.
- *Ascaris* infections: Not suitable treatment for mixed infections with *Ascaris*.
- Dehydration: Use with caution in patients with dehydration.
- Hepatic impairment: Use with caution in patients with hepatic impairment; jaundice, cholestasis and parenchymal liver damage have occurred.

- Malnutrition: Use with caution in patients with malnutrition.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy are limited in children <14 kg (30 lb).

Pregnancy Risk FactorC

Pregnancy ConsiderationsCleft palate and skeletal defects were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Central nervous system: Chills, delirium, dizziness, drowsiness, hallucinations, headache, seizure

Dermatologic: Angioedema, pruritus, rash, Stevens-Johnson syndrome

Endocrine & metabolic: Hyperglycemia

Gastrointestinal: Abdominal pain, anorexia, diarrhea, drying of mucous membranes, nausea, vomiting

Genitourinary: Crystalluria, enuresis, hematuria, malodor of urine

Hematologic: Leukopenia

Hepatic: Cholestasis, hepatic failure, hepatotoxicity, jaundice

Neuromuscular & skeletal: Incoordination, numbness

Ocular: Abnormal sensation in eyes, blurred vision, dry eyes, Sicca syndrome, vision decreased, xanthopsia

Otic: Tinnitus

Renal: Nephrotoxicity

Miscellaneous: Anaphylaxis, hypersensitivity reactions, lymphadenopathy

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor); **Inhibits** CYP1A2 (strong)

Drug Interactions

Aminoquinolines (Antimalarial): May decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Theophylline Derivatives: Thiabendazole may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Monitoring ParametersPeriodic renal and hepatic function tests

Nursing: Physical Assessment/MonitoringWorm infestations are easily transmitted, all close family members should be treated. Instruct patient/caregiver on appropriate use, transmission prevention, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationTake exactly as directed for full course of medication. Tablets may be chewed, swallowed whole, or crushed and mixed with food. Increase dietary intake of fruit juices. All family members and close friends should also be treated. To reduce possibility of reinfection, wash hands and scrub nails carefully with soap and hot water before handling food, before eating, and before and after toileting. Keep hands out of mouth. Disinfect toilet daily and launder bed linens, undergarments, and nightclothes daily with hot water and soap. Do not go barefoot and do not sit directly on grass or ground. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or abdominal pain, nausea, dry mouth, or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report skin rash or itching, unresolved diarrhea or vomiting, CNS changes (hallucinations, delirium, acute headache), change in color of urine or stool, or easy bruising or unusual bleeding. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension, oral: 500 mg/5 mL (120 mL) [DSC]

Tablet, chewable: 500 mg [orange flavor]

Generic AvailableNo

Mechanism of ActionInhibits helminth-specific mitochondrial fumarate reductase

Pharmacodynamics/Kinetics

Absorption: Rapid and well absorbed

Metabolism: Rapidly hepatic; metabolized to 5-hydroxy form

Half-life elimination: 1.2 hours

Time to peak, plasma: Oral suspension: Within 1-2 hours

Excretion: Urine (90%) and feces (5%) primarily as conjugated metabolites

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Drying of mucous membranes.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, hallucinations, or delirium
Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine
Index TermsTiabendazole

Thiamine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Thiamine may be confused with Tenormin®, Thorazine®

International issues:

Doxal® [Brazil] may be confused with Doxil® which is a brand name for doxorubicin in the U.S.

Doxal® [Brazil]: Brand name for doxycycline in Austria; brand name for pyridoxine in Brazil; brand name for doxepin in Finland

Pronunciation(THYE a min)

Canadian Brand NamesBetaxin®

Pharmacologic CategoryVitamin, Water Soluble

Use: Labeled IndicationsTreatment of thiamine deficiency including beriberi, Wernicke's encephalopathy, Korsakoff's syndrome, neuritis associated with pregnancy, or in alcoholic patients; dietary supplement

Dosing: Adults

Recommended daily intake:

≥19 years: Female: 1.1 mg; Male: 1.2 mg

Pregnancy, lactation: 1.4 mg

Parenteral nutrition supplementation: 6 mg/day; may be increased to 25-50 mg/day with history of alcohol abuse

Thiamine deficiency (beriberi): 5-30 mg/dose I.M. or I.V. 3 times/day (if critically ill); then orally 5-30 mg/day in single or divided doses 3 times/day for 1 month

Alcohol withdrawal syndrome: 100 mg/day I.M. or I.V. for several days, followed by 50-100 mg/day orally

Wernicke's encephalopathy: Treatment: Initial: 100 mg I.V., then 50-100 mg/day I.M. or I.V. until consuming a regular, balanced diet. Larger doses may be needed in patients with alcohol abuse.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Adequate Intake:

0-6 months: 0.2 mg/day

7-12 months: 0.3 mg/day

Recommended daily intake:

1-3 years: 0.5 mg

4-8 years: 0.6 mg

9-13 years: 0.9 mg

14-18 years: Female: 1 mg; Male: 1.2 mg

≥19 years: Refer to adult dosing.

Parenteral nutrition supplementation: Infants: 1.2 mg/day

Thiamine deficiency (beriberi): Children: 10-25 mg/dose I.M. or I.V. daily (if critically ill), or 10-50 mg/dose orally every day for 2 weeks, then 5-10 mg/dose orally daily for 1 month

Administration: I.M.Parenteral form may be administered I.M.

Administration: I.V.Parenteral form may be administered by I.V. injection. Various rates of administration have been reported. Local injection reactions may be minimized by slow administration (~30 minutes) into larger, more proximal veins. Thiamine should be administered prior to parenteral glucose solutions to prevent the precipitation of heart failure.

Administration: I.V. DetailpH: 2.5-4.5

Dietary ConsiderationsDietary sources include legumes, pork, beef, whole grains, yeast, and fresh vegetables. A deficiency state can occur in as little as 3 weeks following total dietary absence.

StorageInjection: Store at 15°C to 30°C (59°F to 86°F). Protect from light.
CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, fat emulsion 10%, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Famotidine.

Compatibility in syringe: Compatible: Doxapram.

ContraindicationsHypersensitivity to thiamine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Have been reported following repeated parenteral doses; consider skin test in individuals with history of allergic reactions.

Concurrent drug therapy issues:

- Dextrose: Administration of dextrose may precipitate acute symptoms of thiamine deficiency; use caution when thiamine status is marginal or suspect.

Dosage form specific issues:

- Aluminum: Some parenteral products contain aluminum; use caution in patients with impaired renal function and neonates.

Other warnings/precautions:

- Parenteral administration: Use with caution with parenteral route (especially I.V.) of administration.

- Vitamin deficiency: Single vitamin deficiency is rare; evaluate for other deficiencies.

Geriatric ConsiderationsNo special recommendations are necessary. Elderly are treated the same as younger adults.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
Pregnancy Considerations

Thiamine requirements are increased during pregnancy. Severe nausea and vomiting (hyperemesis gravidarum) may lead to thiamine deficiency manifested as Wernicke’s encephalopathy.

LactationEnters breast milk/use caution (AAP rates “compatible”)
Adverse ReactionsAdverse reactions reported with injection. Frequency not defined.

Cardiovascular: Cyanosis

Central nervous system: Restlessness

Dermatologic: Angioneurotic edema, pruritus, urticaria

Gastrointestinal: Hemorrharge into GI tract, nausea, tightness of the throat

Local: Induration and/or tenderness at the injection site (following I.M. administration)

Neuromuscular & skeletal: Weakness

Respiratory: Pulmonary edema

Miscellaneous: Anaphylactic/hypersensitivity reactions (following I.V. administration), diaphoresis, warmth

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Ethanol: May decrease thiamine absorption.

Food: High carbohydrate diets may increase thiamine requirement.

Test InteractionsFalse-positive for uric acid using the phosphotungstate method and for urobilinogen using the Ehrlich's reagent; large doses may interfere with the spectrophotometric determination of serum theophylline concentration
Reference RangeNormal, serum: 1.1-1.6 mg/dL
Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate administration (injection technique and needle disposal if I.M. self-administered) and dietary instruction.
Patient EducationTake exactly as directed; do not discontinue without consulting prescriber (deficiency state can occur in as little as 3 weeks). Follow dietary instructions (dietary sources include legumes, pork, beef, whole grains, yeast, fresh vegetables). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 100 mg/mL (2 mL)

Tablet, as hydrochloride: 50 mg, 100 mg, 250 mg, 500 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Thiamine HCl)

100 mg (30): $5.41

Mechanism of ActionAn essential coenzyme in carbohydrate metabolism by combining with adenosine triphosphate to form thiamine pyrophosphate

Pharmacodynamics/Kinetics

Absorption: Oral: Adequate; I.M.: Rapid and complete

Distribution: Highest concentrations found in brain, heart, kidney, liver; crosses the placenta, enters breast milk

Excretion: Urine (as unchanged drug and as pyrimidine after body storage sites become saturated)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tightness of the throat.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusWeakness and restlessness have been reported with injection

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAneurine Hydrochloride; Thiamin; Thiamine Hydrochloride; Thiaminium Chloride Hydrochloride; Vitamin B_1

Thioguanine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

6-thioguanine and 6-TG are error-prone abbreviations (associated with six-fold overdoses of thioguanine)

Pronunciation(thye oh GWAH neen)
U.S. Brand NamesTabloid®
Canadian Brand NamesLanvis®
Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Purine Antagonist)
Use: Labeled IndicationsTreatment of acute myelogenous (nonlymphocytic) leukemia; treatment of chronic myelogenous leukemia and granulocytic leukemia
Dosing: AdultsTotal daily dose can be given at one time.

Antineoplastic: Oral: Refer to individual protocols: 2-3 mg/kg/day calculated to nearest 20 mg or 75-200 mg/m^2/day in 1-2 divided doses for 5-7 days or until remission is attained

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricTotal daily dose can be given at one time.

Antineoplastic: Oral (refer to individual protocols):

Infants and Children <3 years: Combination drug therapy for acute nonlymphocytic leukemia: 3.3 mg/kg/day in divided doses twice daily for 4 days

Children >3 years: Refer to adult dosing.

Dosing: Renal ImpairmentReduce dose.
Dosing: Hepatic ImpairmentReduce dose.
Dosing: Combination Regimens

Leukemia, acute myeloid:

DAT

TAD

V-TAD

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

StorageStore tablet at room temperature.
Reconstitution
Compatibility
Extemporaneously PreparedA 20 mg/mL oral suspension can be prepared by crushing fifteen 40 mg tablets in a mortar, and then adding 10 mL of methylcellulose 1% (in small amounts). Transfer to a graduate, then add a sufficient quantity of syrup to make 30 mL of suspension. Label “shake well.” Room temperature stability is 60 days.

Dressman JB and Poust RI, “Stability of Allopurinol and Five Antineoplastics in Suspension,” *Am J Hosp Pharm*, 1983, 40:616-8.

Nahata MC, Morosco RS, and Hipple TF, 4th ed, *Pediatric Drug Formulations*, Cincinnati, OH: Harvey Whitney Books Co, 2000.

RestrictionsThe I.V. formulation is not available in U.S.
ContraindicationsHypersensitivity to thioguanine or any component of the formulation; pregnancy
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Myelosuppression is a common dose-related toxicity (may be delayed); patients with genetic deficiency of thiopurine methyltransferase (TPMT) or who are receiving drugs which inhibit this enzyme (mesalazine, olsalazine, sulfasalazine) may be highly sensitive to myelosuppressive effects.

- Hepatotoxicity: Not recommended for long-term continuous therapy due to potential for hepatotoxicity (hepatic veno-occlusive disease); discontinue in patients with evidence of hepatotoxicity.

- Secondary malignancies: Thioguanine is potentially carcinogenic.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pregnancy: Thioguanine is potentially teratogenic.

Other warnings/precautions:

- Resistance: Caution with history of previous therapy resistance with either thioguanine or mercaptopurine (there is usually complete cross resistance between these two).

Pregnancy Risk FactorD
LactationExcretion in breast milk unknown
Adverse Reactions

>10%: Hematologic: Myelosuppressive:

WBC: Moderate

Platelets: Moderate

Onset: 7-10 days

Nadir: 14 days

Recovery: 21 days

1% to 10%:

Dermatologic: Skin rash

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Mild nausea or vomiting, anorexia, stomatitis, diarrhea

Neuromuscular & skeletal: Unsteady gait

<1%: Ascites, esophageal varices, hepatic necrosis, hepatitis, jaundice, LFTs increased, neurotoxicity, photosensitivity, portal hypertension, splenomegaly, thrombocytopenia, veno-occlusive hepatic disease

Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

5-ASA Derivatives: May decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Enhanced absorption if administered between meals.
Monitoring ParametersCBC with differential and platelet count; liver function tests (weekly when beginning therapy then monthly, more frequently in patients with liver disease or concurrent hepatotoxic drugs); hemoglobin, hematocrit, serum uric acid; some laboratories offer testing for TPMT deficiency

Hepatotoxicity may present with signs of portal hypertension (splenomegaly, esophageal varices, thrombocytopenia) or veno-occlusive disease (fluid retention, ascites, hepatomegaly with tenderness, or hyperbilirubinemia)

Nursing: Physical Assessment/MonitoringUse caution with renal or hepatic impairment. Assess potential for interactions with other pharmacological agents patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, myelosuppression, nausea, vomiting, malaise, rash, diarrhea) weekly when beginning therapy, then monthly. Teach patient appropriate use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count; liver function tests (weekly when beginning therapy then monthly, more frequently in patients with liver disease or concurrent hepatotoxic drugs); serum uric acid, renal function; some laboratories offer testing for TPMT deficiency

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea and vomiting, diarrhea, or loss of appetite (small, frequent meals may help/request medication); weakness or lethargy (use caution when driving or engaging in tasks requiring alertness until response to drug is known); mouth sores (use good oral care); or headache (request medication). You will be susceptible to infection (avoid crowds and exposure to infection). Report signs or symptoms of infection (eg, fever, chills, sore throat, burning urination, fatigue); bleeding (eg, tarry stools, easy bruising); vision changes; unresolved mouth sores, nausea, or vomiting; CNS changes (hallucinations); or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Do not get pregnant. Consult prescriber for appropriate contraceptive measures. The drug may cause permanent sterility and may cause birth defects. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]:

Tabloid®: 40 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Tabloid)

40 mg (25): $196.97

Mechanism of ActionPurine analog that is incorporated into DNA and RNA resulting in the blockage of synthesis and metabolism of purine nucleotides

Pharmacodynamics/Kinetics

Absorption: 30% (highly variable)

Distribution: Crosses placenta

Metabolism: Hepatic; rapidly and extensively via TPMT to 2-amino-6-methylthioguanine (active) and inactive compounds

Half-life elimination: Terminal: 11 hours

Time to peak, serum: Within 8 hours

Excretion: Urine

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; avoid clozapine and carbamazepine

Index Terms2-Amino-6-Mercaptopurine; 6-TG (error-prone abbreviation); 6-Thioguanine (error-prone abbreviation); NSC-752; TG; Tioguanine

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(thye oh PEN tal)

U.S. Brand NamesPentothal®

Canadian Brand NamesPentothal®

Pharmacologic CategoryAnticonvulsant, Barbiturate; Barbiturate; General Anesthetic

Use: Labeled IndicationsInduction of anesthesia; adjunct for intubation in head injury patients; control of convulsive states; treatment of elevated intracranial pressure

Dosing: Adults

Anesthesia: I.V.:

Induction: 3-5 mg/kg

Maintenance: 25-100 mg as needed

Increased intracranial pressure: I.V.: Children and Adults: 1.5-5 mg/kg/dose; repeat as needed to control intracranial pressure

Seizures: I.V.: 75-250 mg/dose, repeat as needed

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Anesthesia: I.V.:

Induction:

Infants: 5-8 mg/kg

Children 1-12 years: 5-6 mg/kg

Maintenance: Children: 1 mg/kg as needed

Increased intracranial pressure: I.V.: Children: 1.5-5 mg/kg/dose; repeat as needed to control intracranial pressure

Seizures: I.V.: Children: 2-3 mg/kg/dose, repeat as needed

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Administer 75% of normal dose.

Note: Accumulation may occur with chronic dosing due to lipid solubility. Prolonged recovery may result from redistribution of thiopental from fat stores.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer slowly over 20-30 seconds. Rapid I.V. injection may cause hypotension or decreased cardiac output; avoid extravasation, necrosis may occur. Check I.V. catheter placement prior to administration.

Dietary ConsiderationsSodium content of 1 g (injection): 86.8 mg (3.8 mEq)

StorageReconstituted solutions remain stable for 3 days at room temperature and 7 days when refrigerated.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5W, $^1/_2$NS, NS; **incompatible** with D_5LR, D_{10}W, D_{10}NS, LR; **variable stability (consult detailed reference)** in D_5NS.

Y-site administration: Compatible: Doxacurium, fentanyl, heparin, milrinone, mivacurium, nitroglycerin, ranitidine, remifentanil. **Incompatible:** Alfentanil, ascorbic acid, atracurium, atropine, diltiazem, dobutamine, dopamine, ephedrine, epinephrine, furosemide, hydromorphone, labetalol, lidocaine, midazolam, nicardipine, norepinephrine, pancuronium, phenylephrine, succinylcholine, sufentanil, vecuronium. **Variable (consult detailed reference):** Cisatracurium, lorazepam, morphine.

Compatibility in syringe: Compatible: Aminophylline, hyaluronidase, hydrocortisone sodium succinate, neostigmine, pancuronium, pentobarbital, propofol, scopolamine, tubocurarine. **Incompatible:** Chlorpromazine, dimenhydrinate, diphenhydramine, doxapram, ephedrine, glycopyrrolate, meperidine, morphine, pentazocine, prochlorperazine edisylate, promethazine, sodium bicarbonate.

Compatibility when admixed: Compatible: Chloramphenicol, hydrocortisone sodium succinate, oxytocin, pentobarbital, phenobarbital, potassium chloride, sodium bicarbonate. **Incompatible:** Amikacin, cimetidine, clindamycin, dimenhydrinate, diphenhydramine, droperidol, fentanyl, fibrinolysin (human), hydromorphone, insulin (regular), levorphanol, meperidine, metaraminol, morphine, norepinephrine, penicillin G potassium, prochlorperazine edisylate, promazine, promethazine, succinylcholine. **Variable (consult detailed reference):** Atracurium, ephedrine, pancuronium.

RestrictionsC-III

ContraindicationsHypersensitivity to thiopental, barbiturates, or any component of the formulation; status asthmaticus; severe cardiovascular disease; porphyria (variegate or acute intermittent); should not be administered by intra-arterial injection

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: May cause hypotension; use with caution in hemodynamically unstable patients (hypotension or shock).
- Laryngospasm/bronchospasms: May cause laryngospasm or bronchospasms; use with extreme caution in patients with reactive airway diseases (asthma or COPD).
- Paradoxical stimulatory response: May cause paradoxical responses, including agitation and hyperactivity, particularly in acute pain and pediatric patients.
- Respiratory depression: May cause respiratory depression; use with caution patients with respiratory disease.

Disease-related concerns:

- Addison's disease: Use with caution in patients with Addison's disease; may prolong or potentiate hypnotic effect.
- Anemia: Use with caution in patients with severe anemia; may prolong or potentiate hypnotic effect.
- Aneurysms: Use with caution in patients with unstable aneurysms.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may prolong or potentiate hypnotic effect.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may prolong or potentiate hypnotic effect.
- Myxedema: Use with caution in patients with myxedema; may prolong or potentiate hypnotic effect.
- Renal impairment: Use with caution in patients with renal impairment; may prolong or potentiate hypnotic effect.
- Substance abuse: Use with caution in patients with a history of drug abuse; potential for drug dependency exists.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in patients who are debilitated.
- Elderly: Use with caution in the elderly.
- Excessively premedicated patients: Use with caution in patients excessively premedicated; may prolong or potentiate hypnotic effect.
- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Acute pain: Do not administer to patients in acute pain.
- Cumulative effect: Repeated dosing or continuous infusions may cause cumulative effects.
- Intravenous access: Ensure patient has intravenous access; extravasation or intra-arterial injection causes necrosis due to pH of 10.6.
- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypotension, syncope

Central nervous system: Drowsiness, lethargy, CNS excitation or depression, impaired judgment, “hangover” effect, confusion, somnolence, agitation, hyperkinesia, ataxia, nervousness, headache, insomnia, nightmares, hallucinations, anxiety, dizziness, shivering

Dermatologic: Rash, exfoliative dermatitis, Stevens-Johnson syndrome

Gastrointestinal: Nausea, vomiting, constipation

Hematologic: Agranulocytosis, thrombocytopenia, megaloblastic anemia, immune hemolytic anemia (rare)

Local: Pain at injection site, thrombophlebitis with I.V. use

Renal: Oliguria

Respiratory: Laryngospasm, respiratory depression, apnea (especially with rapid I.V. use), hypoventilation, sneezing, cough, bronchospasm

Miscellaneous: Gangrene with inadvertent intra-arterial injection, anaphylaxis, anaphylactic reactions

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersRespiratory rate, heart rate, blood pressure

Reference RangeTherapeutic: Hypnotic: 1-5 mcg/mL (SI: 4.1-20.7 µmol/L); Coma: 30-100 mcg/mL (SI: 124-413 µmol/L); Anesthesia: 7-130 mcg/mL (SI: 29-536 µmol/L); Toxic: >10 mcg/mL (SI: >41 µmol/L)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Periodically evaluate the need for continued use. I.V.: Keep patient under observation. Monitor cardio/respiratory status and institute patient safety precautions. Monitor effectiveness of therapy and adverse reactions. Respiratory status (for conscious sedation, includes pulse oximetry), cardiovascular status, CNS status (when used for procedures monitor sedation score); cardiac monitor and blood pressure monitor required. Infusion site should be monitored closely to prevent extravasation (see Administration).

Patient EducationResidual sedation following recovery is normal, due to slow release of the drug from lipid depots; patients should not drive or engage in similarly dangerous activities until at least the following day

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium: 250 mg, 400 mg, 500 mg, 1 g

Generic AvailableNo

Mechanism of ActionShort-acting barbiturate with sedative, hypnotic, and anticonvulsant properties. Barbiturates depress the sensory cortex, decrease motor activity, alter cerebellar function, and produce drowsiness, sedation, and hypnosis. In high doses, barbiturates exhibit anticonvulsant activity; barbiturates produce dose-dependent respiratory depression.

Pharmacodynamics/Kinetics

Onset of action: Anesthetic: I.V.: 30-60 seconds

Duration: 5-30 minutes

Distribution: V_d: ~1.6 L/kg

Protein binding: 72% to 86%

Metabolism: Hepatic, primarily to inactive metabolites but pentobarbital is also formed

Half-life elimination: 3-11.5 hours; decreased in children

Pharmacotherapy PearlsThiopental switches from linear to nonlinear pharmacokinetics following prolonged continuous infusions.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Anesthesia and Critical Care Concerns/Other ConsiderationsThiopental switches from linear to nonlinear pharmacokinetics following prolonged continuous infusions.

Index TermsThiopental Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Thioridazine may be confused with thiothixene, Thorazine®

Mellaril® may be confused with Elavil®, Mebaral®

Pronunciation(thye oh RID a zeen)

Canadian Brand NamesMellaril®

Pharmacologic CategoryAntipsychotic Agent, Typical, Phenothiazine

Use: Labeled IndicationsManagement of schizophrenic patients who fail to respond adequately to treatment with other antipsychotic drugs, either because of insufficient effectiveness or the inability to achieve an effective dose due to intolerable adverse effects from those medications

Use: Unlabeled/InvestigationalBehavior problems (children); severe psychoses (children); schizophrenia/psychoses (children); depressive disorders/dementia (children and adults); behavioral symptoms associated with dementia (elderly); psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Schizophrenia/psychosis: Oral: Initial: 50-100 mg 3 times/day with gradual increments as needed and tolerated; maximum: 800 mg/day in 2-4 divided doses

Depressive disorders, dementia (unlabeled use): Oral: Initial: 25 mg 3 times/day; maintenance dose: 20-200 mg/day

Dosing: ElderlyBehavioral symptoms associated with dementia (unlabeled use): Oral: Initial: 10-25 mg 1-2 times/day; increase at 4- to 7-day intervals by 10-25 mg/day; increase dose intervals (once daily, twice daily, etc) as necessary to control response or side effects. Maximum daily dose: 400 mg; gradual increases (titration) may prevent some side effects or decrease their severity.

Dosing: Pediatric

Schizophrenia/psychosis (unlabeled use): Oral:

Children >2-12 years: Range: 0.5-3 mg/kg/day in 2-3 divided doses; usual: 1 mg/kg/day; maximum: 3 mg/kg/day

Children >12 years: Refer to adult dosing.

Behavior problems (unlabeled use): Oral:

Children >2-12 years: Initial: 10 mg 2-3 times/day, increase gradually.

Children >12 years: Refer to adult dosing.

Severe psychoses (unlabeled use): Oral:

Children >2-12 years: Initial: 25 mg 2-3 times/day, increase gradually.

Children >12 years: Refer to adult dosing.

Dosing: Renal ImpairmentNot dialyzable (0% to 5%)

Administration: Oral Do not take antacid within 2 hours of taking drug.

StorageProtect from light.

ContraindicationsHypersensitivity to thioridazine or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; circulatory collapse; severe hypotension; bone marrow suppression; blood dyscrasias; coma; in combination with other drugs that are known to prolong the QT_c interval; in patients with congenital long QT syndrome or a history of cardiac arrhythmias; concurrent use with medications that inhibit the metabolism of thioridazine (fluoxetine, paroxetine, fluvoxamine, propranolol, pindolol); patients known to have genetic defect leading to reduced levels of activity of CYP2D6

Warnings/Precautions

Boxed warnings:

- Altered cardiac conduction: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Altered cardiac conduction: **[U.S. Boxed Warning]: Has dose-related effects on ventricular repolarization leading to QT_c prolongation, a potentially life-threatening effect.** Therefore, it should be reserved for patients with schizophrenia who have failed to respond to adequate levels of other antipsychotic drugs.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, thioridazine has a high potency of cholinergic blockade.

- Blood dyscrasias: Check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is low relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: Highly sedating which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Thioridazine is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.
- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

In the treatment of agitated, demented, older adult patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: ECG changes, hypotension, orthostatic hypotension, peripheral edema

Central nervous system: Akathisia, dizziness, drowsiness; EPS (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia); impairment of temperature regulation, lowering of seizure threshold, neuroleptic malignant syndrome (NMS), seizure

Dermatologic: Increased sensitivity to sun, rash, discoloration of skin (blue-gray)

Endocrine & metabolic: Amenorrhea, breast pain, galactorrhea, libido (changes in), menstrual cycle (changes in)

Gastrointestinal: Constipation, diarrhea, nausea, stomach pain, vomiting, weight gain, xerostomia

Genitourinary: Difficulty in urination, ejaculatory disturbances, urinary retention, priapism

Hematologic: Agranulocytosis, leukopenia

Hepatic: Cholestatic jaundice, hepatotoxicity

Neuromuscular & skeletal: Tremor

Ocular: Blurred vision, cornea and lens changes, pigmentary retinopathy

Respiratory: Nasal congestion

Metabolism/Transport Effects**Substrate** of CYP2C19 (minor), 2D6 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2D6 (moderate), 2E1 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors: May decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fluvoxamine: May increase the serum concentration of Thioridazine. *Risk X: Avoid combination*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, valerian, St John's wort, gotu kola (may increase CNS depression). Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsFalse-positives for phenylketonuria, urinary amylase, uroporphyrins, urobilinogen

Monitoring ParametersBaseline and periodic ECG; vital signs; serum potassium, lipid profile, fasting blood glucose and Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS); periodic eye exam; do not initiate if QT_c >450 msec

Reference RangeToxic: >1 mg/mL; lethal: 2-8 mg/dL

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Review ophthalmic exam and monitor laboratory results, therapeutic effectiveness (mental status, mood, affect, gait), and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for CNS depression/level of sedation. Avoid skin contact with liquid medication; may cause contact dermatitis (wash immediately with warm, soapy water). Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsBaseline ECG; serum potassium, lipid profile, fasting blood glucose and Hgb A_{1c}; BMI; do not initiate if QT_c >450 msec

Patient EducationUse exactly as directed; do not increase dose or frequency. Do not discontinue without consulting prescriber. Tablet may be taken with food. Mix oral solution with 2-4 oz of liquid (eg, juice, milk, water, pudding). Do not take within 2 hours of any antacid. Store away from light. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid skin contact with liquid medication; may cause contact dermatitis (wash immediately with warm, soapy water). May turn urine red-brown (normal). You may experience excess drowsiness, lightheadedness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); ejaculatory dysfunction (reversible); decreased perspiration (avoid strenuous exercise in hot environments); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; altered menstrual pattern, change in libido, swelling or pain in breasts (male or female); vision changes; skin rash, irritation, or changes in color of skin (gray-blue); or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as hydrochloride: 10 mg, 15 mg [DSC], 25 mg, 50 mg, 100 mg, 150 mg [DSC], 200 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Thioridazine HCl)

10 mg (90): $21.99

15 mg (90): $11.99

25 mg (90): $25.97

50 mg (90): $29.99

100 mg (90): $34.99

150 mg (90): $57.99

200 mg (90): $81.99

Mechanism of ActionThioridazine is a piperidine phenothiazine which blocks postsynaptic mesolimbic dopaminergic receptors in the brain; exhibits a strong alpha-adrenergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones

Pharmacodynamics/Kinetics

Duration: 4-5 days

Half-life elimination: 21-25 hours

Time to peak, serum: ~1 hour

- Liquid Compatibility

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension.

Tardive dyskinesia; Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure. Thioridazine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health CommentThioridazine is a low-potency antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Thioridazine has a black-box warning for prolongation of QT_c interval.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(thye oh TEP a)

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled IndicationsTreatment of superficial tumors of the bladder; palliative treatment of adenocarcinoma of breast or ovary; lymphomas and sarcomas; controlling intracavitary effusions caused by metastatic tumors; I.T. use: CNS leukemia/lymphoma, CNS metastases

Dosing: AdultsRefer to individual protocols.

Usual dose (range):

I.M., I.V., SubQ: 30-60 mg/m^2 once weekly

I.V.: 0.3-0.4 mg/kg by rapid I.V. administration every 1-4 weeks, **or** 0.2 mg/kg or 6-8 mg/m^2/day for 4-5 days every 2-4 weeks

I.M.: 15-30 mg in various schedules have been given

Intracavitary: 0.6-0.8 mg/kg or 30-60 mg weekly

Intrapericardial: 15-30 mg

Intrathecal: 10-15 mg or 5-11.5 mg/m^2

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. Children: Sarcomas: I.V.: 25-65 mg/m^2 as a single dose every 21 days.

Dosing: Renal ImpairmentUse with extreme caution, reduced dose may be warranted.

Dosing: Combination Regimens

Breast cancer: VATH

Leukemia, acute lymphocytic: TVTG

Leukemia, acute myeloid: TVTG

Oncology: Bone Marrow - High DoseI.V.: 360-1125 mg/m^2 as a single dose or divided into 2 daily doses; generally combined with other high-dose chemotherapeutic drugs.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Administer either as a short (10-60 minute) infusion or 1-2 minute push; a 1 mg/mL solution is considered isotonic; not a vesicant

Administration: I.V. DetailA 1 mg/mL solution is considered isotonic; not a vesicant.

pH: 5.5-7.5

Administration: OtherIntravesical lavage: Instill directly into the bladder and retain for at least 2 hours; patient should be repositioned every 15-30 minutes for maximal exposure

StorageStore intact vials under refrigeration (2°C to 8°C). Protect from light. Reconstituted solutions (10 mg/mL) are stable for up to 28 days under refrigeration (4°C to 8°C) or 7 days at room temperature (25°C).

Solutions for infusion in D$_5$W (≥5 mg/mL) are stable for 14 days under refrigeration (4°C) or 3 days at room temperature (23°C).

Solutions for infusion in NS (1, 3, or 5 mg/mL) are stable for 48 hours under refrigeration (4°C to 8°C) or 24 hours at room temperature (25°C). Solutions in NS at a concentration ≤0.5 mg/mL are stable for <1 hour.

ReconstitutionReconstitute each vial to 10 mg/mL. Solutions for infusion should be diluted to a concentration ≥5 mg/mL in 5% dextrose or 1, 3, or 5 mg/mL in 0.9% sodium chloride injection. Solutions for intravesicular administration should be diluted in 30-60 mL SWFI or NS. Solutions for intrathecal administration should be diluted in 1-5 mL NS or Elliott's B solution. Filter through a 0.22 micron filter prior to administration.

Compatibility**Variable stability (consult detailed reference)** in D$_5$W, NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amikacin, aminophylline, amphotericin B, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine,dobutamine, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, , mitomycin, mitoxantrone, morphine, nalbuphine, netilmicin, ofloxacin, ondansetron, paclitaxel, piperacillin, piperacillin/tazobactam, plicamycin, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, zidovudine. **Incompatible:** Cisplatin, filgrastim, minocycline, vinorelbine. **Variable (consult detailed reference):** TPN.

Compatibility when admixed: Compatible: Epinephrine, lidocaine. **Incompatible:** Cisplatin.

ContraindicationsHypersensitivity to thiotepa or any component of the formulation; pregnancy

Allergy Considerations

- Nitrogen Mustard Allergy

Warnings/Precautions

Special handling:

• Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

• Fertility effects: May be mutagenic and teratogenic.

• Myelosuppression: Commonly with use, myelosuppression may occur; use with caution in patients with bone marrow damage, dosage reduction recommended.

• Secondary malignancies: Potentially carcinogenic; myelodysplastic syndromes and acute leukemias have been reported.

Disease-related concerns:

• Hepatic impairment: Use with caution in patients with hepatic impairment; dosage reduction recommended. Use should be limited to cases where benefit outweighs risk.

• Renal impairment: Use with caution in patients with renal impairment; dosage reduction recommended. Use should be limited to cases where benefit outweighs risk.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women. May cause harm if administered during pregnancy. Effective contraception is recommended for men and women of childbearing potential.

LactationEnters breast milk/not recommended

Adverse Reactions

>10%:

Hematopoietic: Dose-limiting toxicity which is dose related and cumulative; moderate to severe leukopenia and severe thrombocytopenia have occurred. Anemia and pancytopenia may become fatal, so careful hematologic monitoring is required; intravesical administration may cause bone marrow suppression as well.

Hematologic: Myelosuppression (WBC: moderate; platelets: severe; onset: 7-10 days, nadir: 14 days, recovery: 28 days)

Local: Injection site pain

1% to 10%:

Central nervous system: Dizziness, fatigue, fever, headache

Dermatologic: Alopecia, depigmentation (with topical treatment), hyperpigmentation (with high-dose therapy), pruritus, rash, urticaria

Endocrine & metabolic: Amenorrhea, hyperuricemia

Gastrointestinal: Anorexia, nausea and vomiting rarely occur

Emetic potential: Low (<10%)

Genitourinary: Dysuria, hemorrhagic cystitis (intravesicular administration: rare), urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Conjunctivitis

Renal: Hematuria

Miscellaneous: Tightness of the throat, allergic reactions

<1%: Stomatitis, anaphylaxis; like other alkylating agents, this drug is carcinogenic

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Oncology: Bone Marrow - Unique Toxicity

Central nervous system: Effect increased with doses >1000 mg/m^2: Confusion, inappropriate behavior, somnolence

Dermatologic: Hyperpigmentation (most common on occluded areas of skin)

Gastrointestinal: Mucositis, mild nausea and vomiting

Hepatic: Serum transaminitis, hyperbilirubinemia

Metabolism/Transport Effects**Inhibits** CYP2B6 (strong)
Drug Interactions

CYP2B6 Substrates: CYP2B6 Inhibitors (Strong) may decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Herb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersCBC with differential and platelet count (monitor for at least 3 weeks after treatment); uric acid, urinalysis
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological or herbal agents patient may be taking. See Administration for infusion specifics. Evaluate results of laboratory tests closely (eg, anemia and pancytopenia can become fatal). Assess therapeutic effectiveness and adverse response on a regular basis (eg, myelosuppression, leukopenia, dysuria, hematuria). Teach patient possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelet count (monitor for at least 3 weeks after treatment); uric acid, urinalysis
Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber (especially aspirin or aspirin-containing products). If administered by infusion, report immediately any redness, pain, swelling, or burning at infusion site. You will require regular blood tests to assess response to therapy. Maintain adequate hydration to prevent kidney damage (2-3 L/day of fluids unless instructed to restrict fluid intake). You may have increased sensitivity to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause mild nausea, vomiting, or loss of appetite (small frequent meals, chewing gum, or sucking lozenges may help); rash; hair loss; or change in skin color (usually reversible after discontinuing treatment). Report any changes in urinary pattern or blood in your urine; unusual bleeding or bruising; persistent fever or chills; sore throat; sores in mouth or vagina; blackened stool; unusual or persistent weakness; difficulty swallowing; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant (females) or cause a pregnancy (males) during therapy and for 1 month following completion of therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 15 mg, 30 mg

Generic AvailableYes
Mechanism of ActionAlkylating agent that reacts with DNA phosphate groups to produce cross-linking of DNA strands leading to inhibition of DNA, RNA, and protein synthesis; mechanism of action has not been explored as thoroughly as the other alkylating agents, it is presumed that the aziridine rings open and react as nitrogen mustard; reactivity is enhanced at a lower pH
Pharmacodynamics/Kinetics

Absorption: Intracavitary instillation: Unreliable (10% to 100%) through bladder mucosa; I.M.: variable

Metabolism: Extensively hepatic; major metabolite (active): TEPA

Half-life elimination: Terminal (dose-dependent clearance): 109 minutes

Excretion: Urine (as metabolites and unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsA 1 mg/mL solution is considered isotonic.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; avoid clozapine and carbamazepine; barbiturates may

increase clearance of thiotepa

Oncology: Bone Marrow CommentsAdministration of thiotepa over 30 minutes, 1 hour before infusion of cyclophosphamide over 60 minutes, reduced bioactivation of cyclophosphamide to 4-hydroxycyclophosphamide in 20 patients. This effect did not occur with administration of thiotepa 1 hour following infusion of cyclophosphamide.

Index TermsTESPA; Thiophosphoramide; Triethylenethiophosphoramide; TSPA

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Medication Safety Issues

Sound-alike/look-alike issues:

Thiothixene may be confused with thioridazine

Navane® may be confused with Norvasc®, Nubain®

Pronunciation(thye oh THIKS een)

U.S. Brand NamesNavane®

Canadian Brand NamesNavane®

Pharmacologic CategoryAntipsychotic Agent, Typical

Use: Labeled IndicationsManagement of schizophrenia

Use: Unlabeled/InvestigationalPsychotic disorders (children); rapid tranquilization of the agitated patient (children); nonpsychotic patient, dementia behavior (elderly); psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Mild to moderate psychosis: Oral: 2 mg 3 times/day, up to 20-30 mg/day; more severe psychosis: Initial: 5 mg 2 times/day, may increase gradually, if necessary; maximum: 60 mg/day

Rapid tranquilization of the agitated patient (administered every 30-60 minutes): Oral: 5-10 mg; average total dose for tranquilization: 15-30 mg

Dosing: ElderlyNonpsychotic patient, dementia behavior (unlabeled use): Initial: 1-2 mg 1-2 times/day; increase dose at 4- to 7-day intervals by 1-2 mg/day. Increase dosing intervals (bid, tid, etc) as necessary to control response or side effects; maximum daily dose: 30 mg. Gradual increases in dose may prevent some side effects or decrease their severity.

Dosing: Pediatric

Children <12 years (unlabeled use): Oral: 0.25 mg/kg/24 hours in divided doses (dose not well established; use not recommended)

Children >12 years (unlabeled use): Mild to moderate psychosis: Refer to adult dosing.

Dosing: Renal ImpairmentNot dialyzable (0% to 5%)

ContraindicationsHypersensitivity to thiothixene or any component of the formulation; severe CNS depression; circulatory collapse; blood dyscrasias; coma

Allergy Considerations

- Thioxanthene Allergy

Warnings/Precautions

Boxed warnings:

- Dementia: See "Disease-related concerns" below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Avoid use in patients with underlying QT prolongation, in those taking medicines that prolong the QT interval, or cause polymorphic ventricular tachycardia; monitor ECG closely for dose-related QT effects.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, thiothixene has a low potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms: May cause extrapyramidal symptoms (EPS), including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antispychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Thiothixene is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, nonspecific ECG changes, syncope, tachycardia

Central nervous system: Agitation, dizziness, drowsiness, extrapyramidal symptoms (akathisia, dystonias, lightheadedness, pseudoparkinsonism, tardive dyskinesia), insomnia restlessness

Dermatologic: Discoloration of skin (blue-gray), photosensitivity, pruritus, rash, urticaria

Endocrine & metabolic: Amenorrhea, breast pain, libido (changes in), changes in menstrual cycle, galactorrhea, gynecomastia, hyper-/hypoglycemia, hyperprolactinemia, lactation

Gastrointestinal: Constipation, nausea, salivation increased, stomach pain, vomiting, weight gain, xerostomia

Genitourinary: Difficulty in urination, ejaculatory disturbances, impotence

Hematologic: Leukocytes, leukopenia

Neuromuscular & skeletal: Tremors

Ocular: Blurred vision, pigmentary retinopathy

Respiratory: Nasal congestion

Miscellaneous: Diaphoresis

Metabolism/Transport Effects**Substrate** of CYP1A2 (major); **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, valerian, St John's wort, gotu kola (may increase CNS depression).

Test InteractionsMay cause false-positive pregnancy test

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Review ophthalmic exam and monitor laboratory results, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Avoid skin contact with liquid medication; may cause contact dermatitis (wash immediately with warm, soapy water). Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. Do not discontinue without consulting prescriber. Capsules may be taken with food. Do not take within 2 hours of any antacid. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May turn urine red-brown (normal). You may experience excess drowsiness, lightheadedness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); ejaculatory dysfunction (reversible); decreased perspiration (avoid strenuous exercise in hot environments); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; altered menstrual pattern, change in libido, swelling or pain in breasts (male or female); vision changes; skin rash, irritation, or changes in color of skin (gray-blue); or worsening of condition.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: 1 mg, 2 mg, 5 mg, 10 mg

Navane®: 1 mg [DSC], 2 mg, 5 mg, 10 mg, 20 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Navane)

2 mg (90): $84.10

5 mg (90): $131.30

10 mg (90): $175.61

20 mg (90): $243.49

Capsules (Thiothixene)

1 mg (90): $22.99

2 mg (90): $26.99

5 mg (90): $25.99

10 mg (90): $49.99

10 mg (100): $31.99

Mechanism of ActionThiothixene is a thioxanthene antipsychotic which elicits antipsychotic activity by postsynaptic blockade of CNS dopamine receptors resulting in inhibition of dopamine-mediated effects; also has alpha-adrenergic blocking activity

Pharmacodynamics/Kinetics

Metabolism: Extensively hepatic

Half-life elimination: >24 hours with chronic use

Related Information

- Antipsychotic Agents
- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Liquid Compatibility
- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure. Thiothixene is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Child/Adolescent ConsiderationsThe use of thiothixene in children <12 years of age is not recommended; safety and efficacy have not been established for this age group.

Mental Health CommentThiothixene is a high-potency antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsCoadministration of two or more antipsychotics does not improve clinical response and may increase the potential for adverse effects.

Index TermsTiotixene

Medication Safety Issues

Administration: For topical use only. Do not administer intravenously or intra-arterially.

To reduce the risk of intravascular administration, the Institute for Safe Medication Practices (ISMP) has the following recommendations:

- Prepare, label, and dispense topical thrombin from the pharmacy department (including doses used in the operating room).
- Do not leave vial or syringe at bedside.
- Add auxiliary label to all labels and syringes stating “For topical use only-do not inject”.
- When appropriate, use solutions which can be applied with an absorbable gelatin sponge or use a dry form on oozing surfaces.
- When appropriate, use spray kits to help differentiate between parenteral products.

Pronunciation(THROM bin, TOP i kal)

U.S. Brand NamesEvithrom™; Recothrom™; Thrombin-JMI®; Thrombin-JMI® Epistaxis Kit; Thrombin-JMI® Spray Kit; Thrombin-JMI® Syringe Spray Kit

Pharmacologic CategoryHemostatic Agent

Use: Labeled IndicationsHemostasis whenever minor bleeding from capillaries and small venules is accessible

Use: DentalHemostasis whenever minor bleeding from capillaries and small venules is accessible

Dosing: Adults**Bleeding:Note:** For topical use only; do not administer intravenously or intra-arterially.

Evithrom™: Dose depends on area to be treated; up to 10 mL was used with absorbable gelatin sponge in clinical studies

Recothrom™: Dose depends on area to be treated

Thrombin-JMI®:

Solution: Use 1000-2000 units/mL of solution where bleeding is profuse; use 100 units/mL for bleeding from skin or mucosal surfaces

Powder: May apply powder directly to the site of bleeding or on oozing surfaces

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: TopicalFor topical use only; do not administer intravenously or intra-arterially.

Evithrom™: Must be thawed prior to use. May thaw in refrigerator (1 day) or at room temperature (1 hour). The 2 mL and 5 mL vials may also be thawed at 37°C (98.6˚F) for up to 10 minutes.

Thrombin-JMI®: May be applied directly as a powder or as reconstituted solution; sponge surface free of blood prior to application, if possible.

Storage

Evithrom™: Store frozen at -18°C or colder; unopened vials may also be stored under refrigeration at 2°C to 8°C (36°F to 46°F) for up to 30 days. Stable for up to 24 hours at room temperature. Do not refreeze if thawed; do not refrigerate once at room temperature. Discard unused portion after 24 hours at room temperature.

Recothrom™: Store at 2°C to 25°C (36°F to 77°F). Following reconstitution, may store at this temperature for up to 24 hours.

Thrombin-JMI®: Store at 2°C to 25°C (36°F to 77°F). Solutions may be stored at 2°C to 8°C (36°F to 46°F) for up to 24 hours or at room temperature for up to 8 hours

Reconstitution

Recothrom™: Reconstitute using diluent provided in prefilled syringe. Gently swirl to dissolve powder; avoid excessive agitation. Do not use diluent syringe to withdraw solution from vial.

Thrombin-JMI®: Reconstitute using sodium chloride 0.9%.

ContraindicationsHypersensitivity to thrombin or any component of the formulation; not for direct injection into the circulatory system (for topical use only); additionally,

Evithrom™ and Recothrom™ are also contraindicated for the treatment of severe or brisk arterial bleeding.

Evithrom™ is also contraindicated in patients with known anaphylactic or severe systemic reactions to blood products.

Recotrhom™ is also contraindicated in patients with hypersensitivity to hamster proteins.

Thrombin-JMI® is also contraindicated in patients with hypersensitivity to material of bovine origin.

Warnings/Precautions

Boxed warnings:

- Abnormal hemostasis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Abnormal hemostasis: **[U.S. Boxed Warning]: Bovine-source topical thrombin (Thrombin-JMI®) may be associated with abnormal hemostasis, ranging from asymptomatic laboratory alterations to severe bleeding and/or thrombosis.** Abnormalities appear to be immunologically mediated; repeated applications increase risk. Consult expert in coagulation disorders if laboratory evidence and/or signs and symptoms of bleeding are noted. Re-exposure of patients who develop antibodies to bovine thrombin preparations should be avoided.

Dosage form specific issues:

- Evithrom™: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

- Recothrom™: Use caution in patients with known hypersensitivity to snake proteins; the potential for allergic reaction exists.

Other warnings/precautions:

- Administration: For topical use only. Do not inject intravenously or intra-arterially. Intravascular clotting, possibly leading to death, may occur following injection. May be used in combination with absorbable gelatin sponges.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdequate reproduction studies have not been conducted. Reproduction studies conducted with the solvent/detergent used in processing the human-derived product showed adverse events in animals. Only residual levels of the solvent/detergent would be expected to remain in the finished product.

Adverse ReactionsFrequency not defined.

Dermatologic: Pruritus

Gastrointestinal: Nausea, vomiting

Hematologic: Bleeding, aPTT increased, INR increased, lymphocyte count decreased, neutrophil count increased, PT prolonged

Local: Incision site complication

Miscellaneous: Antibody development, hypersensitivity reactions

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for reconstitution, topical [bovine derived]:

Thrombin-JMI®: 5000 int. units, 20,000 int. units

Thrombin-JMI® Epistaxis kit: 5000 int. units

Thrombin-JMI® Spray Kit: 20,000 int. units

Thrombin-JMI® Syringe Spray Kit: 20,000 int. units

Powder for reconstitution, topical [preservative free; recombinant]:

Recothrom™: 5000 int. units; 20,000 int. units

Solution, topical [human derived]:

Evithrom™: 800-1200 int. units/mL (2 mL, 5 mL, 20 mL)

Generic AvailableNo

Mechanism of ActionActivates platelets and catalyzes the conversion of fibrinogen to fibrin to promote hemostasis.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesThrombostat (NZ); Trombine (NL)

Thyroid, Desiccated

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(THYE roid DES i kay tid)

U.S. Brand NamesArmour® Thyroid; Nature-Throid™; Westhroid™

Pharmacologic CategoryThyroid Product

Use: Labeled IndicationsReplacement or supplemental therapy in hypothyroidism; pituitary TSH suppressants (thyroid nodules, thyroiditis, multinodular goiter, thyroid cancer), thyrotoxicosis, diagnostic suppression tests

Dosing: Adults**Hypothyroidism:** Oral: Initial: 15-30 mg; increase with 15 mg increments every 2-4 weeks; use 15 mg in patients with cardiovascular disease or myxedema. Maintenance dose: Usually 60-120 mg/day; monitor TSH and clinical symptoms.

Note: Thyroid cancer requires larger amounts than replacement therapy.

Dosing: ElderlyNot recommended for use in the elderly (see Geriatric Considerations).

Dosing: PediatricHypothyroidism: Oral: See table.

Recommended Pediatric Dosage for Congenital Hypothyroidism

Age	**Daily Dose (mg)**	**Daily Dose/kg (mg)**
0-6 mo	15-30	4.8-6
6-12 mo	30-45	3.6-4.8
1-5 y	45-60	3-3.6
6-12 y	60-90	2.4-3
>12 y	>90	1.2-1.8

Dietary ConsiderationsShould be taken on an empty stomach.

ContraindicationsHypersensitivity to beef or pork or any component of the formulation; recent myocardial infarction; thyrotoxicosis uncomplicated by hypothyroidism; uncorrected adrenal insufficiency

Warnings/Precautions

Boxed warnings:

- Weight reduction: See “Other warnings/precautions” below.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency; symptoms may be exaggerated or aggravated.
- Cardiovascular disease: Use with caution and reduce dosage in patients with angina pectoris or other cardiovascular disease; chronic hypothyroidism predisposes patients to coronary artery disease.
- Diabetes: Use with caution in patients with diabetes mellitus and insipidus; symptoms may be exaggerated or aggravated.
- Myxedema: Use with caution in patients with myxedema; symptoms may be exaggerated or aggravated.

Special populations:

- Elderly: Use with caution in the elderly; they may be more likely to have compromised cardiovascular function. Avoid use of desiccated thyroid; in the minds of many clinicians, drug of choice is levothyroxine.

Dosage form specific issues:

- Desiccated thyroid: Contains variable amounts of T_3, T_4, and other triiodothyronine compounds which are more likely to cause cardiac signs or symptoms due to fluctuating levels.

Other warnings/precautions:

- Weight reduction: **[U.S. Boxed Warning]: Thyroid supplements are ineffective and potentially toxic for weight reduction. High doses may produce serious or even life-threatening toxic effects particularly when used with some anorectic drugs.**

Geriatric ConsiderationsDesiccated thyroid contains variable amounts of T_3, T_4, and other triiodothyronine compounds which are more likely to cause cardiac signs or symptoms due to fluctuating levels. Should avoid use in the elderly for this reason. Many clinicians consider levothyroxine to be the drug of choice.

Pregnancy Risk FactorA

LactationEnters breast milk/compatible

Adverse Reactions<1%: Abdominal cramps, alopecia, ataxia, cardiac arrhythmia, changes in menstrual cycle, chest pain, constipation, diaphoresis, diarrhea, dyspnea, excessive bone loss with overtreatment (excess thyroid replacement), fever, hand tremor, headache, heat intolerance, increased appetite, insomnia, myalgia, nervousness, palpitation, tachycardia, tremor, vomiting, weight loss

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Estrogen Derivatives: May diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Thyroid Products. Phenytoin may also displace thyroid hormones from protein binding sites. *Risk C: Monitor therapy*

Rifampin: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Sodium Iodide I131: Thyroid Products may diminish the therapeutic effect of Sodium Iodide I131. *Risk X: Avoid combination*

Theophylline Derivatives: Thyroid Products may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Thyroid Products may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, may decrease level/effect of oral hypoglycemics, increase risk of toxicity with TCAs and some anorectics). Assess results of laboratory tests at baseline and regularly during therapy. **Note:** Many drugs may effect thyroid function tests. Monitor for hyperthyroidism (weight loss, nervousness, sweating, tachycardia, insomnia, heat intolerance, palpitations, vomiting, psychosis, fever, seizures, angina, arrhythmias). Caution patients with diabetes to monitor glucose levels closely (may increase need for oral hypoglycemics or insulin). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor T_4 and TSH. TSH is the most reliable guide for evaluating adequacy of thyroid replacement dosage. TSH may be elevated during the first few months of thyroid replacement despite patients being clinically euthyroid. In cases where T_4 remains low and TSH is within normal limits, an evaluation of “free” (unbound) T_4 is needed to evaluate further increase in dosage.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Thyroid replacement therapy is generally for life. Take as directed, in the morning before breakfast. Do not take antacids or iron preparations within 8 hours of thyroid medication. Do not change brands and do not discontinue without consulting prescriber. If you have diabetes, monitor glucose levels closely (may increase need for oral hypoglycemics or insulin). Report chest pain, rapid heart rate, palpitations, heat intolerance, excessive sweating, increased nervousness, agitation, or lethargy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 30 mg, 32.5 mg, 60 mg, 65 mg, 120 mg, 130 mg, 180 mg

Armour® Thyroid: 15 mg, 30 mg, 60 mg, 90 mg, 120 mg, 180 mg, 240 mg, 300 mg

Mechanism of Action

The primary active compound is T_3 (triiodothyronine), which may be converted from T_4 (thyroxine) and then circulates throughout the body to influence growth and maturation of various tissues; exact mechanism of action is unknown; however, it is believed the thyroid hormone exerts its many metabolic effects through control of DNA transcription and protein synthesis; involved in normal metabolism, growth, and development; promotes gluconeogenesis, increases utilization and mobilization of glycogen stores and stimulates protein synthesis, increases basal metabolic rate

Pharmacodynamics/Kinetics

Absorption: T_4: 48% to 79%; T_3: 95%; desiccated thyroid contains thyroxine, liothyronine, and iodine (primarily bound)

Metabolism: Thyroxine: Largely converted to liothyronine

Half-life elimination, serum: Liothyronine: 1-2 days; Thyroxine: 6-7 days

Pharmacotherapy Pearls

Equivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

Dental Health: Effects on Dental Treatment

No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

No precautions with vasoconstrictor are necessary if patient is well controlled with thyroid preparations

Mental Health: Effects on Mental Status

May cause nervousness or insomnia

Mental Health: Effects on Psychiatric Treatment

Use to augment antidepressants and treat lithium-induced hypothyroidism

Anesthesia and Critical Care Concerns/Other Considerations

Equivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

Medication Safety Issues

Sound-alike/look-alike issues:

Thyrogen® may be confused with Thyrolar®

Pronunciation(thye roe TROH pin AL fa)

U.S. Brand NamesThyrogen®

Canadian Brand NamesThyrogen®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsAs an adjunctive diagnostic tool for serum thyroglobulin (Tg) testing; adjunctive treatment for radioiodine ablation of thyroid tissue remnants after total or near-total thyroidectomy in patients with well-differentiated thyroid cancer without evidence of metastatic disease

Potential clinical uses include: Patients with an undetectable Tg on thyroid hormone suppressive therapy to exclude the diagnosis of residual or recurrent thyroid cancer, patients requiring serum Tg testing and radioiodine imaging who are unwilling to undergo thyroid hormone withdrawal testing and whose treating physician believes that use of a less sensitive test is justified, patients who are either unable to mount an adequate endogenous TSH response to thyroid hormone withdrawal or in whom withdrawal is medically contraindicated, and patients without evidence of metastatic disease to ablate thyroid remnants (in combination with radioiodine [I^{131}]) following near-total thyroidectomy.

Dosing: Adults**Radioiodine imaging or ablation:** I.M.: 0.9 mg, followed 24 hours later by a second 0.9 mg dose

For radioiodine imaging or remnant ablation, radioiodine administration should be given 24 hours following the second thyrotropin injection. Diagnostic scanning should be performed 48 hours after radioiodine administration (72 hours after the second thyrotropin injection). Post-therapy scanning may be delayed (additional days) to allow decline of background activity.

For serum Tg testing, serum Tg should be obtained 72 hours after final injection of thyrotropin.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Diagnostic aid:** Children >16 years: Refer to adult dosing.

Administration: I.M.After reconstitution with 1.2 mL sterile water for injection, 1 mL of the resulting solution (0.9 mg/mL) should be administered into the buttock.

StorageStore intact vials at 2°C to 8°C (36°F to 46°F). If necessary, the reconstituted solution can be stored for up to 24 hours at 2°C to 8°C (36°F to 46°F). Protect from light.

ReconstitutionReconstitute each vial with 1.2 mL of sterile water for injection to a final concentration of 0.9 mg/mL. Each vial should be reconstituted immediately prior to use with diluent provided.

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Bovine TSH hypersensitivity: Caution should be exercised when administered to patients who have been previously treated with bovine TSH and, in particular, to those patients who have experienced hypersensitivity reactions to bovine TSH.

- Metastatic disease: Use with caution in patients with extensive metastatic disease. May cause edema and/or hemorrhage at metastatic sites, leading to impingement of vital anatomic structures. Pretreatment with corticosteroids may be considered.

- Renal impairment: Thyrotropin alfa elimination is significantly reduced in dialysis-dependent end-stage renal impairment, leading to prolonged elevation of thyroid-stimulating hormone (TSH) levels.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with known history of heart disease in the presence of significant residual thyroid tissue; thyrotropin-induced hyperthyroidism may lead to serious cardiovascular complications.

- Residual thyroid tissue: Use with caution in patients with significant residual thyroid tissue; will cause significant increases in thyroid hormone levels.

- Underlying illness: Use with caution in patients with serious underlying illness in the presence of significant residual thyroid tissue; thyrotropin-induced hyperthyroidism may lead to serious complications.

Special populations:

- Elderly: Thyrotropin use in elderly (with functioning thyroid tumors) may result in palpitations or cardiac rhythm disorders; arrhythmia has been reported in elderly patients with pre-existing cardiac disease; carefully evaluate risk versus benefit.

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Other warnings/precautions:

- Administration: For I.M. use only.
- Considerations in the use of thyrotropin alfa:
  1. There remains a meaningful risk of missing the diagnosis of thyroid cancer or of underestimating the extent of disease when thyrotropin-stimulated Tg testing is performed even in combination with radioiodine imaging.
  2. Thyrotropin Tg levels are generally lower than, and do not correlate with, Tg levels after thyroid hormone withdrawal.
  3. Newly detectable Tg level or a Tg level rising over time after thyrotropin or a high index of suspicion of metastatic disease, even in the setting of a negative or low-stage thyrotropin radioiodine scan, should prompt further evaluation such as thyroid hormone withdrawal to definitively establish the location and extent of thyroid cancer.
  4. Decision to perform a thyrotropin radioiodine scan in conjunction with a thyrotropin serum Tg test and whether or when to withdraw a patient from thyroid hormones are complex. Pertinent factors in this decision include the sensitivity of the Tg assay used, the thyrotropin Tg level obtained, and the index of suspicion of recurrent or persistent local or metastatic disease.
  5. The signs and symptoms of hypothyroidism which accompany thyroid hormone withdrawal are avoided with thyrotropin use.
  6. Clinical experience in thyroid remnant ablation with thyrotropin is limited; long-term outcome data have not been established compared to withholding thyroid hormone.
  7. Thyrotropin studies for thyroid remnant ablation used I^{131} activity of 100 mCi ± 10%; activity of I^{131} used in clinical practice may vary; lower radioiodine doses may not be as effective.

Pregnancy Risk FactorC

Pregnancy Considerations

Animal studies have not been conducted. Effects on the fetus or pregnant woman are unknown.

Lactation

Excretion in breast milk unknown/use caution

Adverse Reactions

>10 %: Gastrointestinal: Nausea (3% to 12%)

1% to 10%:

Central nervous system: Headache (1% to 7%), dizziness (≤3%), fatigue (1% to 3%), insomnia (≤2%)

Endocrine & metabolic: Hypercholesterolemia (≤3%), cholesterol abnormal (≤1%)

Gastrointestinal: Vomiting (1% to 3%), diarrhea (≤1%)

Neuromuscular & skeletal: Paresthesia (≤2%), weakness (≤2%)

Respiratory: Nasopharyngitis (≤1%)

Adverse reactions which may be related to local edema or hemorrhage at metastatic sites: Acute visual loss, enlargement of locally-recurring papillary carcinoma (accompanied by dyspnea, stridor, or dysphonia), hemiplegia, hemiparesis, laryngeal edema with respiratory distress, pain

<1%, postmarketing, and/or case reports: Atrial arrhythmia, flu-like syndrome (arthralgia, chills, fever, myalgia, shivering); hypersensitivity reactions (eg, flushing, pruritus, rash, respiratory difficulty, urticaria); hyperthyroidism, MI, taste loss, thyrotropin alfa antibody formation

Drug InteractionsThere are no known significant interactions.

Test InteractionsThyroglobulin assay may be confounded by thyroglobulin antibodies, possibly leading to misinterpreted or difficult to interpret thyroglobulin levels.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Thyrogen®: 1.1 mg

Generic AvailableNo

Mechanism of ActionThyrotropin alfa, derived from a recombinant DNA source, has the identical amino acid sequence as endogenous human thyroid stimulating hormone (TSH). As a diagnostic tool in conjunction with serum thyroglobulin (Tg) testing, thyrotropin alfa stimulates the secretion of Tg from any remaining thyroid tissues (remnants). Under conditions of successful thyroidectomy and complete ablation, very little serum Tg should be detected under TSH stimulatory conditions; conversely, elevated Tg levels suggest the presence of remnant thyroid tissues. Since the source of TSH is exogenous, stimulation of Tg synthesis can be achieved in euthyroid patients, avoiding the need for thyroid hormone withdrawal.

As an adjunctive agent for radioiodine ablation treatment of thyroid cancer tissue remnants, thyrotropin alfa binds to TSH receptors on these tissues, stimulating the uptake and organification of iodine, including radiolabeled iodine (I^{131}). Cancerous tissue is destroyed via gamma emission from the radioiodine concentrated in these tissues.

Pharmacodynamics/Kinetics

Half-life elimination: 25 ± 10 hours

Time to peak: Median: 10 hours (range: 3-24 hours)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

TiaGABine may be confused with tiZANidine

Pronunciation(tye AG a been)

U.S. Brand NamesGabitril®

Canadian Brand NamesGabitril®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsAdjunctive therapy in adults and children ≥12 years of age in the treatment of partial seizures

Dosing: Adults**Partial seizures (adjunct):** Oral:

Patients receiving enzyme-inducing AED regimens: 4 mg once daily for 1 week; may increase by 4-8 mg weekly to response or up to 56 mg daily in 2-4 divided doses; usual maintenance: 32-56 mg/day

Patients **not** receiving enzyme-inducing AED regimens: The estimated plasma concentrations of tiagabine in patients not taking enzyme-inducing medications is twice that of patients receiving enzyme-inducing AEDs. Lower doses are required; slower titration may be necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Partial seizures:** Oral:

Patients receiving enzyme-inducing AED regimens: Children 12-18 years: 4 mg once daily for 1 week; may increase to 8 mg daily in 2 divided doses for 1 week; then may increase by 4-8 mg weekly to response or up to 32 mg daily in 2-4 divided doses

Patients **not** receiving enzyme-inducing AED regimens: Refer to adult dosing.

Dietary ConsiderationsTake with food.

ContraindicationsHypersensitivity to tiagabine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Dermatologic reactions: Severe reactions, including toxic epidermal necrolysis and Stevens-Johnson syndromes, although rarely reported, have resulted in fatalities; drug should be discontinued if there are any signs of hypersensitivity.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Enzyme-inducing drugs: Experience in patients not receiving enzyme-inducing drugs has been limited; caution should be used in treating any patient who is not receiving one of these medications (decreased dose and slower titration may be required).
- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Unlabeled use: New-onset seizures and status epilepticus have been associated with tiagabine use when taken for unlabeled indications; often these seizures have occurred shortly after the initiation of treatment or shortly after a dosage increase. Seizures have also occurred with very low doses or after several months of therapy. In most cases, patients were using concomitant medications (eg, antidepressants, antipsychotics, stimulants, narcotics). In these instances, the discontinuation of tiagabine, followed by an evaluation for an underlying seizure disorder, is suggested. Use for unapproved indications, however, has not been proven to be safe or effective and is not recommended.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsNo special recommendations are made for the elderly; dose according to response.
Pregnancy Risk FactorC
LactationEnters breast milk/not recommended
Adverse Reactions

>10%:

Central nervous system: Concentration decreased, dizziness, nervousness, somnolence

Gastrointestinal: Nausea

Neuromuscular & skeletal: Tremor, weakness

1% to 10%:

Cardiovascular: Chest pain, edema, hypertension, palpitation, peripheral edema, syncope, tachycardia, vasodilation

Central nervous system: Agitation, ataxia, chills, confusion, depersonalization, depression, difficulty with memory, euphoria, hallucination, hostility, insomnia, malaise, migraine, paranoid reaction, personality disorder, speech disorder

Dermatologic: Alopecia, bruising, dry skin, pruritus, rash

Gastrointestinal: Abdominal pain, appetite increased, diarrhea, gingivitis, mouth ulceration, stomatitis, vomiting, weight gain/loss

Neuromuscular & skeletal: Abnormal gait, arthralgia, dysarthria, hyper-/hypokinesia, hyper-/hypotonia, myasthenia, myalgia, myoclonus, neck pain, paresthesia, reflexes decreased, stupor, twitching, vertigo

Ocular: Abnormal vision, amblyopia, nystagmus

Otic: Ear pain, hearing impairment, otitis media, tinnitus

Respiratory: Bronchitis, cough, dyspnea, epistaxis, pneumonia

Miscellaneous: Allergic reaction, cyst, diaphoresis, flu-like syndrome, lymphadenopathy

<1% (Limited to important or life-threatening): Abortion, abscess, amenorrhea, anemia, angina, apnea, arthrosis, asthma, blepharitis, blindness, cellulitis, cerebral ischemia, cholycystitis, cholelithiasis, CNS neoplasm, coma, deafness, dehydration, dysphagia, dystonia, electrocardiogram abnormal, encephalopathy, facial hemorrhage, erythrocytes abnormal, fecal incontinence, glossitis, goiter, herpes simplex/zoster, hirsutism, hematuria, hemiplegia, hemoptysis, hepatomegaly, hyperacusis, hypercholesteremia, hyper-/hypoglycemia, hyperlipemia, hyperventilation, hypokalemia, hyponatremia, hypotension, hypothyroidism, impotence, kidney failure, leukopenia, liver function tests abnormal, MI, neoplasm, peripheral vascular disorder, paralysis, photophobia, psychosis, petechia, photosensitivity, seizure (when used for unlabeled uses), sepsis, skin benign neoplasm, skin discoloration, spasm, suicide attempt, taste perversion, thrombocytopenia, thrombophlebitis, urinary retention, urinary urgency, urticaria, visual field defect

Metabolism/Transport Effects**Substrate** of 3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food reduces the rate but not the extent of absorption.

Herb/Nutraceutical: St John's wort may decrease tiagabine levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersA reduction in seizure frequency is indicative of therapeutic response to tiagabine in patients with partial seizures; complete blood counts, renal function tests, liver function tests, and routine blood chemistry should be monitored periodically during therapy

Reference RangeMaximal plasma level after a 24 mg/dose: 552 ng/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness (seizure activity, force, type, duration), laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, seizure safety precautions, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsA therapeutic range for tiagabine has not been established. Monitor complete blood counts, renal function tests, liver function tests, and routine blood chemistry.

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, disturbed concentration, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Wear identification of epileptic status and medications. Report behavioral or CNS changes, suicidal ideation, or depression; skin rash; muscle cramping, weakness, tremors, changes in gait; vision difficulties; persistent GI distress (cramping, pain, vomiting); chest pain, irregular heartbeat, or palpitations; cough or respiratory difficulty; or worsening of seizure activity or loss of seizure control. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride:

Gabitril®: 2 mg, 4 mg, 12 mg, 16 mg

Generic AvailableNo

ManufacturerCephalon

Pricing: U.S. (www.drugstore.com)

Tablets (Gabitril)

2 mg (30): $149.48

4 mg (30): $137.99

12 mg (30): $161.01

16 mg (30): $233.98

Mechanism of ActionThe exact mechanism by which tiagabine exerts antiseizure activity is not definitively known; however, *in vitro* experiments demonstrate that it enhances the activity of gamma aminobutyric acid (GABA), the major neuroinhibitory transmitter in the nervous system; it is thought that binding to the GABA uptake carrier inhibits the uptake of GABA into presynaptic neurons, allowing an increased amount of GABA to be available to postsynaptic neurons; based on *in vitro* studies, tiagabine does not inhibit the uptake of dopamine, norepinephrine, serotonin, glutamate, or choline

Pharmacodynamics/Kinetics

Absorption: Rapid (45 minutes); prolonged with food

Protein binding: 96%, primarily to albumin and α_1-acid glycoprotein

Metabolism: Hepatic via CYP (primarily 3A4)

Bioavailability: Oral: Absolute: 90%

Half-life elimination: 2-5 hours when administered with enzyme inducers; 7-9 hours when administered without enzyme inducers

Time to peak, plasma: 45 minutes

Excretion: Feces (63%); urine (25%); 2% as unchanged drug; primarily as metabolites

Pharmacotherapy PearlsAnimal studies suggest that tiagabine may bind to retina and uvea; however, no treatment-related ophthalmoscopic changes were seen long-term; periodic monitoring may be considered.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, gingivitis, and mouth ulceration.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsTiagabine Hydrochloride

Tiaprofenic Acid

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(tye ah PRO fen ik AS id)

Canadian Brand NamesApo-Tiaprofenic®; Dom-Tiaprofenic; Novo-Tiaprofenic; Nu-Tiaprofenic; PMS-Tiaprofenic; Surgam®; Tiaprofenic-200; Tiaprofenic-300

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsRelief of signs and symptoms of rheumatoid arthritis and osteoarthritis (degenerative joint disease)

Dosing: Adults

Rheumatoid arthritis: Oral:

Tablet: Usual initial and maintenance dose: 600 mg/day in 3 divided doses; some patients may do well on 300 mg twice daily; maximum daily dose: 600 mg

Sustained release capsule: Initial and maintenance dose: 2 sustained release capsules of 300 mg once daily

Osteoarthritis: Oral:

Tablet: Usual initial and maintenance dose: 600 mg/day in 2 or 3 divided doses; in rare instances patients may be maintained on 300 mg/day in divided doses; maximum daily dose: 600 mg

Sustained release capsule: Initial and maintenance dose: 2 sustained release capsules of 300 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo specific dosage adjustment recommended; note caution in renal impairment.

Administration: OralAdminister with food or milk. Capsule should be swallowed whole.

Dietary ConsiderationsShould be taken with food or milk.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to tiaprofenic acid, any component of the formulation, aspirin, or other nonsteroidal anti-inflammatory drugs (NSAIDs); asthma or nasal polyps; active hepatic disease; renal insufficiency (Cl_{cr} <30 mL/minute); active peptic ulcer or active inflammatory disease of gut (diverticulosis, ulcerative colitis, Crohn's disease); pregnancy (3rd trimester)

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Fatal asthmatic and anaphylactoid reactions have occurred in patients with “aspirin triad.”
- Cardiovascular events: NSAIDs are associated with an increased risk of adverse cardiovascular events, including MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Cystitis: Severe cases of cystitis (bladder pain, dysuria, urinary frequency, hematuria) have been reported. Avoid use in patients with prior history of urinary symptoms and discontinue at first sign of genitourinary problems.
- Gastrointestinal events: Gastrointestinal bleeding may occur without prior symptoms of gastrointestinal irritation. Use with caution in patients with a history of GI disease (bleeding, ulcers, or previous GI symptoms with NSAID use.

Disease-related concerns:

- Asthma: Do not administer to patients with asthma; severe bronchospasm may occur.
- Autoimmune disease: Patients with autoimmune disorders may be at greater risk of developing aseptic meningitis, as rare adverse reaction associated with some NSAIDs.
- Hepatic impairment: Use with caution in patients with decreased hepatic function.
- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Contraindicated in patients with deteriorating function or severe impairment (Cl_{cr} <30 mL/minute). Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Effective dose: Use lowest effective dose for shortest period possible; bleeding risk has been correlated to dose and duration of therapy.
- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are at a high risk for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers, omeprazole, and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol is the only prophylactic agent proven effective. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} 30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorNot assigned; contraindicated (per manufacturer)

Pregnancy ConsiderationsAdequate and well-controlled studies have not been conducted in pregnant women. Fetal exposure to NSAIDs late in pregnancy is associated with premature closure of ductus arteriosus. First trimester miscarriages have been reported.

LactationEnters breast milk/not recommended (AAP rates other NSAIDs "compatible")

Adverse Reactions

1% to 10%:

Cardiovascular: Fluid retention, flushing

Central nervous system: Dizziness, headache, drowsiness, depression

Dermatologic: Rash, pruritus, erythema

Endocrine & metabolic: Hyperkalemia (2%)

Gastrointestinal: Dyspepsia (up to 14%), nausea, heartburn, epigastric distress, vomiting, abdominal pain, constipation, flatulence, diarrhea, stomatitis, xerostomia

Hematologic: Decreased hemoglobin/hematocrit (2.8%)

Renal: Increased BUN (up to 12% in elderly)

<1% (Limited to important or life-threatening): Anaphylaxis, angina, angioedema, asthma, bronchospasm, cystitis, disorientation, duodenal ulcer, dysuria, edema, enterocolitis, erythema multiforme, gastric ulcer, gastrointestinal hemorrhage, hepatotoxicity, hypertension, incontinence, increased serum creatinine, interstitial nephritis, intestinal perforation, melena, menstrual irregularities, paresthesia, photosensitivity, renal failure, Stevens-Johnson syndrome, thrombocytopenia, tinnitus, toxic epidermal necrolysis, urticaria, vaginal bleeding, vertigo. Aseptic meningitis, neutropenia, and leukopenia have been associated rarely with NSAIDs.

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Tiaprofenic acid peak serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersCBC; occult blood loss and periodic liver function tests; monitor response (pain, range of motion, grip strength, mobility, ADL function), inflammation; observe for weight gain, edema; monitor renal function (urine output, serum BUN, and creatinine); observe for bleeding, bruising; evaluate gastrointestinal effects (abdominal pain, bleeding, dyspepsia); mental confusion, disorientation; with long-term therapy, periodic ophthalmic exams

Nursing: Physical Assessment/MonitoringAssess patient for allergic reaction to salicylates or other NSAIDs (see Contraindications). Assess other medications patient may be taking for additive or adverse interactions (see Warnings/Precautions and Drug Interactions). Monitor therapeutic effectiveness, and signs of adverse reactions or overdose (see Adverse Reactions) at beginning of therapy and periodically during long-term therapy. Instruct patient to report dysuria or other urinary problems immediately. Assess knowledge/teach patient appropriate use. Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects. **Pregnancy risk factor not assigned** - see Pregnancy Risk Factor; benefits of use should outweigh possible risks. Breast-feeding is not recommended.

Monitoring: Lab TestsCBC, periodic liver function, renal function (serum BUN and creatinine)

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Adverse reactions can occur with overuse. Consult your prescriber before use if you have hypertension or heart failure. Take with food or milk. While using this medication, do not use alcohol, other prescription or OTC medications containing aspirin or salicylate, or other NSAIDs without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea, vomiting, gastric discomfort (frequent mouth care, small, frequent meals, chewing gum, sucking lozenges may help). GI bleeding, ulceration, or perforation can occur with or without pain. Stop taking medication and report urinary tract/bladder problems, ringing in ears; persistent cramping or stomach pain; unresolved nausea or vomiting; respiratory difficulty or shortness of breath; unusual bruising or bleeding (mouth, urine, stool); skin rash; unusual swelling of extremities; chest pain; or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, sustained release: 300 mg

Tablet: 200 mg, 300 mg

Generic AvailableYes
ManufacturerAventis Pharma (Canada)
Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties
Pharmacodynamics/Kinetics

Absorption: Regular release tablet: Rapid

Protein binding: 98%

Metabolism: Minimal (10%) to inactive metabolites

Half-life elimination: 1.7 hours

Time to peak: 30-90 minutes

Excretion: Urine (primarily as unchanged drug)

Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause agitation, confusion, and hallucinations (especially in the elderly). May cause dizziness, drowsiness, or depression.
Mental Health: Effects on Psychiatric TreatmentMay decrease the clearance of lithium resulting in elevated serum levels; monitor.

Ticarcillin and Clavulanate Potassium

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(tye kar SIL in & klav yoo LAN ate poe TASS ee um)
U.S. Brand NamesTimentin®
Canadian Brand NamesTimentin®
Pharmacologic CategoryAntibiotic, Penicillin
Use: Labeled IndicationsTreatment of lower respiratory tract, urinary tract, skin and skin structures, bone and joint, gynecologic (endometritis) and intra-abdominal (peritonitis) infections, and septicemia caused by susceptible organisms. Clavulanate expands activity of ticarcillin to include beta-lactamase producing strains of *S. aureus*, *H. influenzae*, *Bacteroides* species, and some other gram-negative bacilli
Dosing: Adults**Note:** Timentin® (ticarcillin/clavulanate) is a combination product; each 3.1 g dosage form contains 3 g ticarcillin disodium and 0.1 g clavulanic acid.

Systemic infections: I.V.: 3.1 g (ticarcillin 3 g plus clavulanic acid 0.1 g) every 4-6 hours (maximum: 24 g of ticarcillin component/day)

Amnionitis, cholangitis, diverticulitis, endometritis, epididymo-orchitis, mastoiditis, orbital cellulitis, peritonitis, pneumonia (aspiration): I.V.: 3.1 g every 6 hours

Liver abscess, parafascial space infections, septic thrombophlebitis: I.V.: 3.1 g every 4 hours

***Pseudomonas*infections:** I.V.: 3.1 g every 4 hours

Urinary tract infections: I.V.: 3.1 g every 6-8 hours

Dosing: ElderlyI.V.: 3.1 g every 4-6 hours; adjust for renal function.
Dosing: Pediatric**Note:** Timentin® (ticarcillin/clavulanate) is a combination product; each 3.1 g dosage form contains 3 g ticarcillin disodium and 0.1 g clavulanic acid.

Systemic infections:

Children <60 kg: 200-300 mg of ticarcillin component/kg/day in divided doses every 4-6 hours

Children ≥60 kg: 3.1 g (ticarcillin 3 g plus clavulanic acid 0.1 g) every 4-6 hours; maximum: 24 g of ticarcillin component/day

Bite wounds (animal): 200 mg of ticarcillin component/kg/day in divided doses

Neutropenic fever: 75 mg of ticarcillin component/kg every 6 hours (maximum: 3.1 g/dose)

Pneumonia (nosocomial): 300 mg of ticarcillin component/kg/day in 4 divided doses (maximum: 18-24 g of ticarcillin component/day)

Dosing: Renal Impairment

Loading dose: I.V.: 3.1 g one dose, followed by maintenance dose based on creatinine clearance:

Cl_{cr} 30-60 mL/minute: Administer 2 g of ticarcillin component every 4 hours or 3.1 g every 8 hours

Cl_{cr} 10-30 mL/minute: Administer 2 g of ticarcillin component every 8 hours or 3.1 g every 12 hours

Cl_{cr} <10 mL/minute: Administer 2 g of ticarcillin component every 12 hours

Cl_{cr} <10 mL/minute with concomitant hepatic dysfunction: 2 g of ticarcillin component every 24 hours

Moderately dialyzable (20% to 50%)

Continuous ambulatory peritoneal dialysis: 3.1 g every 12 hours

Hemodialysis: 2 g of ticarcillin component every 12 hours; supplemented with 3.1 g after each dialysis

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 2 g every 6-8 hours

CVVHD/CVVHDF: 3.1 g every 6 hours

Note: Do not administer in intervals exceeding every 8 hours. Clavulanate component is hepatically eliminated; extending the dosing interval beyond 8 hours may result in loss of beta-lactamase inhibition.

Dosing: Hepatic ImpairmentWith concomitant renal dysfunction (Cl_{cr} <10 mL/minute): 2 g of ticarcillin component every 24 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Infuse over 30 minutes.

Some penicillins (eg, carbenicillin, ticarcillin and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailpH: 5.5-7.5

Dietary ConsiderationsSodium content of 1 g: 4.51 mEq; potassium content of 1 g: 0.15 mEq

Storage

Vials: Store intact vials at <24°C (<75°F). Reconstituted solution is stable for 6 hours at room temperature and 72 hours when refrigerated. I.V. infusion in NS or LR is stable for 24 hours at room temperature, 7 days when refrigerated, or 30 days when frozen. I.V. infusion in D_5W solution is stable for 24 hours at room temperature, 3 days when refrigerated, or 7 days when frozen. After freezing, thawed solution is stable for 8 hours at room temperature. Darkening of drug indicates loss of potency of clavulanate potassium.

Premixed solution: Store frozen at ≤-20°C (-4°F). Thawed solution is stable for 24 hours at room temperature or 7 days under refrigeration; do not refreeze.

CompatibilityStable in D_5W, LR, NS, sterile water for injection.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, clarithromycin, cyclophosphamide, diltiazem, docetaxel, doxorubicin liposome, etoposide, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, insulin (regular), melphalan, meperidine, morphine, ondansetron, perphenazine, propofol, remifentanil, sargramostim, teniposide, theophylline, thiotepa, vinorelbine. **Incompatible:** Alatrofloxacin, amphotericin B cholesteryl sulfate complex. **Variable (consult detailed reference):** Cisatracurium, topotecan, vancomycin.

Compatibility when admixed: Incompatible: Sodium bicarbonate, aminoglycosides.

ContraindicationsHypersensitivity to ticarcillin, clavulanate, any penicillin, or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concern related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Bleeding disorders: Particularly in patients with renal impairment, bleeding disorders have been observed; discontinue if thrombocytopenia or bleeding occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Heart failure (HF): Use with caution in patients with HF, due to high sodium load.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 months of age.

Geriatric ConsiderationsWhen used as empiric therapy or for a documented pseudomonal pneumonia, it is best to combine with an aminoglycoside such as gentamicin or tobramycin. High sodium content may limit use in patients with congestive heart failure. Adjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies; therefore, ticarcillin/clavulanate is classified as pregnancy category B. Ticarcillin and clavulanate cross the placenta. Human experience with the penicillins during pregnancy has shown no evidence of adverse effects to the fetus. Ticarcillin/clavulanate is approved for the treatment of postpartum gynecologic infections, including endometritis, caused by susceptible organisms.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsSmall amounts of ticarcillin are found in breast milk; however, it is not orally-absorbed. The AAP considers ticarcillin alone to be “usually compatible with breast-feeding.”

Based on available data for ticacillin, ticarcillin/clavulanate is generally considered compatible (low risk to infant) while breast-feeding [human data].

Pregnancy & Lactation, In-Depth

- Ticarcillin and Clavulanate Potassium in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Confusion, drowsiness, fever, headache, Jarisch-Herxheimer reaction, seizure

Dermatologic: Erythema multiforme, pruritus, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Electrolyte imbalance

Gastrointestinal: *Clostridium difficile* colitis, diarrhea, nausea, vomiting

Hematologic: Bleeding, eosinophilia, hemolytic anemia, leukopenia, neutropenia, positive Coombs' reaction, prothrombin time prolonged, thrombocytopenia

Hepatic: Hepatotoxicity, jaundice

Local: Injection site reaction (pain, burning, induration); thrombophlebitis

Neuromuscular & skeletal: Myoclonus

Renal: BUN increased, interstitial nephritis (acute), serum creatinine increased

Miscellaneous: Anaphylaxis, hypersensitivity reactions

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Aminoglycosides: Penicillins may decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. *Risk D: Consider therapy modification*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsPositive Coombs' test, false-positive urinary proteins

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose.
Monitoring: Lab TestsSerum electrolytes, bleeding time, and periodic tests of renal, hepatic, and hematologic function; perform culture and sensitivity before administering first dose.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed, frozen]: Ticarcillin 3 g and clavulanic acid 0.1 g (100 mL) [contains sodium 4.51 mEq and potassium 0.15 mEq per g]

Injection, powder for reconstitution: Ticarcillin 3 g and clavulanic acid 0.1 g (3.1 g, 31 g) [contains sodium 4.51 mEq and potassium 0.15 mEq per g]

Generic AvailableNo
ManufacturerSmithKline Beecham Pharmaceuticals
Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.
Pharmacodynamics/Kinetics

Absorption: Ticarcillin: Not absorbed orally

Protein binding: Ticarcillin: ~45%; Clavulanic acid: ~25%

Metabolism: Clavulanic acid: Hepatic

Half-life elimination: Ticarcillin: 1.1 hours;Clavulanic acid: 1.1 hours

Excretion: Ticarcillin: Urine (60% to 70%); Clavulanic acid: Urine (35% to 45% as unchanged drug)

Clearance: Clavulanic acid does not affect clearance of ticarcillin

Related Information

- Antimicrobial Drugs of Choice

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Prolonged use of penicillins may lead to development of oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or confusion; penicillins reported to cause apprehension, illusions, hallucinations, depersonalization, agitation, insomnia, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTicarcillin and Clavulanic Acid

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tye KLOE pi deen)

U.S. Brand NamesTiclid® [DSC]

Canadian Brand NamesAlti-Ticlopidine; Apo-Ticlopidine®; Gen-Ticlopidine; Novo-Ticlopidine; Nu-Ticlopidine; Rhoxal-ticlopidine; Sandoz-Ticlopidine; Ticlid®

Pharmacologic CategoryAntiplatelet Agent

Use: Labeled IndicationsPlatelet aggregation inhibitor that reduces the risk of thrombotic stroke in patients who have had a stroke or stroke precursors. **Note:** Due to its association with life-threatening hematologic disorders, ticlopidine should be reserved for patients who are intolerant to aspirin, or who have failed aspirin therapy. Adjunctive therapy (with aspirin) following successful coronary stent implantation to reduce the incidence of subacute stent thrombosis.

Use: Unlabeled/InvestigationalProtection of aortocoronary bypass grafts, diabetic microangiopathy, ischemic heart disease, prevention of postoperative DVT, reduction of graft loss following renal transplant

Dosing: Adults

Stroke prevention: Oral: 250 mg twice daily

Coronary artery stenting (initiate after successful implantation): Oral: 250 mg twice daily (in combination with antiplatelet doses of aspirin) for up to 30 days

Unstable angina, non-ST-segment elevation myocardial infarction (UA/NSTEMI) undergoing percutaneous coronary intervention (PCI) in patients unable to receive clopidogrel (unlabeled dosing): Initial: 500 mg loading dose given at least 6 hours prior to PCI, followed by 250 mg twice daily (in combination with aspirin 75-325 mg once daily). Duration of therapy dependent upon type of stent implanted during PCI.

Note:*Coronary artery stents:* Duration of ticlopidine (clopidogrel preferred) in combination with aspirin: According to the ACC/AHA/SCAI guidelines, ideally 12 months following drug-eluting stent (DES) placement in patients not at high risk for bleeding; at a minimum, 1, 3, and 6 months for bare metal (BMS), sirolimus-eluting, and paclitaxel-eluting stents, respectively, for uninterrupted therapy (Smith, 2005). The 2008 *Chest* guidelines recommend for patients who undergo PCI and receive a BMS (with ongoing ACS) or a DES (with or without ongoing ACS) that ticlopidine (clopidogrel preferred) be continued for at least 12 months. In patients receiving a BMS without ongoing ACS, ticlopidine (or clopidogrel) may be continued for at least 1 month. In patients receiving a DES, therapy with ticlopidine (or clopidogrel) beyond 12 months may be considered in patients without bleeding or tolerability issues (Becker, 2008). Premature interruption of therapy may result in stent thrombosis with subsequent fatal and nonfatal myocardial infarction.

Dosing: Elderly250 mg twice daily with food; dosage in older patients has not been determined; however, in two large clinical trials, the average age of subjects was 63 and 66 years. A dosage decrease may be necessary if bleeding develops.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentNo specific guidelines for patients with hepatic impairment; use with caution. Use is contraindicated with severe renal impairment.

Administration: OralAdminister with food.

Dietary ConsiderationsShould be taken with food to reduce stomach upset.

ContraindicationsHypersensitivity to ticlopidine or any component of the formulation; active pathological bleeding such as peptic ulcer disease (PUD) or intracranial hemorrhage; severe liver dysfunction; hematopoietic disorders (neutropenia, thrombocytopenia, a past history of TTP or aplastic anemia)

Allergy Considerations

- Thienopyridine Allergy

Warnings/Precautions

Boxed warnings:

- Hematologic toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hematologic toxicity: **[U.S. Boxed Warning]: May cause life-threatening hematologic reactions, including neutropenia, agranulocytosis, thrombotic thrombocytopenia purpura (TTP), and aplastic anemia.** Routine monitoring is required (see Monitoring Parameters). Monitor for signs and symptoms of neutropenia including WBC count. Discontinue if the absolute neutrophil count falls to $<1200/mm^3$ or if the platelet count falls to $<80,000/mm^3$.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with platelet disorders, bleeding disorders and/or at increased risk for bleeding (eg, PUD, trauma, or surgery).

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment. Use is contraindicated with severe hepatic impairment.

- Renal impairment: Use with caution in patients with moderate-to-severe renal impairment (experience is limited); bleeding times may be significantly prolonged and the risk of hematologic adverse events (eg, neutropenia) may be increased.

Concurrent drug therapy issues:

- Anticoagulants and platelet aggregation inhibitors: Use with caution in patients receiving either anticoagulants (eg, heparin, warfarin) or other platelet aggregation inhibitors; bleeding risk is increased.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Coronary artery stents: In patients who have received bare-metal or drug-eluting stents (sirolimus or paclitaxel), premature interruption of antiplatelet therapy may result in stent thrombosis with subsequent fatal and nonfatal myocardial infarction. Ideally, 12 months following drug-eluting stent placement in patients not at high risk for bleeding is preferred; minimum durations of therapy are 1 month, 3 months, and 6 months for bare metal stents, sirolimus-eluting stents (Cypher®), and paclitaxel-eluting stents (Taxus®), respectively.

- Elective surgery: Consider discontinuing 10-14 days before elective surgery (except in patients with cardiac stents that have not completed their full course of dual antiplatelet therapy; patient-specific situations need to be discussed with cardiologist; AHA/ACC/SCAI/ACS/ADA Science Advisory provides recommendations).

Geriatric ConsiderationsBecause of the risk of neutropenia and its relative expense as compared with aspirin, ticlopidine should only be used in patients with a documented intolerance to aspirin.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is associated with ticlopidine. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the use of multiple agents which alter hemostasis and patient susceptibility.

>10%:

Endocrine & metabolic: Total cholesterol increased (increases of ~8% to 10% within 1 month of therapy), triglycerides increased

Gastrointestinal: Diarrhea (13%)

1% to 10%:

Central nervous system: Dizziness (1%)

Dermatologic: Rash (5%), purpura (2%), pruritus (1%)

Gastrointestinal: Nausea (7%), dyspepsia (7%), gastrointestinal pain (4%), vomiting (2%), flatulence (2%), anorexia (1%)

Hematologic: Neutropenia (2%)

Hepatic: Alkaline phosphatase increased (>2 x upper limit of normal; 8%), abnormal liver function test (1%)

<1% (Limited to important or life-threatening): Agranulocytosis, anaphylaxis, angioedema, aplastic anemia, arthropathy, bilirubin increased, bone marrow suppression, conjunctival bleeding, ecchymosis, eosinophilia, epistaxis, erythema multiforme, erythema nodosum, exfoliative dermatitis, gastrointestinal bleeding, headache, hematuria, hemolytic anemia, hepatic necrosis, hepatitis, hyponatremia, intracranial bleeding (rare), jaundice, maculopapular rash, menorrhagia, myositis, nephrotic syndrome, pain, pancytopenia, peptic ulcer, peripheral neuropathy, pneumonitis (allergic), positive ANA, renal failure, sepsis, serum sickness, Stevens-Johnson syndrome, systemic lupus erythematosus, thrombocytopenia (immune), thrombocytosis, thrombotic thrombocytopenic purpura (TTP), tinnitus, urticaria, vasculitis, weakness

Postmarketing and/or case reports: Chronic diarrhea, increase in serum creatinine, bronchiolitis obliterans-organized pneumonia

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (strong), 2D6 (moderate), 2E1 (weak), 3A4 (weak)

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Ticlopidine may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Theophylline Derivatives: Ticlopidine may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Ticlopidine bioavailability may be increased (20%) if taken with food. High-fat meals increase absorption, antacids decrease absorption.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, chamomile, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American), ginseng (Panax), ginseng (Siberian), grape seed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersSigns of bleeding; CBC with differential every 2 weeks starting the second week through the third month of treatment; more frequent monitoring is recommended for patients whose absolute neutrophil counts have been consistently declining or are 30% less than baseline values. The peak incidence of TTP occurs between 3-4 weeks, the peak incidence of neutropenia occurs at approximately 4-6 weeks, and the incidence of aplastic anemia peaks after 4-8 weeks of therapy. Few cases have been reported after 3 months of treatment. Liver function tests (alkaline phosphatase and transaminases) should be performed in the first 4 months of therapy if liver dysfunction is suspected.

Nursing: Physical Assessment/MonitoringMonitor effectiveness of therapy (laboratory results) frequently at beginning of treatment and regularly thereafter. Monitor and teach patient bleeding precautions, possible side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet counts every 2 weeks starting the second week through the third month of treatment; more frequent monitoring is recommended for patients whose absolute neutrophil counts have been consistently declining or are 30% less than baseline values. Liver function tests (alkaline phosphatase and transaminases) should be performed in the first 4 months of therapy if liver dysfunction is suspected.

Patient EducationTake exact dosage prescribed, with food. Do not use aspirin or aspirin-containing medications and OTC medications without consulting prescriber. You may experience easy bleeding or bruising (use soft toothbrush or cotton swabs and frequent mouth care, use electric razor, avoid sharp knives or scissors). Report unusual bleeding or bruising, persistent fever, sore throat, weakness, paleness, changes in neurological status; blood in urine, stool, or vomitus; delayed healing of any wounds; skin rash; yellowing of skin or eyes; changes in color of urine or stool; pain or burning on urination; respiratory difficulty; or skin rash. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as hydrochloride: 250 mg

Ticlid®: 250 mg [DSC]

Generic AvailableYes
ManufacturerRoche Laboratories Inc
Pricing: U.S. (www.drugstore.com)

Tablets (Ticlid)

250 mg (30): $79.99

Tablets (Ticlopidine HCl)

250 mg (60): $100.99

250 mg (100): $225.98

Mechanism of ActionTiclopidine requires *in vivo* biotransformation to an unidentified active metabolite. This active metabolite irreversibly blocks the P2Y12 component of ADP receptors, which prevents activation of the GPIIb/IIIa receptor complex, thereby reducing platelet aggregation. Platelets blocked by ticlopidine are affected for the remainder of their lifespan.
Pharmacodynamics/Kinetics

Onset of action: ~6 hours

Peak effect: 3-5 days; serum levels do not correlate with clinical antiplatelet activity

Absorption: Well absorbed

Protein binding: Parent drug: 98%; <15% bound to alpha$_1$-acid glycoprotein

Metabolism: Extensively hepatic; has at least 1 active metabolite

Half-life elimination: 13 hours

Time to peak, serum: ~2 hours

Excretion: Urine (60%); feces (23%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported; if a patient is to undergo elective surgery and an antiplatelet effect is not desired, ticlopidine should be discontinued at least 7 days prior to surgery.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine
Cardiovascular ConsiderationsMay be used for secondary prevention with an efficacy at least similar to that of aspirin. Indicated in patients with unstable angina and non-ST-segment elevation myocardial infarction (UA/NSTEMI) who are unable to tolerate aspirin due to hypersensitivity or gastrointestinal disease. It takes time to achieve full antiplatelet effect. The adverse effect profile including neutropenia and thrombotic thrombocytopenia purpura (TTP), along with twice-daily dosing and GI upset, makes ticlopidine a less attractive option than clopidogrel. Neutropenia usually resolves within 1-3 weeks of discontinuation of therapy. TTP, although rare, is life-threatening and requires immediate plasma exchange.

Coronary Artery Stents: The 2005 ACC/AHA/SCAI guidelines for PCI recommends that along with aspirin, ticlopidine (clopidogrel preferred) be continued for at least 1 month after bare-metal stent implantation, for several months after drug-eluting stent implantation (3 months for sirolimus, 6 months for paclitaxel), and ideally for up to 12 months in patients who are not at high risk for bleeding. Clopidogrel is the preferred thienopyridine due to its lower incidence of serious side effects (eg, neutropenia) as compared to ticlopidine.

The 2008 *Chest* guidelines recommend for patients who undergo PCI and receive a BMS (with ongoing ACS) or a DES (with or without ongoing ACS) that clopidogrel (or ticlopidine) be continued for at least 12 months. In patients receiving a BMS without ongoing ACS, clopidogrel (or ticlopidine) may be continued for at least 1 month. In patients receiving a DES, therapy with clopidogrel (ticlopidine) beyond 12 months may be considered in patients without bleeding or tolerability issues (Becker, 2008).

The AHA/ACC/SCAI/ACS/ADA Science Advisory (2007) published recommendations (*Circulation*, February 13, 2007) to prevent premature discontinuation of dual antiplatelet therapy (clopidogrel [or ticlopidine] and aspirin) in patients with coronary artery stents. This advisory panel agreed with the 2004 ACC/AHA guidelines stressing the importance of 12 months of dual antiplatelet therapy after placement of a drug-eluting stent (DES) in patients who are not at high risk of bleeding. The advisory panel included these recommendations. Minor surgery, teeth cleaning, and tooth extraction can usually be performed without increased bleeding on the dual antiplatelet regimen. If increased bleeding is anticipated, then the procedure should be delayed until the antiplatelet regimen is completed. Elective procedures with a significant risk of bleeding should be postponed until the antiplatelet regimen is completed. The advisory panel recommends healthcare providers who perform invasive or surgical procedures contact the patient's cardiologist before discontinuing antiplatelet therapy. For patients with drug-eluting stents who must undergo a procedure that requires discontinuation of thienopyridine therapy, aspirin should be continued if possible and the thienopyridine restarted as soon as possible after the procedure. "Bridging" stent patients with warfarin, other antithrombins, or glycoprotein IIb/IIIa agents is not supported by the Advisory Committee.

For the complete review and additional recommendations available at http://www.acc.org/qualityandscience/clinical/pdfs/Final_Dual_Antiplatelet_Statement_010507.pdf.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe adverse effect profile including neutropenia and thrombotic thrombocytopenia purpura (TTP), along with twice-daily dosing and GI upset, makes ticlopidine a less attractive option than clopidogrel. Neutropenia usually resolves within 1-3 weeks of discontinuation of therapy. TTP, although rare, is life-threatening and requires immediate plasma exchange.

Perioperative Management of Ticlopidine: In patients with coronary stents the risk of stent thrombosis becomes elevated depending on the type of stent deployed (bare metal vs drug-eluting stent) and the time from implantation. According to the American College of Chest Physicians (Becker, 2008), the recommended length of therapy for ticlopidine (clopidogrel preferred) is at least 12 months in patients with ACS who undergo PCI with a bare metal stent (BMS) or drug-eluting stent (DES). In patients receiving a BMS without ongoing ACS, ticlopidine (clopidogrel preferred) may be continued for at least 1 month. Early discontinuation of ticlopidine (or clopidogrel) may result in stent thrombosis leading to nonfatal and fatal myocardial infarction. The perioperative recommendations for clopidogrel are below (Douketis, 2008):

Patients undergoing noncardiac surgery (low risk of cardiac event without coronary stent): Ticlopidine and other antiplatelet agents should be temporarily discontinued 5-10 days prior to surgery and resumed ~24 hours (or the next morning) after the procedure when adequate hemostasis is achieved.

Patients without coronary stent undergoing cardiac surgery (eg, CABG) or noncardiac surgery (high risk of cardiac event): Discontinue ticlopidine at least 5 days and, preferably, 10 days prior to surgery while continuing aspirin up to and beyond the time of surgery. If aspirin is interrupted, it should be reinitiated 6-48 hours after surgery; may resume ticlopidine ~24 hours (or the next morning) after the procedure when adequate hemostasis is achieved.

Patients undergoing cardiac surgery (eg, CABG) or noncardiac surgery (with coronary stent): Based on the risk of stent thrombosis, patients with a BMS who require surgery within 6 weeks of implantation or with a DES who require surgery within 12 months of implantation should continue on both aspirin and ticlopidine (clopidogrel preferred) during the perioperative period.

The AHA/ACC/SCAI/ACS/ADA Science Advisory (2007) published recommendations (*Circulation*, February 13, 2007) to prevent premature discontinuation of dual antiplatelet therapy (clopidogrel and aspirin) in patients with coronary artery stents. The advisory panel agreed with the 2004 ACC/AHA guidelines stressing the importance of 12 months of dual antiplatelet therapy after placement of a drug-eluting stent (DES) in patients who are not at high risk of bleeding. The advisory panel included these recommendations. Minor surgery, teeth cleaning, and tooth extraction can usually be performed without increased bleeding on the dual antiplatelet regimen. If increased bleeding is anticipated, then the procedure should be delayed until the antiplatelet regimen is completed. Elective procedures with a significant risk of bleeding should be postponed until the antiplatelet regimen is completed. The advisory panel recommends healthcare providers who perform invasive or surgical procedures contact the patient's cardiologist before discontinuing antiplatelet therapy. For patients with drug-eluting stents who must undergo a procedure that requires discontinuation of thienopyridine therapy, aspirin should be continued if possible and the thienopyridine restarted as soon as possible after the procedure. "Bridging" stent patients with warfarin, other antithrombins, or glycoprotein IIb/IIIa agents is not supported by the Advisory Committee.

Tigecycline

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(tye ge SYE kleen)

U.S. Brand NamesTygacil®

Pharmacologic CategoryAntibiotic, Glycylcycline

Use: Labeled IndicationsTreatment of complicated skin and skin structure infections caused by susceptible organisms, including methicillin-resistant *Staphylococcus aureus* and vancomycin-sensitive *Enterococcus faecalis*; treatment of complicated intra-abdominal infections

Dosing: Adults **Complicated skin/skin structure or intra-abdominal infections:** I.V.:
Initial: 100 mg as a single dose

Maintenance dose: 50 mg every 12 hours

Recommended duration of therapy: Intra-abdominal infections or complicated skin/skin structure infections: 5-14 days.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment No dosage adjustment required in renal impairment or after hemodialysis.

Dosing: Hepatic Impairment
Mild-to-moderate hepatic disease: No dosage adjustment required

Severe hepatic impairment (Child-Pugh class C): Initial dose of 100 mg should be followed with 25 mg every 12 hours

Administration: I.V.Infuse over 30-60 minutes through dedicated line or via Y-site

StorageStore at 15°C to 30°C (59°F to 86°F) prior to reconstitution. Once reconstituted, may be stored at room temperature for up to 24 hours (up to 6 hours in the vial and after further dilution, in the I.V. bag). Alternatively, may be refrigerated for up to 45 hours following immediate transfer of the reconstituted solution into the I.V. bag.

ReconstitutionAdd 5.3 mL NS or D5W to each 50 mg vial. Swirl gently to dissolve. Resulting solution is 10 mg/mL. Transfer immediately to 100 mL I.V. bag for infusion (final concentration should not exceed 1 mg/mL). Reconstituted solution is red-orange.

CompatibilityStable in NS or D_5W.

Y-site administration: Compatible: Amikacin, dobutamine, dopamine, gentamicin, haloperidol, LR, lidocaine, morphine, norephinephrine, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, theophylline, tobramycin. **Incompatible:** Amphotericin B, diazepam.

Contraindications Hypersensitivity to tigecycline or any component of the formulation

Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Antianabolic effects: May be associated with antianabolic effects observed with the tetracycline class (including increased BUN, azotemia, acidosis, and hyperphosphatemia).
- Pancreatitis: May be associated with pancreatitis due to structural similarities with tetracyclines.
- Photosensitivity: May be associated with photosensitivity due to structural similarities with tetracyclines.
- Pseudotumor cerebri: May be associated with pseudotumor cerebri due to structural similarities with tetracyclines.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.
- Tetracycline allergy: Due to structural similarity with tetracyclines, use with caution in patients with prior hypersensitivity and/or severe adverse reactions associated with tetracycline use.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment may be required with severe impairment.
- Intra-abdominal infections: Use with caution if using as monotherapy for patients with intestinal perforation (in the small sample of available cases, septic shock occurred more frequently than patients treated with imipenem/cilastatin comparator).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. Permanent discoloration of the teeth may occur if used during tooth development (fetal stage through children up to 8 years of age).

Geriatric ConsiderationsThe manufacturer reports no significant differences in tigecycline's pharmacokinetics in small numbers of healthy older adults 65-75 years of age and >75 years compared to younger adults following a single 100 mg dose. No dosage adjustment is recommended.

Pregnancy Risk FactorD

Pregnancy ConsiderationsBecause adverse effects were observed in animals and because of the potential for permanent tooth discoloration, tigecycline is classified pregnancy category D. Tigecycline frequently causes nausea and vomiting and, therefore, may not be ideal for use in a patient with pregnancy-related nausea.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if tigecycline is found in breast milk. The manufacturer recommends caution if giving tigecycline to a nursing woman. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Tigecycline in Pregnancy & Lactation

Adverse Reactions **Note:** Frequencies relative to placebo are not available; some frequencies are lower than those experienced with comparator drugs.

>10%: Gastrointestinal: Nausea (25% to 30%; severe in 1%), vomiting (20%; severe in 1%), diarrhea (13%)

2% to 10%:

Cardiovascular: Hypertension (5%), peripheral edema (3%), hypotension (2%), phlebitis (2%)

Central nervous system: Fever (7%), headache (6%), dizziness (4%), pain (4%), insomnia (2%)

Dermatologic: Pruritus (3%), rash (2%)

Endocrine & metabolic: Hypoproteinemia (5%), hyperglycemia (2%), hypokalemia (2%)

Gastrointestinal: Abdominal pain (7%), constipation (3%), dyspepsia (3%)

Hematologic: Thrombocythemia (6%), anemia (4%), leukocytosis (4%)

Hepatic: ALT increased (6%), AST increased (4%), alkaline phosphatase increased (4%), amylase increased (3%), bilirubin increased (2%), LDH increased (4%)

Local: Reaction to procedure (9%)

Neuromuscular & skeletal: Weakness (3%)

Renal: BUN increased (2%)

Respiratory: Cough increased (4%), dyspnea (3%), pulmonary physical finding (2%)

Miscellaneous: Abnormal healing (4%), infection (8%), abscess (3%), diaphoresis increased (2%)

<2%, postmarketing, and/or case reports: Abnormal stools, allergic reaction, anorexia, aPTT prolonged, back pain, bradycardia, chills, creatinine increased, dry mouth, eosinophilia, hypocalcemia, hypoglycemia, hyponatremia, injection site edema, injection site inflammation, injection site pain, injection site phlebitis, injection site reaction, INR increased, jaundice, leukorrhea, pancreatitis (acute), PT prolonged, septic shock, tachycardia, taste perversion, thrombocytopenia, thrombophlebitis, vaginal moniliasis, vaginitis, vasodilatation

Drug Interactions

Warfarin: Tigecycline may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient’s allergy history prior to beginning therapy. Use caution in presence of hepatic impairment or intestinal perforation. Monitor INR when used concomitantly with warfarin. Assess results of therapeutic effectiveness (resolution of infection), and adverse reactions at beginning of and periodically throughout therapy (eg, nausea, vomiting, diarrhea, hypotention, peripheral edema, headache, rash, anemia, dyspnea, opportunistic infection [*C. difficile*], hypersensitivity). Teach patient purpose for use and adverse symptoms to report (refer to Patient Education).

Patient EducationThis medication is only administered intravenously. Report immediately any burning, pain, swelling at infusion site; difficulty breathing or swallowing, chest pain, or chills. Report an gastrointestinal upset (nausea, vomiting, diarrhea or constipation, stomach pain); headache, dizziness, difficulty breathing; increasing sweating, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber in you are pregnant; this drug may cause fetal abnormalities.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Tygacil®: 50 mg [contains lactose 100 mg]

Generic Available No

Manufacturer

Wyeth

Mechanism of ActionBinds to the 30S ribosomal subunit of susceptible bacteria, inhibiting protein synthesis.

Pharmacodynamics/Kinetics **Note:** Systemic clearance is reduced by 55% and half-life increased by 43% in moderate hepatic impairment.

Distribution: V_d: 7-9 L/kg; extensive tissue distribution

Protein binding: 71% to 89%

Metabolism: Hepatic, via glucuronidation, N-acetylation, and epimerization to several metabolites, each <10% of the dose

Half-life elimination: Single dose: 27 hours; following multiple doses: 42 hours

Excretion: Urine (33%; with 22% as unchanged drug); feces (59%; primarily as unchanged drug)

Pharmacotherapy PearlsGenerally considered bacteriostatic. Tigecycline is a derivative of minocycline (9-t-butylglycylamido minocycline), but is not classified as a tetracycline. It has demonstrated activity against a variety of gram-positive and -negative bacterial pathogens.

Dental Health: Effects on Dental TreatmentKey adverse events(s) related to dental treatment: Tigecycline is structurally similar to tetracycline. Therefore, tigecycline is not recommended for use in pregnancy or in children ≤8 years of age. Permanent discoloration of the teeth may occur if used during tooth development.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or insomnia

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with lithium, SSRIs, or valproic acid may produce additive effects

Special Alerts

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Medication Safety Issues

International issues:

Skelid® may be confused with Skaelud® which is a brand name for pyrithione zinc in Denmark

Pronunciation(tye LOO droe nate)

U.S. Brand NamesSkelid®

Pharmacologic CategoryBisphosphonate Derivative

Use: Labeled IndicationsTreatment of Paget's disease of the bone (osteitis deformans) in patients who have a level of serum alkaline phosphatase (SAP) at least twice the upper limit of normal, or who are symptomatic, or who are at risk for future complications of their disease

Dosing: Adults**Paget's disease:** Oral: 400 mg (2 tablets of tiludronic acid) daily for a period of 3 months

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentTiludronate is excreted renally. It is not recommended for use in patients with severe renal impairment (Cl_{cr} <30 mL/minute) and is not removed by dialysis.

Calculations

- Creatinine Clearance: Adults

Administration: OralTake with 6-8 oz of plain water. Should not be taken with beverages containing minerals (eg, mineral water), food, or with other medications (may reduce absorption). Do not take within 2 hours of food, aspirin, indomethacin, or calcium-, magnesium-, or aluminum-containing medications.

Dietary ConsiderationsDo not take within 2 hours of food. Ensure adequate intake of vitamin D and calcium supplements during treatment.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Do not remove tablets from foil strips until they are to be used.

ContraindicationsHypersensitivity to tiludronate, bisphosphonates, or any component of the formulation

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with mild-to-moderate renal impairment (not recommended in patients with a Cl_{cr} <30 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo dose adjustment necessary.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic and nonteratogenic embryo/fetal effects have been reported in animal studies. There are no adequate and well-controlled studies in pregnant women. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if bisphosphonates are administered during pregnancy.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%:

Cardiovascular: Chest pain (3%), edema (3%), flushing, hypertension, syncope

Central nervous system: Anxiety, fatigue, insomnia, nervousness, somnolence, vertigo

Dermatologic: Rash (3%), skin disorder (3%), pruritus

Endocrine & metabolic: Hyperparathyroidism (3%)

Gastrointestinal: Nausea (9%), diarrhea (9%), dyspepsia (5%), vomiting (4%), flatulence (3%), tooth disorder (3%), abdominal pain, anorexia, constipation, gastritis, xerostomia

Genitourinary: Urinary tract infection

Neuromuscular & skeletal: Arthrosis (3%), paresthesia (4%), fractures, muscle spasm, weakness

Ocular: Cataract (3%), conjunctivitis (3%), glaucoma (3%)

Respiratory: Rhinitis (5%), sinusitis (5%), pharyngitis (3%), bronchitis

Miscellaneous: Accidental injury (4%), infection (3%), diaphoresis

<1%, postmarketing, and/or case reports: Musculoskeletal pain (sometimes severe and/or incapacitating), osteonecrosis (primarily of the jaw), Stevens-Johnson syndrome

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Aspirin: May decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Indomethacin: May increase the bioavailability of Tiludronate. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: In single-dose studies, the bioavailability of tiludronate was reduced by 90% when an oral dose was administered with, or 2 hours after, a standard breakfast compared to the same dose administered after an overnight fast and 4 hours before a standard breakfast.
Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Nursing: Physical Assessment/MonitoringAssess history for any previous adverse response to bisphosphonates. Use caution with renal impairment. Patients at risk for osteonecrosis (eg, chemotherapy, corticosteroids, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions. Teach patient appropriate use and administration of medication (eg, timing with food, supplements, and other medications), lifestyle and dietary changes that will have a beneficial impact on Paget's disease, possible side effects, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsSerum calcium, alkaline phosphatase

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. In order to be effective, this medication must be taken with a full glass of water (6-8 oz) at least 2 hours before or 2 hours after food. Do not take aspirin, antacids, or vitamin-mineral supplements containing calcium, magnesium, or aluminum within 2 hours of this medication. Do not remove medication from foil strip until ready to be used. Consult prescriber to determine recommended lifestyle changes (eg, decreased smoking, decreased alcohol intake, dietary supplements). Certain dental procedures should be avoided if possible while you are taking this medication; consult prescriber. Notify prescriber at once if experiencing any difficulty swallowing, pain when swallowing, or severe or persistent heartburn. You may experience mild/temporary skin rash, abdominal pain, or constipation (report if persistent). Report persistent muscle or bone pain; leg cramps; chest pain, palpitations, or swollen extremities; disturbed vision; ringing in the ears; unusual weakness; or significantly increased perspiration. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, tiludronic acid:

Skelid®: 200 mg [equivalent to 240 mg tiludronate disodium]

Generic AvailableNo

ManufacturerSanofi-Aventis Pharmaceuticals

Mechanism of ActionInhibition of normal and abnormal bone resorption. Inhibits osteoclasts through at least two mechanisms: disruption of the cytoskeletal ring structure, possibly by inhibition of protein-tyrosine-phosphatase, thus leading to the detachment of osteoclasts from the bone surface area and the inhibition of the osteoclast proton pump.

Pharmacodynamics/Kinetics

Onset of action: Delayed, may require several weeks

Absorption: Rapid

Distribution: Widely to bone and soft tissue

Protein binding: ~90%, primarily to albumin

Metabolism: Little, if any

Bioavailability: ~6% (range: 2% to 11%); reduced by 90% when given with food

Half-life elimination: Healthy volunteers: Single dose: 50 hours; Cl_{cr} 11-18 mL/minute: 205 hours; Pagetic patients: Repeated dosing: 150 hours

Time to peak, plasma: Within 2 hours

Excretion: Urine (~60%, as tiludronic acid within 13 days)

Dental Health Professional ConsiderationsThere is no data on the incidence of ONJ associated with use of tiludronate. A report by the Council of Scientific Affairs of the American Dental Association (accessed at: http://www.ada.org/prof/resources/topics/osteonecrosis.asp) as of July 2006 gave an estimated incidence of 0.7 cases for every 100,000 person-years of exposure to alendronate (Fosamax®). This translates to one case for every 142,857 person-years exposure. This figure from the ADA report was based on information received from Merck & Co citing 170 worldwide cases for alendronate (Fosamax®). In addition, Procter & Gamble Pharmaceuticals has cited 20 cases for risedronate (Actonel®) and Roche Laboratories has cited one case for ibandronate (Boniva®).

Consumer Reports On Health stated that the risk of jaw bone osteoporosis due to alendronate (Fosamax®), risedronate (Actonel®), or ibandronate (Boniva®) taken to prevent osteoporosis is very low and is estimated to be one out of every 20,000 users. That report mentioned that tooth extraction or implants increase the risk of developing osteonecrosis in patients taking any of these drugs for osteoporosis. The report also recommended that patients should stop taking any of these oral drugs 1-2 months before and after such dental treatment. No evidence was presented to support this statement.

In terms of length of exposure to oral bisphosphonates prior to onset of ONJ, data from large population studies or controlled studies is lacking. A report by Marx et al, observed that of three cases of ONJ associated with Fosamax® exposure, one patient had been taking 10 mg/day by mouth for 6 years and the other two patients 10 mg/day by mouth for 3 and 2 years respectively. In contrast, they observed that in cancer patients receiving intravenous bisphosphonates, the time period between the first doses of the bisphosphonate to first recognition of exposed bone either by the patients or by the clinician, was 9.4 months for zoledronate (Zometa®), 14.3 months for pamidronate (Aredia®), and 12.1 months for pamidronate then to zoledronate.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, anxiety, or nervousness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTiludronate Disodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Timolol may be confused with atenolol, Tylenol®

Timoptic® may be confused with Betoptic® S, Talacen®, Viroptic®

Bottle cap color change:

Timoptic®: Both the 0.25% and 0.5% strengths are now packaged in bottles with yellow caps; previously, the color of the cap on the product corresponded to different strengths.

International issues:

Betimol® may be confused with Betanol® which is a brand name for metipranolol in Monaco

Pronunciation(TIM oh lol)

U.S. Brand NamesBetimol®; Istalol®; Timolol GFS; Timoptic-XE®; Timoptic®; Timoptic® in OcuDose®

Canadian Brand NamesAlti-Timolol; Apo-Timol®; Apo-Timop®; Gen-Timolol; Nu-Timolol; Phoxal-timolol; PMS-Timolol; Sandoz-Timolol; Tim-AK; Timoptic-XE®; Timoptic®

Pharmacologic CategoryBeta Blocker, Nonselective; Ophthalmic Agent, Antiglaucoma

Use: Labeled Indications

Ophthalmic: Treatment of elevated intraocular pressure such as glaucoma or ocular hypertension

Oral: Treatment of hypertension and angina; to reduce mortality following myocardial infarction; prophylaxis of migraine

Dosing: Adults

Glaucoma: Ophthalmic:

Solution: Initial: 0.25% solution, instill 1 drop twice daily into affected eye(s); increase to 0.5% solution if response not adequate; decrease to 1 drop/day if controlled; do not exceed 1 drop twice daily of 0.5% solution.

Istalol®: Instill 1 drop (0.5% solution) once daily in the morning.

Gel-forming solution (Timolol GFS, Timoptic-XE®): Instill 1 drop (either 0.25% or 0.5%) once daily

Hypertension: Oral: Initial: 10 mg twice daily, increase gradually every 7 days, usual dosage: 20-40 mg/day in 2 divided doses; maximum: 60 mg/day.

Prevention of myocardial infarction: Oral: 10 mg twice daily initiated within 1-4 weeks after infarction.

Migraine prophylaxis: Oral: Initial: 10 mg twice daily, increase to maximum of 30 mg/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren: Ophthalmic: Refer to adult dosing.

Administration: OtherOphthalmic: Administer other topically-applied ophthalmic medications at least 10 minutes before Timoptic-XE®; wash hands before use; invert closed bottle and shake once before use; remove cap carefully so that tip does not touch anything; hold bottle between thumb and index finger; use index finger of other hand to pull down the lower eyelid to form a pocket for the eye drop and tilt head back; place the dispenser tip close to the eye and gently squeeze the bottle to administer 1 drop; remove pressure after a single drop has been released; **do not allow the dispenser tip to touch the eye**; replace cap and store bottle in an upright position in a clean area; do **not** enlarge hole of dispenser; do **not** wash tip with water, soap, or any other cleaner. Some ophthalmic solutions contain benzalkonium chloride; wait at least 10 minutes after instilling solution before inserting soft contact lenses.

Dietary ConsiderationsOral product should be administered with food at the same time each day.

StorageOphthalmic drops: Store at room temperature; do not freeze. Protect from light.

Timolol GFS: Store at 2°C to 25°C (36°F to 77°F). Protect from light.

Timoptic® in OcuDose®: Store in the protective foil wrap and use within 1 month after opening foil package.

ContraindicationsHypersensitivity to timolol or any component of the formulation; sinus bradycardia; sinus node dysfunction; heart block greater than first degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; uncompensated cardiac failure;

bronchospastic disease; pregnancy (2nd and 3rd trimesters)

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See “Other warnings/precautions” below.

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure: Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; can worsen.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.
- Renal impairment: Use with caution in patients with severe renal impairment; marked hypotension can occur in patients maintained on hemodialysis.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Contact lens wearers: Some product do contain benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.

Dosage form specific issues:

- Ophthalmic: Systemic absorption and adverse effects may occur, including bradycardia and/or hypotension. Should not be used alone in angle-closure glaucoma (has no effect on pupillary constriction). Multidose vials have been associated with development of bacterial keratitis; avoid contamination.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.**

Geriatric ConsiderationsSince bioavailability increased in about twofold in elderly patients, geriatrics may require lower maintenance doses. Also, as serum and tissue concentrations increase beta$_1$ selectivity diminishes. Beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults due to alterations in the beta-adrenergic autonomic system. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults. Due to propranolol's CNS penetration and nonselective action, it may not be the beta-blocker of choice for use in elderly.

Pregnancy Risk FactorC (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy ConsiderationsTimolol was shown to cross the placenta in an *in vitro* perfusion study. Beta-blockers have been associated with bradycardia, hypotension, hypoglycemia, and intrauterine growth rate (IUGR); IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Bradycardia and arrhythmia have been reported in an infant following ophthalmic administration of timolol during pregnancy.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsTimolol is excreted in breast milk following oral and ophthalmic administration, and is considered compatible by the AAP. It is recommended that the infant be monitored for signs or symptoms of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse Reactions

Ophthalmic:

>10%: Ocular: Burning, stinging

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Headache

Ocular: Blepharitis, blurred vision, cataract, conjunctival injection, conjunctivitis, foreign body sensation, hyperemia, itching, tearing, visual acuity decreased

Miscellaneous: Infection

Systemic:

1% to 10%:

Cardiovascular: Bradycardia

Central nervous system: Fatigue, dizziness

Respiratory: Dyspnea

Frequency not defined (reported with any dosage form):

Cardiovascular: Angina pectoris, arrhythmia, bradycardia, cardiac arrest, cardiac failure, cerebral ischemia, cerebral vascular accident, edema, heart block, hypotension, palpitation, Raynaud's phenomenon

Central nervous system: Anxiety, confusion, depression, disorientation, dizziness, hallucinations, insomnia, memory loss, nervousness, nightmares, somnolence

Dermatologic: Alopecia, angioedema, pseudopemphigoid, psoriasiform rash, psoriasis exacerbation, rash, urticaria

Endocrine & metabolic: Hypoglycemia masked, libido decreased

Gastrointestinal: Anorexia, diarrhea, dyspepsia, nausea, xerostomia

Genitourinary: Impotence, retoperitoneal fibrosis

Hematologic: Claudication

Neuromuscular & skeletal: Myasthenia gravis exacerbation, paresthesia

Ocular: Corneal sensitivity decreased, cystoid macular edema, diplopia, dry eyes, keratitis, ocular discharge, ocular pain, ptosis, refractive changes, visual disturbances

Otic: Tinnitus

Respiratory: Bronchospasm, cough, dyspnea, nasal congestion, pulmonary edema, respiratory failure

Miscellaneous: Allergic reactions, cold hands/feet, Peyronie's disease, systemic lupus erythematosus

Metabolism/Transport Effects **Substrate** of CYP2D6 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, apical and radial pulses, fluid I & O, daily weight, respirations, mental status, and circulation in extremities before and during therapy; monitor for systemic effect of beta-blockade even when administering ophthalmic product

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness (according to purpose of therapy) and adverse reactions at beginning of therapy and regularly with long-term therapy. Monitor blood pressure periodically. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationOral: Take exact dose prescribed; do not increase, decrease, or discontinue dosage without consulting prescriber. Take at the same time each day. If you have diabetes, monitor serum glucose closely. May cause postural hypotension (use caution when rising from sitting or lying position or climbing stairs); dizziness, drowsiness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); decreased sexual ability (reversible); or nausea or vomiting (small frequent meals or frequent mouth care may help). Report swelling of extremities, respiratory difficulty, or new cough; weight gain (>3 lb/week); unresolved diarrhea or vomiting; or cold blue extremities. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Ophthalmic: For ophthalmic use only. Apply prescribed amount as often as directed. Wash hands before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Tilt head back and look upward. Gently pull down lower lid and put drop(s) inside lower eyelid at inner corner. Close eye and roll eyeball in all directions. Do not blink for $^1/_2$ minute. Apply gentle pressure to inner corner of eye for 30 seconds. Wipe away excess from skin around eye. Do not use any other eye preparation for at least 10 minutes. Do not share medication with anyone else. Temporary stinging or blurred vision may occur. If using Istalol®, remove contact lenses prior to administration. Lenses may be reinserted 15 minutes following administration. Immediately report any adverse cardiac or CNS effects (usually signifies overdose). Report persistent eye pain, redness, burning, watering, dryness, double vision, puffiness around eye, vision changes, other adverse eye response, worsening of condition or lack of improvement.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Note: Unless otherwise specified, strength expressed as base.

Gel-forming solution, ophthalmic, as maleate:

Timolol GFS: 0.25% (2.5 mL, 5 mL); 0.5% (2.5 mL, 5 mL)

Timoptic-XE®: 0.25% (5 mL); 0.5% (5 mL)

Solution, ophthalmic, as hemihydrate:

Betimol®: 0.25% (5 mL, 10 mL [DSC], 15 mL [DSC]); 0.5% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Solution, ophthalmic, as maleate: 0.25% (5 mL, 10 mL, 15 mL); 0.5% (5 mL, 10 mL, 15 mL)

Istalol®: 0.5% (10 mL) [contains benzalkonium chloride and potassium sorbate]

Timoptic®: 0.25% (5 mL); 0.5% (5 mL, 10 mL) [contains benzalkonium chloride]

Solution, ophthalmic, as maleate [preservative free]:

Timoptic® in OcuDose®: 0.25% (0.2 mL); 0.5% (0.2 mL)

Tablet, as maleate: 5 mg, 10 mg, 20 mg [strength expressed as salt]

Generic AvailableYes: Excludes hemihydrate ophthalmic solutions. gel-forming ophthalmic solutions, and preservative free maleate ophthalmic solutions

Mechanism of ActionBlocks both beta$_1$- and beta$_2$-adrenergic receptors, reduces intraocular pressure by reducing aqueous humor production or possibly outflow; reduces blood pressure by blocking adrenergic receptors and decreasing sympathetic outflow, produces a negative chronotropic and inotropic activity through an unknown mechanism

Pharmacodynamics/Kinetics

Onset of action:

Hypotensive: Oral: 15-45 minutes

Peak effect: 0.5-2.5 hours

Intraocular pressure reduction: Ophthalmic: 30 minutes

Peak effect: 1-2 hours

Duration: ~4 hours; Ophthalmic: Intraocular: 24 hours

Protein binding: 60%

Metabolism: Extensively hepatic; extensive first-pass effect

Half-life elimination: 2-2.7 hours; prolonged with renal impairment

Excretion: Urine (15% to 20% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Timolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsEpinephrine has interacted with nonselective beta-blockers such as propranolol to result in initial hypertensive episode followed by bradycardia. Timolol is also a nonselective beta-blocker. Timolol is available as an eye drop and oral dose form. When administered as an eye drop, the significance of a potential systemic interaction with epinephrine is unknown. However, it is suggested that cautionary procedures be used, particularly if vasoconstrictor is used immediately following an ophthalmic dose of timolol taken by the patient. If patients are taking the oral form of timolol, then the significance of a potential systemic interaction is well known and cautionary use of epinephrine is advised.

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause anxiety, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease the effects of beta-blockers

Cardiovascular ConsiderationsIt is important to recognize that timolol eye drops may have systemic effects, particularly when patients are also on oral beta-blocker therapy or therapy with other negative chronotropic agents.

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of chronic stable angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

ST-Segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension or a tachyarrhythmia (Class IIa recommendation).

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines update on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul, 2006; Yang, 2006).

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tye NI da zole)

U.S. Brand NamesTindamax®

Pharmacologic CategoryAmebicide; Antibiotic, Miscellaneous; Antiprotozoal, Nitroimidazole

Use: Labeled IndicationsTreatment of trichomoniasis caused by *T. vaginalis*; treatment of giardiasis caused by *G. duodenalis* (*G. lamblia*); treatment of intestinal amebiasis and amebic liver abscess caused by *E. histolytica*; treatment of bacterial vaginosis caused by *Bacteroides* spp, *Gardnerella vaginalis*, and *Prevotella* spp in nonpregnant females

Dosing: Adults

Amebiasis, intestinal: Oral: 2 g/day for 3 days

Amebiasis, liver abscess: Oral: 2 g/day for 3-5 days

Bacterial vaginosis: 2 g/day for 2 days or 1 g/day for 5 days

Giardiasis: Oral: 2 g as a single dose

Trichomoniasis: Oral: 2 g as a single dose; sexual partners should be treated at the same time

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Amebiasis, intestinal: Oral: Children >3 years: 50 mg/kg/day for 3 days (maximum dose: 2 g/day)

Amebiasis, liver abscess: Oral: Children >3 years: 50 mg/kg/day for 3-5 days (maximum dose: 2 g/day)

Giardiasis: Oral: Children >3 years: 50 mg/kg as a single dose (maximum dose: 2 g)

Dosing: Renal ImpairmentAdjustment not necessary. An additional dose equal to $^{1}/_{2}$ the usual dose, should be administered at the end of hemodialysis if tinidazole is administered on a day hemodialysis occurs.

Dosing: Hepatic ImpairmentSpecific recommendations are not available; use with caution.

Administration: OralAdminister with food.

Dietary ConsiderationsTake with food. The manufacturer recommends that ethanol be avoided during treatment and for 3 days after therapy is complete.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

Extemporaneously PreparedTo prepare an oral suspension: Grind four 500 mg tablets to a fine powder. Add cherry syrup 10 mL and mix until smooth. Transfer to a graduated container, rinsing mortar with a small amount of cherry syrup to remove any remaining medication. Add additional cherry syrup to q.s. to 30 mL. Suspension is stable for 7 days at room temperature. Shake well before using.

ContraindicationsHypersensitivity to tinidazole, nitroimidazole derivatives (including metronidazole), or any component of the formulation; pregnancy (1st trimester); breast-feeding

Allergy Considerations

- Nitroimidazole Allergy

Warnings/Precautions

Boxed warnings:

- Carcinogenicity: See “Concerns related to adverse effects” below

Concerns related to adverse effects:

- Carcinogenicity: [**U.S. Boxed Warning]: Carcinogenicity has been observed with another nitroimidazole derivative (metronidazole) in animal studies;** use should be reserved for approved indications only.

- CNS effects: Seizures and peripheral neuropathy have been reported with tinidazole and other nitroimidazole derivatives; use with caution in patients with CNS diseases.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD), pseudomembranous colitis, and/or vaginal candidiasis. CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Amebiasis: Appropriate use: When used for amebiasis, not indicated for the treatment of asymptomatic cyst passage.

- Blood dyscrasias: Use with caution in patients with current or a history of blood dyscrasias.

- Hepatic impairment: Use with caution in patients with current or a history of hepatic impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤3 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTinidazole crosses the placenta and enters the fetal circulation. Teratogenic effects have not been observed in animal studies. Should not be used during pregnancy for the treatment of bacterial vaginosis. Use during the first trimester is contraindicated; use during the 2nd and 3rd trimester only if clearly needed.
LactationEnters breast milk/contraindicated
Breast-Feeding ConsiderationsBreast-feeding should be discontinued during therapy and for 3 days after the last dose.
Adverse Reactions

1% to 10%:

Central nervous system: Fatigue/malaise (1% to 2%), dizziness (≤1%), headache (≤1%)

Endocrine & metabolic: Menorrhagia (>2%)

Gastrointestinal: Metallic/bitter taste (4% to 6%), nausea (3% to 5%), anorexia (2% to 3%), appetite decreased (>2%), flatulence (>2%), dyspepsia/cramps/epigastric discomfort (1% to 2%), vomiting (1% to 2%), constipation (≤1%)

Genitourinary: *Candida* vaginitis (5%), painful urination (>2%), pelvic pain (>2%), urine abnormality (>2%), vaginal odor (>2%), vulvovaginal discomfort (>2%)

Neuromuscular & skeletal: Weakness (1% to 2%)

Renal: Urinary tract infection (>2%)

Respiratory: Upper respiratory tract infection (>2%)

Frequency not defined.

Cardiovascular: Flushing, palpitation

Central nervous system: Ataxia, coma (rare), confusion (rare), depression (rare), drowsiness, fever, giddiness, insomnia, seizure, vertigo

Dermatologic: Angioedema, pruritus, rash, urticaria

Gastrointestinal: Abdominal pain, diarrhea, furry tongue (rare), oral candidiasis, salivation, stomatitis, thirst, tongue discoloration, xerostomia

Genitourinary: Urine darkened, vaginal discharge increased

Hematologic: Leukopenia (transient), neutropenia (transient), thrombocytopenia (reversible; rare)

Hepatic: Transaminases increased

Neuromuscular & skeletal: Arthralgia, arthritis, myalgia, peripheral neuropathy (transient, includes numbness and paresthesia)

Respiratory: Bronchospasm (rare), dyspnea (rare), pharyngitis (rare)

Miscellaneous: Burning sensation, *Candida* overgrowth, diaphoresis

Postmarketing and/or case reports: Acute hypersensitivity reaction (severe), erythema multiforme, Stevens-Johnson syndrome

Metabolism/Transport Effects**Substrate** of CYP3A4 (major), 2B6 (minor)
Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Ethanol: The manufacturer recommends to avoid all ethanol or any ethanol-containing drugs (may cause disulfiram-like reaction characterized by flushing, headache, nausea, vomiting, sweating or tachycardia) during and for at least 3 days after completion of treatment.

Food: Peak antibiotic serum concentration lowered and delayed, but total drug absorbed not affected.

Test InteractionsMay interfere with AST, ALT, triglycerides, glucose, and LDH testing
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic effectiveness (symptoms and laboratory tests) and adverse response. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report
Patient EducationDo not take any new medications during therapy without consulting prescriber. Take exactly as directed. Avoid all alcohol while taking this medication and for 3 days following completion; may cause unpleasant reaction (flushing, nausea, vomiting, sweating, headache, rapid heart beat). Refrain from sexual intercourse or use contraceptive if being treated for trichomoniasis. May cause headache, drowsiness or dizziness (use caution when climbing stairs, driving, or engaged in potentially hazardous tasks until response to drug is known); mild gastrointestinal disturbance (nausea, vomiting, constipation, diarrhea, metallic/bitter taste, abdominal discomfort) small frequent meals, frequent mouth care, chewing gum or sucking lozenges may help. Report severe fatigue or weakness; chest pain or palpitations; swelling of lips or mouth, other persistent adverse reactions, lack of improvement or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is contraindicated.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]:

Tindamax®: 250 mg, 500 mg

Generic AvailableNo

ManufacturerMission Pharmacal Company

Pricing: U.S. (www.drugstore.com)

Tablets (Tindamax)

250 mg (40): $89.99

Mechanism of ActionAfter diffusing into the organism, it is proposed that tinidazole causes cytotoxicity by damaging DNA and preventing further DNA synthesis.

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: V_d: 50 L

Protein binding: 12%

Metabolism: Hepatic via CYP3A4 (primarily); undergoes oxidation, hydroxylation and conjugation; forms a metabolite

Half-life elimination: 13 hours

Time to peak, plasma: 1.6 hours

Excretion: Urine (20% to 25%); feces (12%)

Dental Health Professional ConsiderationsAlthough this drug is a member of the metronidazole family, there is no specific dental indication for its use. Just as with metronidazole, alcohol in any form is contraindicated while the patient is on this medication because of the danger of a disulfiram-type reaction.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), metallic/bitter taste, oral candidiasis, tongue discoloration, stomatitis, furry tongue. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, malaise, ataxia, confusion, depression, giddiness, insomnia, and seizures

Mental Health: Effects on Psychiatric TreatmentBromocriptine, fluvoxamine, and nefazodone may increase levels of tinidazole; barbiturates, carbamazepine, oxcarbazepine, phenytoin, and fosphenytoin may decrease levels of tinidazole; monitor

Special Alerts

Tinzaparin (Innohep®): Preliminary Results of Clinical Study Showing an Increase in All-Cause Mortality - December 2008; Updated December 31, 2008

The Food and Drug Administration (FDA) is communicating information to healthcare professionals regarding the clinical trial *Innohep® in Renal Insufficiency Study (IRIS)*. This multicenter European trial was prematurely halted in February 2008 after interim results showed an increase in all-cause mortality in patients receiving tinzaparin compared to patients receiving unfractionated heparin (UFH) in the treatment of deep vein thromboses (DVT) and/or pulmonary embolism (PE). Patients in the study were ≥70 years of age with impaired renal function and had a confirmed diagnosis of DVT and/or PE. Of the 350 patients completing 90 days of follow-up when the study was stopped, 23 of the 176 patients (13%) receiving tinzaparin died, compared to 9 of the 174 patients (5%) treated with UFH. According to the FDA, there is no clear pattern in the cause of death and it does not appear to be dose related (under- or overdosing). In addition, results do not appear to be attributed to a manufacturing issue with either agent.

In light of the IRIS preliminary data, the FDA is advising healthcare professionals to consider the use of alternative agents to tinzaparin in the treatment of DVT and/or PE in elderly patients >70 years of age with renal impairment. Of note, prescribing information for Innohep® was updated in July 2008, restricting its use in patients ≥90 years of age. The FDA is now requesting the manufacturer revise prescribing information to include the IRIS study results which suggest the risk of mortality may not be limited to only patients ≥90 years of age.

The FDA has issued an update (December 31, 2008) to the previous MedWatch alert informing practitioners that Celgene Pharmaceuticals has distributed a “Dear Healthcare Professional” letter concerning the issue and has also revised the prescribing information for Innohep®. The labeling now includes a warning that tinzaparin may increase the risk of death in elderly patients with renal insufficiency compared to UFH, and recommends considering alternatives when treating these patients for DVT and/or PE. The labeling also includes details of the IRIS study and defines the patient population involved (patients ≥70 years of age with Cl_{cr} ≤30 mL/minute or patients ≥75 years of age with Cl_{cr} ≤60 mL/minute).

The final IRIS study report is expected to be submitted in January 2009, and after the review is complete, the FDA will communicate its conclusions and any further recommendations.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Innohep

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

2009 National Patient Safety Goals: The Joint Commission on Accreditation of Healthcare Organizations requires healthcare organizations that provide anticoagulant therapy to have a process in place to reduce the risk of anticoagulant-associated patient harm. Patients receiving anticoagulants should receive individualized care through a defined process that includes standardized ordering, dispensing, administration, monitoring and education. This does not apply to routine short-term use of anticoagulants for prevention of venous thromboembolism when the expectation is that the patient’s laboratory values will remain within or close to normal values (NPSG.03.05.01).

Pronunciation(tin ZA pa rin)

U.S. Brand NamesInnohep®

Canadian Brand NamesInnohep®

Pharmacologic CategoryLow Molecular Weight Heparin

Use: Labeled IndicationsTreatment of acute symptomatic deep vein thrombosis, with or without pulmonary embolism, in conjunction with warfarin sodium

Dosing: Adults

DVT with or without pulmonary embolism (PE): SubQ: 175 anti-Xa int. units/kg of body weight once daily. The 2008 *Chest* guidelines recommend starting warfarin on the first treatment day and continuing tinzaparin until INR is between 2 and 3 (usually 5-7 days). Administer tinzaparin for at least 5 days and until INR ≥2 for at least 24 hours (Hirsh, 2008).

Note: To calculate the volume of solution to administer per dose: Volume to be administered (mL) = patient weight (kg) x 0.00875 mL/kg (may be rounded off to the nearest 0.05 mL)

Dosing adjustment in obesity: Weight based dosing (175 anti-Xa int. units/kg of body weight once daily) provided in product labeling for patients up to 162 kg. Limited clinical experience in patients with a BMI >40 kg/m^2.

Dosing: ElderlyRefer to adult dosing. Increased sensitivity to tinzaparin in elderly patients may be possible due to a decline in renal function. Increased all-cause mortality noted in patients ≥70 years of age with Cl_{cr} ≤30 mL/minute or ≥75 years of age and Cl_{cr} ≤60 mL/minute; consider alternative treatments in these patients.

Dosing: Renal Impairment

Cl_{cr} ≤50 mL/minute: Use with caution; clearance is decreased.

Cl_{cr} <30 mL/minute: Per manufacturer's labeling, use with caution. The 2008 *Chest* guidelines recommend avoiding use (in patients requiring therapeutic anticoagulation); if used, consider monitoring anti-Xa levels (Hirsh, 2008).

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: OtherPatient should be lying down or sitting. Administer by deep SubQ injection, alternating between the left and right anterolateral and left and right posterolateral abdominal wall. Vary site daily. The entire needle should be introduced into the skin fold formed by the thumb and forefinger. Hold the skin fold until injection is complete. To minimize bruising, do not rub the injection site.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to tinzaparin sodium, heparin, or any component of the formulation; active major bleeding; heparin-induced thrombocytopenia (current or history of)

Allergy Considerations

- Low Molecular Weight Heparin Allergy

Warnings/Precautions

Boxed warnings:

- Neuraxial anesthesia: See "Other warnings/precautions" below.

Disease-related concerns:

- Renal impairment: Patients with severe renal impairment may show reduced elimination of tinzaparin. An increased risk of death has been observed in elderly patients with renal impairment.

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding. Risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; severe uncontrolled hypertension; history of hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmology surgery; in patient treated concomitantly with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients undergoing invasive procedures. Discontinue if bleeding occurs.

- Hyperkalemia: Monitor for hyperkalemia. Heparin can cause hyperkalemia by suppressing aldosterone production; similar reactions could occur with LMWHs. Most commonly occurs in patients with risk factors for the development of hyperkalemia (eg, renal dysfunction, concomitant use of potassium-sparing diuretics or potassium supplements, hematoma in body tissues).

- Thrombocytopenia: Rare cases of thrombocytopenia have occurred. Contraindicated in patients with history of heparin-induced thrombocytopenia; monitor platelet count closely. Manufacturer recommends discontinuation of therapy if platelets are <100,000/mm^3. Rare cases of thrombocytopenia with thrombosis have occurred. Use caution in patients with congenital or drug-induced thrombocytopenia or platelet defects.

- Renal impairment: Reduced tinzaparin clearance was observed in patients with moderate renal impairment (Cl_{cr} ≤50 mL/minute); patients with severe renal impairment (Cl_{cr} <30 mL/minute) had a 24% decrease in clearance. Use with caution in patients with renal insufficiency or avoid use, particularly in patients of advanced age with concomitant renal impairment. The 2008 *Chest* guidelines recommend that patients with Cl_{cr} <30 mL/minute be treated with unfractionated heparin instead of LMWH (Hirsh, 2008).

Special populations:

- Elderly: Use with caution in the elderly; delayed elimination may occur. Use in patients ≥70 years of age with renal insufficiency (Cl_{cr} ≤30 mL/minute or ≥75 years of age and Cl_{cr} ≤60 mL/minute) has been associated with an increased risk of death compared to use of unfractionated heparin; consider alternative treatments in these patients.

- Obese patients: Clinical experience is limited in patients with BMI >40 kg/m^2.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Benzyl alcohol: This product contains benzyl alcohol and should be used with caution in pregnant women. In neonates, large amounts of benzyl alcohol (>100 mg/kg/day) have been associated with fatal toxicity (gasping syndrome).

- Porcine intestinal mucosa: This product is derived from porcine intestinal mucosa and should not be used in patients allergic to pork products.

- Sodium metabisulfite: This product contains sodium metabisulfite which may cause allergic-type reactions, including anaphylactic symptoms and life-threatening asthmatic episodes in susceptible people; this is seen more frequently in asthmatics.

Other warnings/precautions:

- Administration: For subcutaneous use only; do not administer intramuscularly or intravenously.

- Conversion to other products: Not to be used interchangeably (unit for unit) with heparin or any other low molecular weight heparins.

- Neuraxial anesthesia: **[U.S. Boxed Warning]: Patients with recent or anticipated neuraxial anesthesia (epidural or spinal anesthesia) are at risk of spinal or epidural hematoma and subsequent paralysis.** Consider risk versus benefit prior to neuraxial anesthesia; risk is increased by concomitant agents which may alter hemostasis, as well as traumatic or repeated epidural or spinal puncture. Patient should be observed closely for bleeding and signs and symptoms of neurological impairment if therapy is administered during or immediately following diagnostic lumbar puncture, epidural anesthesia, or spinal anesthesia.

Geriatric ConsiderationsNo significant differences in safety or response were seen when used in patients ≥65 years of age. However, increased sensitivity to tinzaparin in elderly patients may be possible due to a decline in renal function. Results from the Innohep in Renal Insufficiency Study (IRIS) study showed an increased in all-cause mortality in elderly patients receiving tinzaparin compared to unfractionated heparin for treatment of DVT and/or PE. The at-risk population has defined as patients ≥70 years of age with $Cl_{cr} \le 30$ mL/minute or ≥75 years of age and $Cl_{cr} \le 60$ mL/minute.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic events were not observed in animal studies. Tinzaparin does not cross the human placenta. A pharmacokinetic study in pregnant women found no dose adjustment was needed during pregnancy. Pregnancy may increase the risk of thromboembolism; risk may be further increased with certain pre-existing conditions. As with all anticoagulants, bleeding is the major adverse effect of tinzaparin. Vaginal bleeding was reported in ~10% of pregnant patients during tinzaparin therapy. Contains benzyl alcohol; use with caution in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAs with all anticoagulants, bleeding is the major adverse effect of tinzaparin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables.

>10%:

Hepatic: ALT increased (13%)

Local: Injection site hematoma (16%)

1% to 10%:

Cardiovascular: Angina pectoris, chest pain (2%), hyper-/hypotension, tachycardia

Central nervous system: Confusion, dizziness, fever (2%), headache (2%), insomnia, pain (2%)

Dermatologic: Bullous eruption, pruritus, rash (1%), skin disorder

Gastrointestinal: Constipation (1%), dyspepsia, flatulence, nausea (2%), nonspecified gastrointestinal disorder, vomiting (1%)

Genitourinary: Dysuria, urinary retention, urinary tract infection (4%)

Hematologic: Anemia, hematoma, hemorrhage (2%), thrombocytopenia (1%)

Hepatic: AST increased (9%)

Local: Thrombophlebitis (deep)

Neuromuscular & skeletal: Back pain (2%)

Renal: Hematuria (1%)

Respiratory: Dyspnea (1%), epistaxis (2%), pneumonia, pulmonary embolism (2%), respiratory disorder

Miscellaneous: Impaired healing, infection, unclassified reactions

<1%: Abdominal pain, diarrhea, major bleeding

Additional serious adverse reactions reported in clinical trials and postmarketing experience: Abscess, acute febrile reaction, agranulocytosis, allergic purpura, allergic reaction, angioedema, anaphylactoid reaction, anorectal bleeding, cardiac arrhythmia, cellulitis, cerebral hemorrhage, cholestatic hepatitis, coronary thrombosis, dependent edema, epidermal necrolysis, erythematous gastrointestinal hemorrhage, granulocytopenia, hemarthrosis, hematemesis, hemoptysis, injection site bleeding, intracranial hemorrhage, ischemic necrosis, melena, MI, necrosis, neoplasm, ocular hemorrhage, pancytopenia, peripheral ischemia, priapism, purpura, rash, retroperitoneal/intra-abdominal bleeding, severe thrombocytopenia, skin necrosis, spinal epidural hematoma, Stevens-Johnson syndrome, thromboembolism, urticaria, vaginal hemorrhage, wound hematoma

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Heparin (Low Molecular Weight) may enhance the adverse/toxic effect of Drotrecogin Alfa. This is of most concern with therapeutic doses of LMW heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Monitoring ParametersCBC including platelet count and hematocrit or hemoglobin, and stool for occult blood; the monitoring of PT and/or aPTT is not of clinical value. Patients receiving both warfarin and tinzaparin should have their INR drawn just prior to the next scheduled dose of tinzaparin.

According to 2008 *Chest* guidelines, routine monitoring of anti-Xa levels is generally not recommended; however, anti-Xa levels may be beneficial in certain patients (eg, obese patients, patients with severe renal insufficiency receiving therapeutic doses, and possibly pregnant women receiving therapeutic doses; Hirsh, 2008)

Nursing: Physical Assessment/MonitoringUse caution in the presence of increased risk of bleeding. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (especially anything that will impact coagulation or platelet aggregation). Assess results of laboratory tests on a regular basis. Monitor therapeutic effectiveness and adverse response (eg, bleeding at any source, rash, angina, confusion, urinary retention, dyspnea). Observe and teach bleeding precautions. Teach patient use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions (eg, bleeding precautions), and adverse symptoms to report.

Monitoring: Lab TestsCBC including platelet count and hematocrit or hemoglobin, and stool for occult blood; the monitoring of PT and/or PTT is not of clinical value. Patients receiving both warfarin and tinzaparin should have their INR drawn just prior to the next scheduled dose of tinzaparin.

According to 2008 *Chest* guidelines, routine monitoring of anti-Xa levels is generally not recommended; however, anti-Xa levels may be beneficial in certain patients (eg, obese patients, patients with severe renal insufficiency receiving therapeutic doses, and possibly pregnant women receiving therapeutic doses; Hirsh, 2008)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by injection. If self-administered, use exactly as directed and follow instructions for syringe disposal. Do not alter dosage or discontinue without consulting prescriber. You may have a tendency to bleed easily while taking this drug (brush teeth with soft brush, use waxed dental floss, use electric razor, avoid scissors or sharp knives, and avoid potentially harmful activities). Report immediately any unusual bleeding or bruising (eg, mouth, nose, blood in urine or stool); chest pain or palpitations; confusion, dizziness, or headache; skin rash or itching; persistent GI upset (eg, nausea, vomiting, abdominal pain, acute constipation); warmth, swelling, pain, or redness in calves or other areas; back or muscle pain; respiratory difficulties; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium:

Innohep®: 20,000 anti-Xa int. units/mL (2 mL) [contains benzyl alcohol and sodium metabisulfite]

Generic AvailableNo

Mechanism of ActionStandard heparin consists of components with molecular weights ranging from 4000-30,000 daltons with a mean of 16,000 daltons. Heparin acts as an anticoagulant by enhancing the inhibition rate of clotting proteases by antithrombin III, impairing normal hemostasis and inhibition of factor Xa. Low molecular weight heparins have a small effect on the activated partial thromboplastin time and strongly inhibit factor Xa. The primary inhibitory activity of tinzaparin is through antithrombin. Tinzaparin is derived from porcine heparin that undergoes controlled enzymatic depolymerization. The average molecular weight of tinzaparin ranges between 5500 and 7500 daltons which is distributed as <2000 daltons (<10%), 2000-8000 daltons (60% to 72%), and >8000 daltons (22% to 36%). The anti-Xa activity is approximately 100 int. units/mg.

Pharmacodynamics/Kinetics

Onset of action: 2-3 hours

Distribution: 3-5 L

Half-life elimination: 3-4 hours

Metabolism: Partially metabolized by desulphation and depolymerization

Bioavailability: 87%

Time to peak: 4-5 hours

Excretion: Urine

Related Information

- Anticoagulants, Injectable

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, confusion, or dizziness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsLow molecular weight heparins (LMWHs) compare favorably to unfractionated heparin (UFH) in the prevention and treatment of venous thromboembolism. LMWHs are associated with less thrombocytopenia, compared to heparin, and do not require routine therapeutic monitoring. The role of tinzaparin in the treatment of acute coronary syndromes is not established.

Obesity/Renal Dysfunction: The 2008 *Chest* guidelines recommends that dosing (prophylaxis or treatment) in patients with obesity should be weight-based and not a fixed-dose regimen (Grade 2C; Hirsh, 2008). Tinzaparin offers weight-based dosing (up to 162 kg) in its package insert. One study evaluated weight-based dosing (single doses of 75 and 175 units/kg) in patients between 100 and 165 kg and demonstrated achievement of similar anti-Xa activity levels compared to normal-weight individuals (Hainer, 2002). Monitoring anti-Xa activity 4 hours after an injection may be warranted.

Patients who have a reduction in calculated creatinine clearance are at risk of an accumulated anticoagulant effect when they are treated with certain LMWHs. All LMWHs may not behave the same in patients with renal dysfunction due to differences in molecular weight distribution. Monitoring anti-Xa activity for patients with Cl_{cr} <30 mL/minute may be necessary. Elderly patients with diminished renal function (Cl_{cr} ≤30 mL/minute) should not be treated with tinzaparin. Of note, the 2008 *Chest* guidelines recommends that patients with Cl_{cr} <30 mL/minute who require therapeutic anticoagulation be treated with unfractionated heparin instead of LMWH (Grade 2C; Hirsh, 2008).

Index TermsTinzaparin Sodium

Medication Safety Issues

Sound-alike/look-alike issues:

Tioconazole may be confused with terconazole

Pronunciation(tye oh KONE a zole)

U.S. Brand Names1-Day™ [OTC]; Vagistat®-1 [OTC]

Pharmacologic CategoryAntifungal Agent, Vaginal

Use: Labeled IndicationsLocal treatment of vulvovaginal candidiasis

Dosing: Adults**Vulvovaginal candidiasis:** Vaginal: Insert 1 applicatorful in vagina, just prior to bedtime, as a single dose

Dosing: ElderlyRefer to adult dosing.

StorageStore at room temperature.

ContraindicationsHypersensitivity to tioconazole or any component of the formulation

Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: If irritation or sensitization occurs, discontinue use.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Petrolatum-based: Petrolatum-based vaginal products may damage rubber or latex condoms or diaphragms; separate use by 3 days.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Central nervous system: Headache

Gastrointestinal: Abdominal pain

Dermatologic: Burning, desquamation

Genitourinary: Discharge, dyspareunia, dysuria, irritation, itching, nocturia, vaginal pain, vaginitis, vulvar swelling

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2A6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate administration, possible side effects/interventions, and adverse symptoms to report.

Patient EducationConsult with prescriber if treating a vaginal yeast infection for the first time. Insert high into the vagina. Refrain from intercourse during treatment. May interact with condoms and vaginal contraceptive diaphragms (ie, weaken latex); do not rely on these products for 3 days following treatment. Do not use tampons, douches, spermicides, or other vaginal products during treatment. Although product is used for a single day, relief from symptoms usually takes longer than 1 day. Report persistent (>3 days) vaginal burning, irritation, or discharge. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, vaginal: 6.5% (4.6 g) [with applicator]

Generic AvailableNo

Mechanism of ActionA 1-substituted imidazole derivative with a broad antifungal spectrum against a wide variety of dermatophytes and yeasts, including *Trichophyton mentagrophytes*, *T. rubrum*, *T. erinacei*, *T. tonsurans*, *Microsporum canis*, *Microsporum gypseum*, and *Candida albicans*. Both agents appear to be similarly effective against *Epidermophyton floccosum*.

Pharmacodynamics/Kinetics

Special Alerts

Tiotropium (Spiriva®): Ongoing Safety Evaluation of Stroke Risk - October 2008

The U.S. Food and Drug Administration (FDA) has received preliminary data from the UPLIFT (Understanding the Potential Long-Term Impacts on Function with Tiotropium) trial. The UPLIFT trial is an international trial randomizing ~6,000 COPD patients to 4 years of tiotropium or placebo. The primary endpoint determines if tiotropium reduces the rate of decline in lung function over time (Tashkin, 2008). A secondary endpoint evaluates tiotropium's safety profile, with attention on the risk of stroke (mortality caused by stroke and adverse events reported as stroke).

Two recent analyses (Lee, 2008; Singh, 2008) showed an association with inhaled anticholinergics and an increase risk of cardiovascular events in COPD patients. Preliminary evaluation of the UPLIFT trial data did not support an association between the use of tiotropium and an increased risk of stroke.

Based upon these results, the FDA is going to independently examine the data from the UPLIFT trial. The FDA expects to receive the complete report for UPLIFT in November 2008 and review the final results.

Additional information may be found at http://www.fda.gov/cder/drug/early_comm/tiotropium.htm

Tiotropium (Spiriva®): Possible Increased Risk of Stroke - March 2008

Boehringer Ingelheim and the U.S. Food and Drug Administration (FDA) are informing practitioners of preliminary results of an analysis indicating a possible increased risk of stroke associated with the use of Spiriva®. The results are based on pooled analysis performed on safety data from 29 placebo-controlled clinical trials involving approximately 13,500 patients with chronic obstructive pulmonary disease (COPD). The results revealed an estimate of the risk of stroke in 8 patients per 1000 patients per year treated with Spiriva® compared to the risk of stroke in 6 patients per 1000 patients per year with placebo.

These results have not been confirmed by the FDA. The FDA will further evaluate this potential association and provide more information as it is made available. Boehringer Ingelheim has conducted a large 4-year study that will provide additional long-term safety data and is expected to be available in the summer of 2008. Patients should not discontinue Spiriva® and should discuss any concerns with their healthcare provider.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Tiotropium .

Medication Safety Issues

Sound-alike/look-alike issues:

Spiriva® may be confused with Inspra™, Serevent®

Spiriva® capsules for inhalation are for administration via HandiHaler® device and are **not** for oral use

Pronunciation(ty oh TRO pee um)

U.S. Brand NamesSpiriva® HandiHaler®

Canadian Brand NamesSpiriva®

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled IndicationsMaintenance treatment of bronchospasm associated with COPD (bronchitis and emphysema)

Dosing: Adults**COPD:** Oral inhalation: Contents of 1 capsule (18 mcg) inhaled once daily using HandiHaler® device

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentPlasma concentrations increase in renal impairment. Use caution in moderate-severe impairment; no specific dosage adjustment recommended.

Administration: OralFor oral inhalation only. Capsule should not be swallowed.

Administration: InhalationAdminister once daily at the same time each day. Remove capsule from foil blister immediately before use. Capsule should not be swallowed. Place capsule in the capsule-chamber in the base of the HandiHaler® Inhaler. Must only use the HandiHaler® Inhaler. Close mouthpiece until a click is heard, leaving dustcap open. Exhale fully. Do not exhale into inhaler. Tilt head slightly back and inhale (rapidly, steadily and deeply); the capsule vibration may be heard within the device. Hold breath as long as possible. If any powder remains in capsule, exhale and inhale again. Repeat until capsule is empty. Throw away empty capsule; do not leave in inhaler. Do not use a spacer with the HandiHaler® Inhaler. Do not use HandiHaler® device for other medications. Always keep capsules and inhaler dry.

Delivery of dose: Instruct patient to place mouthpiece gently between teeth, closing lips around inhaler. Instruct patient to inhale deeply and hold breath held for 5-10 seconds. The amount of drug delivered is small, and the individual will not sense the medication as it is inhaled. Remove mouthpiece prior to exhalation. Patient should not breathe out through the mouthpiece.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Do not store capsules in HandiHaler® device. Capsules should be stored in the blister pack and only removed immediately before use. Once protective foil is peeled back and/or removed the capsule should be used immediately; if capsule is not used immediately it should be discarded.

ContraindicationsHypersensitivity to tiotropium, atropine or its derivatives, including ipratropium, or any component of the formulation (contains lactose)

Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported. Discontinue immediately if signs/symptoms occur.

Disease-related concerns:

- Asthma: Appropriate use: Not indicated for the initial (rescue) treatment of acute episodes of bronchospasm.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma.
- Myasthenia gravis/bladder neck obstruction: Use with caution in patients with myasthenia gravis.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia or bladder neck obstruction.
- Renal impairment: Use with caution in patients with moderate to severe renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: The contents of Spiriva® capsules are for inhalation only via the HandiHaler® device. Capsules should not be swallowed; there have been reports of incorrect administration (swallowing of the capsules).
- Avoid ocular contact: Avoid inadvertent instillation of powder into the eyes.

Geriatric ConsiderationsAssess patient's ability to use the HandiHaler®. In elderly patients, renal clearance of tiotropium was decreased and plasma concentrations were increased, due to decreased renal function. No significant difference in adverse effects were seen in young vs elderly patients. No dosage adjustments are recommended due to age or renal function. However, the manufacturer recommends monitoring patients with moderate-to-severe renal impairment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events (fetal loss, decreased birth weights, delayed sexual maturation) were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women. Use only when expected benefit to mother outweighs potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Gastrointestinal: Xerostomia (16%)

Respiratory: Upper respiratory tract infection (41% vs 37% with placebo), sinusitis (11% vs 9% with placebo)

1% to 10%:

Cardiovascular: Angina (1% to 7%), edema (dependent, 5%)

Central nervous system: Depression (1% to 3%), dysphonia (1% to 3%)

Dermatologic: Rash (4%)

Endocrine & metabolic: Hypercholesterolemia (1% to 3%), hyperglycemia (1% to 3%)

Gastrointestinal: Dyspepsia (6%), abdominal pain (5%), constipation (4%), vomiting (4%), gastroesophageal reflux (1% to 3%), ulcerative stomatitis (1% to 3%)

Genitourinary: Urinary tract infection (7%)

Neuromuscular & skeletal: Myalgia (4%), arthritis (≥3%), leg pain (1% to 3%), paresthesia (1% to 3%), skeletal pain (1% to 3%)

Ocular: Cataract (1% to 3%)

Respiratory: Pharyngitis (9%), rhinitis (6%), epistaxis (4%), cough (≥3%), laryngitis (1% to 3%)

Miscellaneous: Infection (4%), moniliasis (4%), flu-like syndrome (≥3%), allergic reaction (1% to 3%), herpes zoster (1% to 3%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Angioedema; application site irritation (glossitis, mouth ulceration, pharyngolaryngeal pain); atrial fibrillation, blurred vision, candidiasis (oral), dizziness, dysphagia, glaucoma, hoarseness, hypersensitivity reactions, ileus (paralytic), intestinal obstruction, intraocular pressure increased, palpitation, paradoxical bronchospasm, pruritus, pupil dilation (if powder comes in contact with eyes), stroke, supraventricular tachycardia, tachycardia, throat irritation, urinary difficulty, urinary retention, urticaria

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, 3A4

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Monitoring ParametersFEV$_1$, peak flow (or other pulmonary function studies)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescription or OTC medications or herbal products patient may be taking. Assess results of pulmonary tests prior to and periodically during therapy. Assess therapeutic effectiveness and adverse response at beginning of therapy and at regular intervals during therapy. Teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFEV$_1$, peak flow (or other pulmonary function studies)

Patient EducationUse inhaler and medication as instructed - once daily, at same time each day. Do not use more often than prescribed. Do not use as an acute "rescue" bronchodilator. Capsules are not to be swallowed. May cause nausea or vomiting (small frequent meals and frequent mouth care may help); dry mouth; hyperglycemia (if you have diabetes, monitor serum glucose closely); muscle or skeletal pain (consult prescriber for appropriate analgesic). Report swelling of face, mouth, or tongue; skin rash; chest pain or palpitations; persistent gastrointestinal effects; muscle or skeletal pain or weakness; change in vision; numbness or weakness of extremities; slurred speech; or respiratory changes, sore throat, or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intent to be pregnant. Breast-feeding is not recommended.

Administration of HandiHaler® Inhaler: Remove capsule from blister pack immediately before using. Place capsule in capsule-chamber in the base of inhaler. Close mouthpiece until a click is heard, leaving dustcap open. Exhale fully (do not exhale into inhaler). Place mouthpiece gently between teeth, closing lips around inhaled, tilt head back slightly, and inhale once rapidly, steadily and deeply (the capsule vibration may be heard within the inhaler, but you will not sense the medication as it is inhaled.) Hold breath as long as possible. Remove inhaler from mouth before exhaling. If any powder remains in capsule, repeat inhalation again. Throw away empty capsule. Do not store capsule in inhaler and always keep inhaler and capsules dry.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral inhalation [capsule]:

Spiriva® HandiHaler®: 18 mcg/capsule (5s, 30s, 90s) [contains lactose]

Generic AvailableNo

ManufacturerBoehringer Ingelheim

Pricing: U.S. (www.drugstore.com)

Capsules (Spiriva HandiHaler)

18 mcg (6): $41.99

18 mcg (30): $159.98

Mechanism of ActionBlocks the action of acetylcholine at parasympathetic sites in bronchial smooth muscle causing bronchodilation

Pharmacodynamics/Kinetics

Absorption: Poorly absorbed from GI tract, systemic absorption may occur from lung

Distribution: V$_d$: 32 L/kg

Protein binding: 72%

Metabolism: Hepatic (minimal), via CYP2D6 and CYP3A4

Bioavailability: Following inhalation, 19.5%; oral solution: 2% to 3%

Half-life elimination: 5-6 days

Time to peak, plasma: 5 minutes (following inhalation)

Excretion: Urine (14% of an inhaled dose); feces (primarily nonabsorbed drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and ulcerative stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health CommentMany psychotropic agents possess intrinsic anticholinergic properties or produce anticholinergic side effects. Concomitant use with tiotropium may produce additive anticholinergic effects.

Paclitaxel: I.V.: 175 mg/m^2 day 1

[total dose/cycle = 175 mg/m^2]

Ifosfamide: I.V.: 1000 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 3000 mg/m^2]

Mesna: I.V.: 400 mg/m^2/day before ifosfamide days 1, 2, and 3

plus I.V.: 200 mg/m^2 4 hours after ifosfamide days 1, 2, and 3

[total dose/cycle = 1800 mg/m^2]

Cisplatin: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 21-28 days

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tip RA na veer)

U.S. Brand NamesAptivus®

Canadian Brand NamesAptivus®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV-1 infections in combination with ritonavir and other antiretroviral agents; limited to highly treatment-experienced or multiprotease inhibitor-resistant patients.

Dosing: Adults**HIV infection:** Oral: 500 mg twice daily with a high-fat meal. **Note:** Coadministration with ritonavir (200 mg twice daily) is required.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**HIV infection:** Children ≥2 years: Oral: 14 mg/kg or 375 mg/m^2 (maximum: 500 mg/dose) twice daily. **Note:** Coadministration with ritonavir (6 mg/kg or 150 mg/m^2 [maximum 200 mg/dose] twice daily) is required.

If intolerance or toxicity develops and virus is not resistant to multiple protease inhibitors: May decrease dose to 12 mg/kg or 290 mg/m^2 twice daily. **Note:** Coadministration with ritonavir (5 mg/kg or 115 mg/m^2 twice daily) is required.

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic Impairment

Mild impairment (Child-Pugh class A): No adjustment required.

Moderate-to-severe impairment (Child-Pugh class B-C): Concurrent use is contraindicated.

Administration: Oral

Should be administered with a high-fat meal (bioavailability is increased); coadministration with ritonavir is required

Dietary ConsiderationsContains dehydrated ethanol 7% w/w (0.1 g per capsule). Oral solution formulation contains vitamin E; additional vitamin E supplements should be avoided.

Storage

Capsule: Prior to opening bottle, store under refrigeration at 2°C to 8°C (36°F to 46°F). After bottle is opened, may be stored at controlled room temperature of 25°C (77°F) for up to 60 days.

Oral solution: Store at 15°C to 30°C (59°F to 86°F). After bottle is open, use within 60 days. Do not refrigerator or freeze oral solution.

ContraindicationsConcurrent therapy of tipranavir/ritonavir with amiodarone, cisapride, ergot derivatives (eg, dihydroergotamine, ergonovine, ergotamine, methylergonovine), flecainide, lovastatin, midazolam, pimozide, propafenone, quinidine, rifampin, simvastatin, St John's wort, and triazolam; moderate-to-severe hepatic impairment (Child-Pugh class B and C)

Warnings/Precautions

Boxed warnings:

- Hepatotoxicity: See "Concerns related to adverse effects" below.
- Intracranial hemorrhage: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hepatotoxicity: **[U.S. Boxed Warning]: In combination with ritonavir, may cause hepatitis (including fatalities) and/or exacerbate pre-existing hepatic dysfunction (causal relationship not established); patients with chronic hepatitis B or C are at increased risk.** Monitor patients closely; discontinue use if signs or symptoms of toxicity occur or if asymptomatic AST/ALT elevations >10 times upper limit of normal or AST/ALT elevations >5-10 times upper limit of normal concurrently with total bilirubin >2.5 times the upper limit of normal occur.
- Hypersensitivity reactions: Protease inhibitors have been associated with a variety of hypersensitivity events (some severe), including rash, anaphylaxis (rare), angioedema, bronchospasm, erythema multiforme, and/or Stevens-Johnson syndrome (rare). It is generally recommended to discontinue treatment if severe rash or moderate symptoms accompanied by other systemic symptoms occur.
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Increased cholesterol: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.

- Intracranial hemorrhage: **[U.S. Boxed Warning]: Use in combination with ritonavir, has been associated with rare reports of fatal and nonfatal intracranial hemorrhage; causal relationship not established.** Events often occurred in patients with medical conditions (eg, CNS lesions, head trauma, recent neurosurgery, coagulopathy, alcohol abuse) or concurrent therapy which may have influenced these events.

- Sulfonamide allergy: Use with caution in patients with sulfonamide allergy.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.

- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.

- Hepatic impairment: Use with caution in patients with mild hepatic impairment; contraindicated in moderate-to-severe impairment.

- Platelet aggregation: May impair platelet aggregation, resulting in bleeding; use with caution in patients who may be at risk for increased bleeding (trauma, surgery or other medical conditions).

Concurrent drug therapy issues:

- Anticoagulants and antiplatelet agents: Coadministration may increase the risk of bleeding.

- Estrogens: Women receiving estrogen (as hormonal contraception or replacement therapy) have an increased incidence of rash. Alternative forms of contraception may be needed.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors and moderate CYP3A4 inducers. Concomitant use with selected major CYP3A4 substrates and strong CYP3A4 inducers is contraindicated (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Ritonavir: Coadministration with ritonavir is required.

Concurrent drug therapy issues:

- Vitamin E: Oral solution formulation contains vitamin E; additional vitamin E supplements should be avoided.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsIt is not known if tipranavir crosses the human placenta. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Women receiving estrogen (as hormonal contraception or replacement therapy) have an increased incidence of rash. Alternative forms of contraception may be needed. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.
Adverse Reactions
>10%:

Dermatologic: Rash (children 21%; adults 3% to 10%)

Endocrine & metabolic: Hypercholesterolemia (>300 mg/dL: 22%), hypertriglyceridemia (>400 mg/dL: 61%)

Gastrointestinal: Diarrhea (15%)

Hepatic: Transaminases increased (>2.5 x ULN: 26% to 32%; grade 3/4: 10% to 20%)

Neuromuscular & skeletal: CPK increased (grade 3/4: children 11%)

2% to 10%:

Central nervous system: Fever (6% to 8%), fatigue (6%), headache (5%)

Endocrine & metabolic: Dehydration (2%)

Gastrointestinal: Nausea (5% to 9%), amylase increased (grade 3: 6% to 8%), vomiting (6%), abdominal pain (4%), diarrhea (children 4%), weight loss (3%)

Hematologic: Bleeding (children 8%), WBC decreased (grades 3: 5%), anemia (3%), neutropenia (2%)

Hepatic: ALT increased (2%, grades 3/4: 10%), AST increased (grades 3/4: 6%), GGT increased (2%)

Neuromuscular & skeletal: Myalgia (2%)

Respiratory: Cough (children 6%), dyspnea (2%), epistaxis (children 4%)

<2%: Abdominal distension, anorexia, appetite decreased, diabetes mellitus, dizziness, dyspepsia, exanthem, facial wasting, flatulence, flu-like syndrome, gastroesophageal reflux, hepatic failure, hepatic steatosis, hepatitis, hyperbilirubinemia, hyperglycemia, hypersensitivity, immune reconstitution syndrome, insomnia, intracranial hemorrhage, lipase increased, lipoatrophy, lipodystrophy (acquired), lipohypertrophy, malaise, mitochondrial toxicity, muscle cramp, neuropathy (peripheral), pancreatitis, pruritus, renal insufficiency, sleep

disorder, somnolence, thrombocytopenia

Metabolism/Transport Effects **Substrate** of CYP3A4 (major; minimal metabolism when coadministered with ritonavir)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Didanosine: Tipranavir may decrease the serum concentration of Didanosine. *Risk C: Monitor therapy*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of Tipranavir. *Risk D: Consider therapy modification*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Estrogen Derivatives: May enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

Etravirine: Tipranavir may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Flecainide: Tipranavir may increase the serum concentration of Flecainide. *Risk X: Avoid combination*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease

Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

MetroNIDAZOLE: May enhance the adverse/toxic effect of Tipranavir. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

PHENobarbital: May decrease the serum concentration of Tipranavir. Tipranavir may decrease the serum concentration of PHENobarbital. *Risk D: Consider therapy modification*

Phenytoin: May decrease the serum concentration of Tipranavir. Tipranavir may decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Propafenone: Tipranavir may increase the serum concentration of Propafenone. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: Tipranavir may decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Raltegravir: Tipranavir may decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

St Johns Wort: May decrease the serum concentration of Tipranavir. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Capsules contain dehydrated alcohol 7% w/w (0.1g per capsule)

Food: Bioavailability is increased with a high-fat meal.

Herb/Nutraceutical: St Johns wort may decrease the levels/effects of tipranavir/ritonavir; concurrent use is contraindicated. Vitamin E (high dose) may increase the risk of bleeding.

Monitoring ParametersViral load, CD4, serum glucose, liver function tests, bilirubin

Nursing: Physical Assessment/MonitoringUse caution in presence of impaired hepatic function, sulfonamide allergy, and risk for bleeding. Assess other pharmacologic or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used concurrently is available in each bottle and patients should be provided with this information. Assess therapeutic response (eg, CD4 count, hepatic function) and adverse reactions at regular intervals during therapy (eg, gastrointestinal disturbance [nausea, vomiting, diarrhea] that can lead to dehydration and weight loss, hyperlipidemia, redistribution of body fat, rash, electrolyte imbalance). Caution patients to monitor glucose levels closely; may alter effects of hypoglycemic agents or cause hyperglycemia. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsViral load, CD4, serum glucose, liver function tests, bilirubin

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescriptions, over-the-counter medications, or herbal products during therapy (even if they are not on the list) without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Take exactly as directed with a high-fat meal. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you miss a dose, take as soon as possible and return to your regular schedule (never take a double dose). Frequent blood tests may be required with prolonged therapy. You may be advised to check your glucose levels; this drug can cause exacerbation or new-onset diabetes. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug). May cause dizziness, insomnia, abnormal thinking (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea, vomiting, or taste perversion (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); muscle weakness (consult prescriber for approved analgesic); or headache or insomnia (consult prescriber for medication). Inform prescriber if you experience muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; unusual skin rash; change in color of stool or urine; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, soft gelatin:

Aptivus®: 250 mg [contains dehydrated ethanol 7% per capsule]

Solution:

Aptivus®: 100 mg/mL (95 mL) [contains vitamin E, propylene glycol; buttermint-butter toffee flavor]

Generic AvailableNo

Manufacturer

Boehringer Ingelheim

Pricing: U.S. (www.drugstore.com)

Capsules (Aptivus)

250 mg (120): $1019.87

Mechanism of ActionTipranavir is a nonpeptide inhibitor of HIV-1 protease. It binds to the protease activity site and inhibits the activity of the enzyme. HIV protease is required for the cleavage of viral polyprotein precursors into individual functional proteins found in infectious HIV. Inhibition prevents cleavage of these polyproteins, resulting in the formation of immature, noninfectious viral particles.

Pharmacodynamics/Kinetics

Absorption: Incomplete (percentage not established)

Distribution: V_d: 7.7-10 L

Protein binding: >99% (albumin, alpha_1-acid glycoprotein)

Metabolism: Hepatic, via CYP3A4 (minimal when coadministered with ritonavir)

Bioavailability: Not established; increased with high-fat meal

Half-life elimination: Children 2-<6 years of age: ~8 hours, 6-<12 years of age: ~7 hours, 12-18 years: ~5 hours; Adults: 6 hours

Time to peak, plasma: 3 hours

Excretion: Feces (82%); urine (4%); primarily as unchanged drug (when coadministered with ritonavir)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Perinatal HIV Guidelines

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue and depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with midazolam, pimozide, and triazolam. May cause hyperlipidemia and hyperglycemia; concurrent use with atypical antipsychotics, valproic acid, and carbamazepine may produce additive effects; monitor. Use caution with disulfiram (capsules contain dehydrated ethanol). Carbamazepine may decrease serum concentration of tipranavir. The effect of methadone may be reduced by tipranavir requiring a dosage adjustment.

Medication Safety Issues

Sound-alike/look-alike issues:

Aggrastat® may be confused with Aggrenox®, argatroban

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(tye roe FYE ban)
U.S. Brand NamesAggrastat®
Canadian Brand NamesAggrastat®
Pharmacologic CategoryAntiplatelet Agent, Glycoprotein IIb/IIIa Inhibitor
Use: Labeled IndicationsIn combination with heparin, is indicated for the treatment of acute coronary syndrome, including patients who are to be managed medically and those undergoing PTCA or atherectomy. In this setting, it has been shown to decrease the rate of a combined endpoint of death, new myocardial infarction or refractory ischemia/repeat cardiac procedure.
Dosing: Adults**Acute coronary syndromes:** I.V.: Initial rate of 0.4 mcg/kg/minute for 30 minutes and then continued at 0.1 mcg/kg/minute. Dosing should be continued through angiography and for 12-24 hours after angioplasty or atherectomy.
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Reduce dose to 50% of normal rate.
Calculations

- Creatinine Clearance: Adults

Administration: I.V.Infuse over 30 minutes. Tirofiban injection must be diluted to a concentration of 50 mcg/mL (premixed solution does not require dilution). Unused solution should be discarded. Do not administer via the same IV line as diazepam.
Administration: I.V. DetailIntended for intravenous delivery using sterile equipment and technique. Do not add other drugs or remove solution directly from the bag with a syringe. Do not use plastic containers in series connections. Such use can result in air embolism by drawing air from the first container if it is empty of solution. Discard any unused solution. May be administered through the same catheter as heparin, lidocaine, dopamine, potassium chloride, and famotidine.
StorageStore at 25°C (77°F); do not freeze. Protect from light during storage.
CompatibilityStable in $D_5{}^1/_2$NS, D_5W, NS.

Y-site administration: Compatible: Atropine, dobutamine, dopamine, epinephrine, famotidine, heparin, lidocaine, midazolam, morphine, nitroglycerin, potassium chloride, propranolol. **Incompatible:** Diazepam.

ContraindicationsHypersensitivity to tirofiban or any component of the formulation; active internal bleeding or a history of bleeding diathesis within the previous 30 days; history of intracranial hemorrhage, intracranial neoplasm, arteriovenous malformation, or aneurysm; history of thrombocytopenia following prior exposure; history of CVA within 30 days or any history of hemorrhagic stroke; major surgical procedure or severe physical trauma within the previous month; history, symptoms, or findings suggestive of aortic dissection; severe hypertension (systolic BP >180 mm Hg and/or diastolic BP >110 mm Hg); concomitant use of another parenteral GP IIb/IIIa inhibitor; acute pericarditis
Allergy Considerations

- Glycoprotein (GP) IIb/IIIa Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: The most common complication is bleeding, including retroperitoneal, pulmonary, and spontaneous GI and/or GU bleeding; watch closely for bleeding, especially the arterial access site for the cardiac catheterization. Use with extreme caution in patients with platelet counts <150,000/mm^3, patients with hemorrhagic retinopathy, previous history of GI disease, recent thrombolytic therapy and in chronic dialysis patients. Use caution with administration of other drugs affecting hemostasis. Minimize other procedures including arterial and venous punctures, I.M. injections, nasogastric tubes, etc.

Disease-related concerns:

- Renal impairment: Adjust the dose with severe renal dysfunction (Cl_{cr} <30 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Sheath removal: Prior to pulling the sheath, heparin should be discontinued for 3-4 hours and ACT <180 seconds or aPTT <45 seconds. Use standard compression techniques after sheath removal. Watch the site closely afterwards for further bleeding.

Geriatric ConsiderationsElderly patients receiving tirofiban with heparin or heparin alone had a higher incidence of bleeding in clinical trials. Caution must be used when using other drugs affecting hemostasis, which are commonly used in elderly.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsBleeding is the major drug-related adverse effect. Patients received background treatment with aspirin and heparin. Major bleeding was reported in 1.4% to 2.2%; minor bleeding in 10.5% to 12%; transfusion was required in 4% to 4.3%.

>1% (nonbleeding adverse events):

Cardiovascular: Bradycardia (4%), coronary artery dissection (5%), edema (2%)

Central nervous system: Dizziness (3%), fever (>1%), headache (>1%), vasovagal reaction (2%)

Gastrointestinal: Nausea (>1%)

Genitourinary: Pelvic pain (6%)

Hematologic: Thrombocytopenia: <90,000/mm^3 (1.5%), <50,000/mm^3 (0.3%)

Neuromuscular & skeletal: Leg pain (3%)

Miscellaneous: Diaphoresis (2%)

<1% (Limited to important or life-threatening): Intracranial bleeding (up to 0.1%), GI bleeding (0.1% to 0.2%), retroperitoneal bleeding (up to 0.6%), GU bleeding (up to 0.1%), hemopericardium, hives, pulmonary alveolar hemorrhage, rash, anaphylaxis (case reports), severe (<10,000/mm^3) thrombocytopenia (rare), spinal-epidural hematoma, urticaria

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Monitoring ParametersPlatelet count. Hemoglobin and hematocrit should be monitored prior to treatment, within 6 hours following loading infusion, and at least daily thereafter during therapy. Platelet count may need to be monitored earlier in patients who received prior glycoprotein IIb/IIa antagonists. Persistent reductions of platelet counts <90,000/mm^3 may require interruption or discontinuation of infusion. Because tirofiban requires concurrent heparin therapy, aPTT levels should also be followed. Monitor vital signs and laboratory results prior to, during, and after therapy. Assess infusion insertion site during and after therapy (every 15 minutes or as institutional policy). Observe and teach patient bleeding precautions (avoid invasive procedures and activities that could result in injury). Monitor closely for signs of unusual or excessive bleeding (eg, CNS changes, blood in urine, stool, or vomitus, unusual bruising or bleeding). Breast-feeding is contraindicated.

Nursing: Physical Assessment/MonitoringMonitor vital signs and laboratory results prior to, during, and after therapy. Assess infusion insertion site during and after therapy. Monitor closely for bleeding and teach bleeding precautions.

Monitoring: Lab TestsPlatelet count, persistent reductions <90,000/mm^3 may require interruption or discontinuation of infusion. Hemoglobin and hematocrit should be monitored prior to treatment, within 6 hours following loading infusion, and at least daily thereafter during therapy. Platelet count may need to be monitored earlier in patients who received prior glycoprotein IIb/IIa antagonists. Because tirofiban requires concurrent heparin therapy, aPTT levels should also be followed.

Patient EducationEmergency use may dictate depth of patient education. This medication can only be administered I.V. You will have a tendency to bleed easily following this medication. Use caution to prevent injury (use electric razor, use soft toothbrush, use caution with sharps). If bleeding occurs, apply pressure to bleeding spot until bleeding stops completely. Report unusual bruising or bleeding (eg, blood in urine, stool, or vomitus, bleeding gums, vaginal bleeding, nosebleeds); unusual and persistent fever; dizziness or vision changes; back, leg, or pelvic pain; or persistent nausea or vomiting. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontuned product

Infusion [premixed in sodium chloride]:

Aggrastat®: 50 mcg/mL (100 mL, 250 mL)

Injection, solution:

Aggrastat®: 250 mcg/mL (50 mL) [DSC]

Generic AvailableNo

Mechanism of ActionA reversible antagonist of fibrinogen binding to the GP IIb/IIIa receptor, the major platelet surface receptor involved in platelet aggregation. When administered intravenously, it inhibits *ex vivo* platelet aggregation in a dose- and concentration-dependent manner. When given according to the recommended regimen, >90% inhibition is attained by the end of the 30-minute infusion. Platelet aggregation inhibition is reversible following cessation of the infusion.

Pharmacodynamics/Kinetics

Distribution: 35% unbound

Metabolism: Minimally hepatic

Half-life elimination: 2 hours

Excretion: Urine (65%) and feces (25%) primarily as unchanged drug

Clearance: Elderly: Reduced by 19% to 26%

Related Information

- Glycoprotein Antagonists

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with a recent stroke (within 30 days)

Cardiovascular Considerations

Acute Coronary Syndromes (ACS): The 2004 ACC/AHA STEMI and the 2002 ACC/AHA unstable angina/non-ST-segment elevation myocardial infarction (UA/NSTEMI) guidelines recommend administration of intravenous glycoprotein IIb/IIIa inhibitors in patients with non-ST-segment elevation ACS with high-risk features (eg, positive biochemical markers of infarction, ST-segment depression, or signs of LV dysfunction) or refractory ischemia. Eptifibatide or tirofiban (with ASA and LMWH or UFH) should be chosen in patients who have high-risk features where an invasive management strategy is not planned. In addition, a glycoprotein IIb/IIIa inhibitor is recommended for patients who will undergo percutaneous coronary intervention (PCI).

Adjunct to Thrombolysis: In the TARGET trial, abciximab (FDA-approved dose) and tirofiban (10 mcg/kg bolus; infusion of 0.15 mcg/kg/minute for 18-24 hours) were compared to each other in patients undergoing coronary stenting. The primary endpoint was death, nonfatal MI, or urgent target vessel revascularization at 30 days. Abciximab improved outcome to a greater extent than tirofiban, primarily by reducing nonfatal MI. Follow-up at one year revealed no significant difference in primary outcomes between treatments.

Platelet Effects: Tirofiban has a short duration of action and hemostasis is restored within ~4 hours after discontinuation in patients with normal renal function.

Anesthesia and Critical Care Concerns/Other Considerations**Platelet Effects:** Tirofiban has a short duration of action and hemostasis is restored within about 4 hours after discontinuation in patients with normal renal function.

Index TermsMK383; Tirofiban Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

TiZANidine may be confused with tiaGABine

Zanaflex® capsules and Zanaflex® tablets (or generic tizanidine tablets) are not interchangeable

Pronunciation(tye ZAN i deen)

U.S. Brand NamesZanaflex Capsules™; Zanaflex®

Canadian Brand NamesApo-Tizanidine®; Gen-Tizanidine; Zanaflex®

Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist

Use: Labeled IndicationsSkeletal muscle relaxant used for treatment of muscle spasticity

Use: Unlabeled/InvestigationalTension headaches, low back pain, and trigeminal neuralgia

Dosing: Adults**Spasticity:** Usual initial dose: 4 mg, may increase by 2-4 mg as needed for satisfactory reduction of muscle tone every 6-8 hours to a maximum of 3 doses in any 24 hour period

Range: 2-4 mg 3 times/day

Maximum: 36 mg/day

Dosing: ElderlyNo specific dosing guidelines exist; clearance is decreased; dose cautiously.

Dosing: Renal ImpairmentCl_{cr} <25 mL/minute: Use with caution; clearance reduced >50%. During initial dose titration, use reduced doses. If higher doses necessary, increase dose instead of increasing dosing frequency.

Dosing: Hepatic ImpairmentAvoid use in hepatic impairment; if used, lowest possible dose should be used initially with close monitoring for adverse effects (eg, hypotension).

Administration: OralCapsules may be opened and contents sprinkled on food; however, extent of absorption is increased up to 20% relative to administration of the capsule under fasted conditions.

Dietary ConsiderationsAdministration with food compared to administration in the fasting state results in clinically-significant differences in absorption and other pharmacokinetic parameters. Patients should be consistent and should not switch administration of the tablets or the capsules between the fasting and nonfasting state. In addition, switching between the capsules and the tablets in the fed state will also result in significant differences. Opening capsule contents to sprinkle on applesauce compared to swallowing intact capsules whole will also result in significant absorption differences. Patients should be consistent with regards to administration.

ContraindicationsHypersensitivity to tizanidine or any component of the formulation; concomitant therapy with ciprofloxacin or fluvoxamine (potent CYP1A2 inhibitors)

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic effects: Potential for hepatotoxicity; AST/ALT elevations (≥2 times baseline) and rarely hepatic failure have occurred; monitor aminotransferases prior to and during use.
- Hypotension: Dose-related significant hypotension (possibly with bradycardia or orthostatic hypotension) may occur; use with caution in patients with cardiac disease or those at risk for severe hypotensive effects.
- Sedation: Dose-related sedation common with use; significant and severe sedation may also occur; use with caution in patients at risk for sedative effects.
- Visual hallucinations: Use has been associated with visual hallucinations or delusions, generally in first 6 weeks of therapy; use caution in patients with psychiatric disorders.

Disease-related concerns:

- Hepatic impairment: Avoid or use extreme caution in patients with hepatic impairment; potential for effects likely due to extensive hepatic metabolism of tizanidine.
- Renal impairment: Use with caution in patients with renal impairment; clearance decreased significantly in severe impairment (Cl_{cr} <25 mL/minute) and dose reductions recommended.

Concurrent drug therapy issues:

- Antihypertensives: Hypotensive effects may be potentiated when used with antihypertensives.
- CNS depressants: Sedative effects may be potentiated when used with other CNS depressants.
- High potential for interactions: In general, avoid use in patients taking other CYP1A2 inhibitors; if taken concomitantly, use with caution and monitor for increased hypotensive and sedative effects of tizanidine.

Special populations:

- Elderly: Use with caution; clearance decreased fourfold in the elderly; may increase risk of adverse effects and/or duration of effects. Elderly with severe renal impairment (Cl_{cr} <25 mL/minute) may have clearance reduced by >50% compared to healthy elderly subjects.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Withdrawal resulting in rebound hypertension, tachycardia, and hypertonia may occur upon discontinuation; doses should be decreased slowly, particularly in patients receiving high doses for prolonged periods.

- Food: Food alters absorption profile relative to administration under fasting conditions. In addition, bioequivalence between capsules and tablets altered by food; capsules and tablets bioequivalent under fasting conditions, but not under nonfasting conditions.

- Long-term use: Limited data exists for chronic use of single doses >8 mg and multiple doses >24 mg/day.

Geriatric ConsiderationsSince elderly commonly have renal function of Cl_{cr}<30 mL/minute, creatinine clearance should be estimated before dosing this medication. Low doses should be started initially because of the possibility of CNS effects.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency percentages below reported during multiple-dose studies, unless specified otherwise.

>10%:

Cardiovascular: Hypotension (single-dose study with doses ≥8 mg: 16% to 33%)

Central nervous system: Somnolence (48%), dizziness (16%)

Gastrointestinal: Xerostomia (49%)

Neuromuscular & skeletal: Weakness (41%)

1% to 10%:

Cardiovascular: Bradycardia (single-dose study with doses ≥8 mg: 2% to 10%)

Central nervous system: Nervousness (3%), speech disorder (3%), visual hallucinations/delusions (3%; generally occurring in first 6 weeks of therapy), anxiety (1%), depression (1%), fever (1%)

Dermatologic: Rash (1%), skin ulcer (1%)

Gastrointestinal: Constipation (4%), vomiting (3%), abdominal pain (1%), diarrhea (1%), dyspepsia (1%)

Genitourinary: UTI (10%), urinary frequency (3%)

Hepatic: Liver enzymes increased (3% to 5%)

Neuromuscular & skeletal: Dyskinesia (3%), back pain (1%), myasthenia (1%), paresthesia (1%)

Ocular: Blurred vision (3%)

Respiratory: Pharyngitis (3%), rhinitis (3%)

Miscellaneous: Infection (6%), flu-like syndrome (3%), diaphoresis (1%)

<1%, frequency not defined, and postmarketing experience (limited to important or life-threatening): Adrenal insufficiency, allergic reaction, anemia, angina, arrhythmia, asthma, carcinoma, cellulitis, cholelithiasis, coronary artery disorder, deafness, dementia, dyslipidemias, fecal impaction, gastrointestinal hemorrhage, glaucoma, heart failure, hepatomegaly, hemiplegia, hepatic failure, hepatitis, hepatoma, hyperglycemia, hypokalemia, hyponatremia, hypoproteinemia, hypothyroidism, jaundice, leukopenia, leukocytosis, MI, optic neuritis, palpitation, personality disorder (various), pneumonia, postural hypotension, psychotic-like symptoms, pulmonary embolus, respiratory acidosis, retinal hemorrhage, sepsis, suicide attempt, syncope, thrombocythemia, thrombocytopenia, ventricular extrasystoles, ventricular tachycardia

Metabolism/Transport Effects**Substrate** of CYP1A2 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antidepressants (Alpha2-Antagonist): May diminish the hypotensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Ciprofloxacin: May decrease the metabolism of TiZANidine. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of TiZANidine. *Risk X: Avoid combination*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Alpha2-Agonists may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Oral Contraceptive (Estrogens): May increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: The tablet and capsule dosage forms are not bioequivalent when administered with food. Food increases both the time to peak concentration and the extent of absorption for both the tablet and capsule. However, maximal concentrations of tizanidine achieved when administered with food were increased by 30% for the tablet, but decreased by 20% for the capsule. Under fed conditions, the capsule is approximately 80% bioavailable relative to the tablet.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may increase hypotensive effects).

Monitoring ParametersMonitor liver function (aminotransferases) at baseline, 1, 3, 6 months and periodically thereafter; blood pressure; renal function

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. May cause hypotension; monitor blood pressure periodically. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions on a regular basis throughout therapy. Do not discontinue medication abruptly; can cause hypertension and tachycardia. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor liver function (aminotransferases) at baseline, 1, 3, 6 months and periodically thereafter; renal function

Patient EducationDo not take any new medications without approval from prescriber. Take exactly as directed; do not change dosage or discontinue without consulting prescriber. If you miss a dose, take the missed dose as soon as possible if it is within an hour or so of the regular time. If not within an hour or so, skip the missed dose and go back to your regular dosing schedule. Do not double doses. Avoid alcohol. May cause dizziness, nervousness, insomnia, or daytime drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution and avoid quick moves when rising from sitting or lying position, climbing stairs, or engaging in activities that require quick movements); or nausea, vomiting, dry mouth, mouth sores, or upset stomach (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report persistent dizziness or GI symptoms; chest pain or palpitations; CNS disturbances (delusions, confusion); muscle weakness or tremors; rash; respiratory difficulty; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Zanaflex Capsules™: 2 mg, 4 mg, 6 mg

Tablet: 2 mg, 4 mg

Zanaflex®: 2 mg [DSC], 4 mg [scored]

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Zanaflex)

2 mg (150): $266.18

4 mg (150): $360.62

6 mg (150): $500.58

Tablets (Tizanidine HCl)

2 mg (90): $19.99

4 mg (90): $81.99

Tablets (Zanaflex)

4 mg (90): $173.98

Mechanism of ActionAn alpha$_2$-adrenergic agonist agent which decreases excitatory input to alpha motor neurons; an imidazole derivative chemically-related to clonidine, which acts as a centrally acting muscle relaxant with alpha$_2$-adrenergic agonist properties; acts on the level of the spinal cord

Pharmacodynamics/Kinetics

Duration: 3-6 hours

Absorption: Tablets and capsules are bioequivalent under fasting conditions, but not under nonfasting conditions.

Tablets administered with food: Peak plasma concentration is increased by ~30%; time to peak increased by 25 minutes; extent of absorption increased by ~30%.

Capsules administered with food: Peak plasma concentration decreased by 20%; time to peak increased by 2-3 hours; extent of absorption increased by ~10%.

Capsules opened and sprinkled on applesauce are not bioequivalent to administration of intact capsules under fasting conditions. Peak plasma concentration and AUC are increased by 15% to 20%.

Protein binding: ~30%

Metabolism: Extensively hepatic

Bioavailability: ~40% (extensive first-pass metabolism)

Half-life elimination: 2.5 hours

Time to peak, serum:

Fasting state: Capsule, tablet: 1 hour

Fed state: Capsule: 3-4 hours, Tablet: 1.5 hours

Excretion: Urine (60%); feces (20%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause dizziness, anxiety, nervousness, or insomnia; may rarely cause psychosis

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation and dry mouth

Index TermsSirdalud®

Pronunciation(toe bra MYE sin & deks a METH a sone)

U.S. Brand NamesTobraDex®

Canadian Brand NamesTobradex®

Pharmacologic CategoryAntibiotic/Corticosteroid, Ophthalmic

Use: Labeled IndicationsTreatment of external ocular infection caused by susceptible gram-negative bacteria and steroid responsive inflammatory conditions of the palpebral and bulbar conjunctiva, lid, cornea, and anterior segment of the globe

Dosing: Adults**Ocular infection/inflammation:** Ophthalmic: Instill 1-2 drops of solution every 4 hours; apply ointment 2-3 times/day; for severe infections apply ointment every 3-4 hours, or solution 2 drops every 30-60 minutes initially, then reduce to less frequent intervals

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Ocular infection/inflammation:** Children: Refer to adult dosing.

Administration: OtherContact lenses should not be worn during therapy.

Ointment: Do not touch tip of tube to eye. Instill ointment into pocket between eyeball and lower lid; patient should look downward before closing eye.

Suspension: Shake well before using; Tilt head back, instill suspension in conjunctival sac and close eye(s). Do not touch dropper to eye. Apply light finger pressure on lacrimal sac for 1 minute following instillation.

ContraindicationsHypersensitivity to tobramycin, dexamethasone, or any component of the formulation; viral, fungal, or tuberculosis diseases of the eye

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use of corticosteroids may result in glaucoma; damage to the optic nerve, defects in visual acuity and fields of vision, and posterior subcapsular cataract formation may occur.
- Sensitivity reactions: Sensitivity to tobramycin may develop; discontinue if sensitivity reaction occurs.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection.

Special populations:

- Cataract surgery patients: Use following cataract surgery may delay healing or increase the incidence of bleb formation.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

- Benzalkonium chloride: Suspension contains benzalkonium chloride which may be adsorbed by contact lenses; contact lenses should not be worn during treatment of ophthalmic infections.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only. A maximum of 8 g of ointment or 20 mL of suspension should be prescribed initially; patients should be evaluated prior to additional refills.

Geriatric ConsiderationsAssess patient's ability to correctly self-administer eye drops.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSee individual agents.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is unknown if topical use results in sufficient absorption to produce detectable quantities in breast milk.

Adverse ReactionsUnless otherwise noted, frequency not defined.

Dermatologic: Allergic contact dermatitis, delayed wound healing

Ocular: Cataract formation, conjunctival erythema (<4%), glaucoma, intraocular pressure increased, keratitis, lacrimation, lid itching (<4%), lid swelling (<4%), optic nerve damage, secondary infection

Metabolism/Transport Effects

Dexamethasone: **Substrate** of CYP3A4 (minor); **Induces** CYP2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Lenalidomide: Dexamethasone may enhance the thrombogenic effect of Lenalidomide. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Thalidomide: Dexamethasone may enhance the dermatologic adverse effect of Thalidomide. Dexamethasone may enhance the thrombogenic effect of Thalidomide. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure and secondary infection with prolonged use
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient Education

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, ophthalmic: Tobramycin 0.3% and dexamethasone 0.1% (3.5 g)

Suspension, ophthalmic: Tobramycin 0.3% and dexamethasone 0.1% (2.5 mL, 5 mL, 10 mL) [contains benzalkonium chloride]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Ointment (TobraDex)

0.3-0.1% (3.5): $94.17

Suspension (TobraDex)

0.3-0.1% (2.5): $49.38

0.3-0.1% (5): $82.83

0.3-0.1% (10): $152.58

Mechanism of ActionRefer to individual monographs for Dexamethasone and Tobramycin
Pharmacodynamics/Kinetics

Absorption: Into aqueous humor

Time to peak, serum: 1-2 hours in the cornea and aqueous humor

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsDexamethasone and Tobramycin
International Brand NamesBralifex Plus (ID); Duocom (PH); Mydexin (PH); Mytodex (PH); Ramtrex (PH); Tobesyn Eye Drop (KP); Tobracort (CO, MX, PE); Tobradex (AE, AR, BE, BF, BG, BH, BJ, BR, CH, CI, CL, CN, CR, CY, DK, EE, EG, ES, ET, FR, GB, GH, GM, GN, GR, GT, HK, HN, IL, IN, IQ, IR, IT, JO, KE, KP, KW, LB, LR, LY, MA, ML, MR, MU, MW, MY, NE, NG, NI, OM, PA, PH, PK, PY, QA, SA, SC, SD, SL, SN, SV, SY, TN, TW, TZ, UG, UY, VE, YE, ZA, ZM, ZW); Tobragan D (CO, EC); Tobrasone (NO, SE)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Tobramycin may be confused with Trobicin®, vancomycin

AKTob® may be confused with AK-Trol®

Nebcin® may be confused with Inapsine®, Naprosyn®, Nubain®

Tobrex® may be confused with TobraDex®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (intrathecal administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(toe bra MYE sin)

U.S. Brand NamesAKTob®; TOBI®; Tobrex®

Canadian Brand NamesPMS-Tobramycin; Sandoz-Tobramycin; TOBI®; Tobramycin Injection, USP; Tobrex®

Pharmacologic Category[Antibiotic, Aminoglycoside](); [Antibiotic, Ophthalmic]()

Use: Labeled IndicationsTreatment of documented or suspected infections caused by susceptible gram-negative bacilli including *Pseudomonas aeruginosa*; topically used to treat superficial ophthalmic infections caused by susceptible bacteria. Tobramycin solution for inhalation is indicated for the management of cystic fibrosis patients (>6 years of age) with *Pseudomonas aeruginosa*.

Dosing: Adults**Note:** Individualization is **critical** because of the low therapeutic index.

Use of ideal body weight (IBW) for determining the mg/kg/dose appears to be more accurate than dosing on the basis of total body weight (TBW). In morbid obesity, dosage requirement may best be estimated using a dosing weight of IBW + 0.4 (TBW - IBW).

Initial and periodic plasma drug levels (eg, peak and trough with conventional dosing) should be determined, particularly in critically-ill patients with serious infections or in disease states known to significantly alter aminoglycoside pharmacokinetics (eg, cystic fibrosis, burns, or major surgery).

Severe life-threatening infections: I.M., I.V.:

Conventional: 1-2.5 mg/kg/dose every 8-12 hours; to ensure adequate peak concentrations early in therapy, higher initial dosage may be considered in selected patients when extracellular water is increased (edema, septic shock, postsurgical, and/or trauma)

Once-daily: 4-7 mg/kg/dose once daily; some clinicians recommend this approach for all patients with normal renal function; this dose is at least as efficacious with similar, if not less, toxicity than conventional dosing.

Brucellosis: I.M., I.V.: 240 mg (I.M.) daily or 5 mg/kg (I.V.) daily for 7 days; either regimen recommended in combination with doxycycline

Cholangitis: I.M., I.V.: 4-6 mg/kg once daily with ampicillin

Cystic fibrosis: Inhalation:

Aerosolized tobramycin injection (unlabeled use): 80 mg 2 times/day; **Note:** Injectable formulation may contain preservatives, which may increase risk of bronchospasm.

TOBI®: 300 mg every 12 hours (do not administer doses <6 hours apart); administer in repeated cycles of 28 days on drug followed by 28 days off drug.

Diverticulitis, complicated: I.M., I.V.: 1.5-2 mg/kg every 8 hours (with ampicillin and metronidazole)

Infective endocarditis or synergy (for gram-positive infections): I.M., I.V.: 1 mg/kg every 8 hours (with ampicillin)

Meningitis*(Enterococcus or Pseudomonas aeruginosa)*: I.V.: 5 mg/kg/day in divided doses every 8 hours (administered with another bacteriocidal drug)

Ocular infections: Ophthalmic:

Ointment: Apply 2-3 times/day; for severe infections, apply every 3-4 hours

Solution: Instill 1-2 drops every 4 hours; for severe infections, instill 2 drops every 30-60 minutes initially, then reduce to less frequent intervals

Pelvic inflammatory disease: I.M., I.V.: Loading dose: 2 mg/kg, then 1.5 mg/kg every 8 hours **or** 4.5 mg/kg once daily

Plague*(Yersinia pestis)*: I.M., I.V.: Treatment: 5 mg/kg/day, followed by postexposure prophylaxis with doxycycline

Pneumonia, hospital- or ventilator-associated: I.M., I.V.: 7 mg/kg/day (with antipseudomonal beta-lactam or carbapenem)

Prophylaxis against endocarditis (dental, oral, upper respiratory procedures, GI/GU procedures): I.M., I.V.: 1.5 mg/kg with ampicillin (50 mg/kg) 30 minutes prior to procedure. **Note:** AHA guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis no longer recommended by the AHA.

Tularemia: I.M., I.V.: 5 mg/kg/day divided every 8 hours for 1-2 weeks

Urinary tract infection: I.M., I.V.: 1.5 mg/kg/dose every 8 hours

Dosing: ElderlyDosage should be based on an estimate of ideal body weight.

I.M., I.V.: 1.5-5 mg/kg/day in 1-2 divided doses

I.V.: Once daily or extended interval: 5-7 mg/kg/dose given every 24, 36, or 48 hours based on Cl_{cr} (see Renal Impairment and Geriatric Considerations).

Dosing: PediatricIndividualization is **critical** because of the low therapeutic index

Use of ideal body weight (IBW) for determining the mg/kg/dose appears to be more accurate than dosing on the basis of total body weight (TBW). In morbid obesity, dosage requirement may best be estimated using a dosing weight of IBW + 0.4 (TBW - IBW).

Usual dosage range: I.M., I.V.:

Infants and Children <5 years: 2.5 mg/kg/dose every 8 hours

Children >5 years: 2-2.5 mg/kg/dose every 8 hours

Ocular infection: Ophthalmic: Children ≥2 months: Refer to adult dosing.

Cystic fibrosis:

I.M., I.V.: 2.5-3.3 mg/kg every 6-8 hours. **Note:** Some patients may require larger or more frequent doses if serum levels document the need (eg, cystic fibrosis or febrile granulocytopenic patients).

Inhalation:

Aerosolized tobramycin injection (unlabeled use): 80 mg 2 times/day. **Note:** Injectable formulation may contain preservatives, which may increase risk of bronchospasm.

TOBI®: Children ≥6 years: Refer to adult dosing.

Meningitis: Neonates: I.M., I.V.:

0-7 days: <2000 g: 2.5 mg/kg every 18-24 hours; >2000 g: 2.5 mg/kg every 12 hours

8-28 days: <2000 g: 2.5 mg/kg every 8-12 hours; >2000 g: 2.5 mg/kg every 8 hours

Dosing: Renal ImpairmentI.M., I.V.:

Conventional dosing:

Cl_{cr} ≥60 mL/minute: Administer every 8 hours.

Cl_{cr} 40-60 mL/minute: Administer every 12 hours.

Cl_{cr} 20-40 mL/minute: Administer every 24 hours.

Cl_{cr} 10-20 mL/minute: Administer every 48 hours.

Cl_{cr} <10 mL/minute: Administer every 72 hours.

High-dose therapy: Interval may be extended (eg, every 48 hours) in patients with moderate renal impairment (Cl_{cr} 30-59 mL/minute) and/or adjusted based on serum level determinations.

Dialyzable; 30% removal of aminoglycosides occurs during 4 hours of HD - administer dose after dialysis and follow levels.

Continuous arteriovenous or venovenous hemofiltration: Dose as for Cl_{cr} of 10-40 mL/minute and follow levels.

Administration via CAPD fluid:

Gram-negative infection: 4-8 mg/L (4-8 mcg/mL) of CAPD fluid

Gram-positive infection (ie, synergy): 3-4 mg/L (3-4 mcg/mL) of CAPD fluid

Administration IVPB/I.M.: Dose as for Cl_{cr} <10 mL/minute and follow levels.

Dosing: Hepatic ImpairmentMonitor plasma concentrations.

Calculations

- Adjusted Body Weight
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V.Infuse over 30-60 minutes.

Some penicillins (eg, carbenicillin, ticarcillin and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailFlush with saline before and after administration. **Incompatible** with heparin.

pH: 3.0-6.5 (injection, adjusted); 6-8 (reconstituted solution from powder)

Administration: InhalationTOBI®: To be inhaled over ~15 minutes using a handheld nebulizer (PARI-LC PLUS™). If multiple different nebulizer treatments are required, administer bronchodilator first, followed by chest physiotherapy, any other nebulized medications, and then TOBI® last. Do not mix with other nebulizer medications.

Administration: TopicalOphthalmic solution: Allow 5 minutes between application of "multiple-drop" therapy.

Administration: OtherOphthalmic: Contact lenses should not be worn during treatment of ophthalmic infections.

Ointment: Do not touch tip of tube to eye. Instill ointment into pocket between eyeball and lower lid; patient should look downward before closing eye.

Solution: Contact lenses should not be worn during treatment of ophthalmic infections. Allow 5 minutes between application of "multiple-drop" therapy.

Suspension: Shake well before using; tilt head back, instill suspension in conjunctival sac and close eye(s). Do not touch dropper to eye. Apply light finger pressure on lacrimal sac for 1 minute following instillation.

Dietary ConsiderationsMay require supplementation of calcium, magnesium, potassium.

Storage

Injection: Stable at room temperature both as the clear, colorless solution and as the dry powder. Reconstituted solutions remain stable for 24 hours at room temperature and 96 hours when refrigerated.

Ophthalmic solution: Store at 8°C to 27°C (46°F to 80°F).

Solution, for inhalation (TOBI®): Store under refrigeration at 2°C to 8°C (36°F to 46°F). May be stored in foil pouch at room temperature of 25°C (77°F) for up to 28 days. Avoid intense light. Solution may darken over time; however, do not use if cloudy or contains particles.

ReconstitutionDilute in 50-100 mL NS, D_5W for I.V. infusion.

CompatibilityStable in dextran 40 10% in dextrose, D_5NS, D_5W, $D_{10}W$, mannitol 20%, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, alatrofloxacin, amifostine, amiodarone, amsacrine, aztreonam, ciprofloxacin, cisatracurium, cyclophosphamide, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, filgrastim, fluconazole, fludarabine, foscarnet, furosemide, gatifloxacin, gemcitabine, granisetron, hydromorphone, IL-2, insulin (regular), labetalol, linezolid, magnesium sulfate, melphalan, meperidine, midazolam, morphine, perphenazine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, vinorelbine, zidovudine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefoperazone, heparin, hetastarch, indomethacin, propofol, sargramostim.

Compatibility in syringe: Compatible: Doxapram. **Incompatible:** Cefamandole, clindamycin, heparin.

Compatibility when admixed: Compatible: Aztreonam, bleomycin, calcium gluconate, cefoxitin, ciprofloxacin, clindamycin, furosemide, metronidazole, metronidazole with sodium bicarbonate, ofloxacin, ranitidine, verapamil. **Incompatible:** Cefamandole, cefepime, cefotaxime, cefotetan, floxacillin, heparin.

ContraindicationsHypersensitivity to tobramycin, other aminoglycosides, or any component of the formulation; pregnancy (injection/inhalation)

Warnings/Precautions

Boxed warnings:

- Nephrotoxicity: See "Concerns related to adverse effects" below.
- Neurotoxicity: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity;** usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.

- Neuromuscular blockade and respiratory paralysis: May cause neuromuscular blockade and respiratory paralysis; especially when given soon after anesthesia or muscle relaxants.

- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity;** usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hearing impairment: Use with caution in patients with pre-existing vertigo, tinnitus, or hearing loss.

- Hypocalcemia: Use with caution in patients with hypocalcemia.

- Neuromuscular disorders: Use with caution in patients with neuromuscular disorders, including myasthenia gravis.

- Renal impairment: Use with caution in patients with pre-existing renal insufficiency; dosage modification required.

Dosage form specific issues:

- Sulfite: Solution may contain sodium metabisulfate; use caution in patients with sulfite allergy.

Other warnings/precautions:

- Long-term use: Not intended for long-term therapy due to toxic hazards associated with extended administration.

Geriatric ConsiderationsThe aminoglycosides are an important therapeutic intervention for susceptible organisms and as empiric therapy in seriously ill patients. Their use is not without risk of toxicity; however, these risks can be minimized if initial dosing is adjusted for estimated renal function and appropriate monitoring is performed. High dose, once daily aminoglycosides have been advocated as an alternative to traditional dosing regimens. Once daily or extended interval dosing is as effective and may be safer than traditional dosing. Interval must be adjusted for renal function.

Pregnancy Risk FactorD (injection, inhalation); B (ophthalmic)

Pregnancy ConsiderationsTobramycin crosses the placenta and produces detectable serum levels in the fetus. Because of several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy, the manufacturer classifies systemic tobramycin as pregnancy risk factor D. There have been no reports of fetal toxicity in humans from tobramycin. No adequate and well-controlled studies have been conducted in pregnant women and it is not known whether tobramycin can cause fetal harm. Although the manufacturer considers tobramycin pregnancy risk factor D, tobramycin-specific clinical data would suggest a pregnancy risk factor C.

Due to pregnancy induced physiologic changes, some pharmacokinetic parameters of tobramycin may be altered. Pregnant women have an average-to-larger volume of distribution which may result in lower serum peak levels than for the same dose in nonpregnant women. Serum half-life is also shorter.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsTobramycin is excreted into breast milk; however, it is not well absorbed when taken orally. This limited oral absorption may minimize exposure to the nursing infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Tobramycin in Pregnancy & Lactation

Adverse Reactions

Injection: Frequency not defined:

Central nervous system: Confusion, disorientation, dizziness, fever, headache, lethargy, vertigo

Dermatologic: Exfoliative dermatitis, itching, rash, urticaria

Endocrine & metabolic: Serum calcium, magnesium, potassium, and/or sodium decreased

Gastrointestinal: Diarrhea, nausea, vomiting

Hematologic: Anemia, eosinophilia, granulocytopenia, leukocytosis, leukopenia, thrombocytopenia

Hepatic: ALT increased, AST increased, bilirubin increased, LDH increased

Local: Pain at the injection site

Otic: Hearing loss, tinnitus, ototoxicity (auditory), ototoxicity (vestibular), roaring in the ears

Renal: BUN increased, cylindruria, serum creatinine increased, oliguria, proteinuria

Inhalation:

>10%:

Gastrointestinal: Sputum discoloration (21%)

Respiratory: Voice alteration (13%)

1% to 10%:

Central nervous system: Malaise (6%)

Otic: Tinnitus (3%)

Postmarketing and/or case reports: Hearing loss

Ophthalmic: <1%: Ocular: Conjunctival erythema, lid itching, lid swelling

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Test InteractionsSome penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersUrinalysis, urine output, BUN, serum creatinine, peak and trough plasma tobramycin levels; be alert to ototoxicity; hearing should be tested before and during treatment

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*. This may be clinically-significant for certain penicillin (ticarcillin, piperacillin, carbenicillin) and aminoglycoside (gentamicin, tobramycin) combination therapy in patients with significant renal impairment. Close monitoring of aminoglycoside levels is warranted.

Reference Range

Timing of serum samples: Draw peak 30 minutes after 30-minute infusion has been completed or 1 hour following I.M. injection or beginning of infusion; draw trough immediately before next dose

Therapeutic levels:

Peak:

Serious infections: 6-8 mcg/mL (SI: 12-17 µmol/L)

Life-threatening infections: 8-10 mcg/mL (SI: 17-21 µmol/L)

Urinary tract infections: 4-6 mcg/mL (SI: 7-12 µmol/L)

Synergy against gram-positive organisms: 3-5 mcg/mL

Trough:

Serious infections: 0.5-1 mcg/mL

Life-threatening infections: 1-2 mcg/mL

The American Thoracic Society (ATS) recommends trough levels of <1 mcg/mL for patients with hospital-acquired pneumonia.

Monitor serum creatinine and urine output; obtain drug levels after the third dose unless otherwise directed

Inhalation: Serum levels are ~1 mcg/mL one hour following a 300 mg dose in patients with normal renal function.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess patient's hearing level before, during, and following therapy. Monitor therapeutic effectiveness, laboratory values, and adverse reactions (eg, ototoxicity and nephrotoxicity) at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsUrinalysis, BUN, serum creatinine, plasma tobramycin levels (as appropriate to dosing method). Peak levels are drawn 30 minutes after the end of a 30-minute infusion or 1 hour after initiation of infusion or I.M. injection. The trough is drawn just before the next dose. Levels are typically obtained after the third dose in conventional dosing. Perform culture and sensitivity studies prior to initiating therapy to determine the causative organism and its susceptibility to tobramycin. Some penicillin derivatives may accelerate the degradation of aminoglycosides.

Patient EducationSystemic: Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Report decreased urine output, swelling of extremities, respiratory difficulty, vaginal itching or discharge, rash, diarrhea, oral thrush, unhealed wounds, dizziness, change in hearing acuity or ringing in ears, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Ophthalmic: Use as frequently as recommended; do not overuse. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Sit down, tilt head back, instill solution or drops inside lower eyelid, and roll eyeball in all directions. Close eye and apply gentle pressure to inner corner of eye for 30 seconds. May experience temporary stinging or blurred vision. Do not use any other eye preparation for 10 minutes. Inform prescriber if condition worsens or does not improve in 3-4 days.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in NS]: 60 mg (50 mL); 80 mg (100 mL)

Injection, powder for reconstitution: 1.2 g

Injection, solution: 10 mg/mL (2 mL, 8 mL); 40 mg/mL (2 mL, 30 mL, 50 mL) [may contain sodium metabisulfite]

Ointment, ophthalmic (Tobrex®): 0.3% (3.5 g)

Solution for nebulization [preservative free] (TOBI®): 60 mg/mL (5 mL)

Solution, ophthalmic (AKTob®, Tobrex®): 0.3% (5 mL) [contains benzalkonium chloride]

Generic AvailableYes: Excludes ophthalmic ointment, solution for nebulization

Pricing: U.S. (www.drugstore.com)

Nebulization (Tobi)

300 mg/5 mL (280): $3988.68

Ointment (Tobrex)

0.3% (3.5): $71.24

Solution (Tobramycin Sulfate)

0.3% (5): $15.99

40 mg/mL (8): $8.99

40 mg/mL (30): $35.99

Solution (Tobrex)

0.3% (5): $59.99

Mechanism of ActionInterferes with bacterial protein synthesis by binding to 30S and 50S ribosomal subunits resulting in a defective bacterial cell membrane

Pharmacodynamics/Kinetics

Absorption:

Oral: Poorly absorbed

I.M.: Rapid and complete

Inhalation: Peak serum concentrations are ~1 mcg/mL following a 300 mg dose

Distribution: V_d: 0.2-0.3 L/kg; Pediatrics: 0.2-0.7 L/kg; to extracellular fluid including serum, abscesses, ascitic, pericardial, pleural, synovial, lymphatic, and peritoneal fluids; poor penetration into CSF, eye, bone, prostate

Inhalation: Tobramycin remains concentrated primarily in the airways

Protein binding: <30%

Half-life elimination:

Neonates: ≤1200 g: 11 hours; >1200 g: 2-9 hours

Adults: 2-3 hours; directly dependent upon glomerular filtration rate

Adults with impaired renal function: 5-70 hours

Time to peak, serum: I.M.: 30-60 minutes; I.V.: ~30 minutes

Excretion: Normal renal function: Urine (~90% to 95%) within 24 hours

Related Information

- Antimicrobial Drugs of Choice

Pharmacotherapy PearlsOnce-daily dosing: Higher peak serum drug concentration to MIC ratios, demonstrated aminoglycoside postantibiotic effect, decreased renal cortex drug uptake, and improved cost-time efficiency are supportive reasons for the use of once daily dosing regimens for aminoglycosides. Current research indicates these regimens to be as effective for non-life-threatening infections, with no higher incidence of nephrotoxicity, than those requiring multiple daily doses. Doses are determined by calculating the entire day's dose via usual multiple dose calculation techniques and administering this quantity as a single dose. Doses are then adjusted to maintain mean serum concentrations above the MIC(s) of the causative organism(s). (Example: 2.5-5 mg/kg as a single dose; expected Cp_{max}: 10-20 mcg/mL and Cp_{min}: <1 mcg/mL). Further research is needed for universal recommendation in all patient populations and gram-negative disease; exceptions may include those with known high clearance (eg, children, patients with cystic fibrosis, or burns who may require shorter dosage intervals) and patients with renal function impairment for whom longer than conventional dosage intervals are usually required.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTobramycin Sulfate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Tonocard® may be confused with Torecan®

Pronunciation(TOE kay nide)

U.S. Brand NamesTonocard® [DSC]

Pharmacologic CategoryAntiarrhythmic Agent, Class Ib

Use: Labeled IndicationsSuppression and prevention of symptomatic life-threatening ventricular arrhythmias

Use: Unlabeled/InvestigationalTrigeminal neuralgia

Dosing: Adults**Ventricular arrhythmias:** Oral: 1200-1800 mg/day in 3 divided doses, up to 2400 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Administer 50% of normal dose or 600 mg once daily.

Moderately dialyzable (20% to 50%)

Dosing: Hepatic ImpairmentMaximum daily dose: 1200 mg

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsShould be taken with food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Keep container tightly closed.

ContraindicationsHypersensitivity to tocainide, any component of the formulation, or any local anesthetics of the amide type; second- or third-degree heart block (except in patients with a functioning artificial pacemaker)

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Boxed warnings:

- Blood dyscrasias: See “Concerns related to adverse effects” below.
- CAST trial: See “Other warnings/precautions” below.
- Pulmonary fibrosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Blood dyscrasias: **[U.S. Boxed Warning]: During the first 3 months of therapy, blood dyscrasias (eg, agranulocytosis, leukopenia, neutropenia, aplastic/hypoplastic anemia, thrombocytopenia) can rarely occur.**
- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.
- Pulmonary fibrosis: **[U.S. Boxed Warning]: Pulmonary fibrosis, interstitial pneumonitis, fibrosing alveolitis, pulmonary edema, and pneumonia have been reported with use (fatalities have occurred);** monitor for pulmonary symptoms.

Disease-related concerns:

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Heart failure (HF): Use with caution in patients with HF; may precipitate or exacerbate condition.
- Hepatic impairment: Use with caution in patients with significant hepatic impairment; dosage adjustment recommended.
- Renal impairment: Use with caution in patients with significant renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- CAST trial: **[U.S. Boxed Warning]: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide.** An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsTocainide may cause confusion. Tremor indicates potential toxicity and should not be mistaken for age related changes. Renal and Phase I liver metabolism changes with age may affect clearance. Monitor closely since half-life may be prolonged.
Pregnancy Risk FactorC
LactationEnters breast milk/contraindicated
Breast-Feeding ConsiderationsTocainide is secreted in breast milk. The manufacturer recommends discontinuation of breast-feeding during treatment or discontinuation of tocainide, based upon risk:benefit to the mother.
Adverse Reactions

>10%:

Central nervous system: Dizziness (8% to 15%)

Gastrointestinal: Nausea (14% to 15%)

1% to 10%:

Cardiovascular: Tachycardia (3%), bradycardia/angina/palpitation (0.5% to 1.8%), hypotension (3%)

Central nervous system: Nervousness (0.5% to 1.5%), confusion (2% to 3%), headache (4.6%), anxiety, incoordination, giddiness, vertigo

Dermatologic: Rash (0.5% to 8.4%)

Gastrointestinal: Vomiting (4.5%), diarrhea (4% to 5%), anorexia (1% to 2%), loss of taste

Neuromuscular & skeletal: Paresthesia (3.5% to 9%), tremor (dose related: 2.9% to 8.4%), ataxia (dose related: 2.9% to 8.4%), hot and cold sensations

Ocular: Blurred vision (~1.5%), nystagmus (1%)

<1% (Limited to important or life-threatening): Abdominal pain, abnormal liver function tests, agitation, alopecia, angina, asthenia, AV block, cardiomegaly, chills, cinchonism, coma, constipation, convulsions, decreased mental acuity, delirium, depression, diaphoresis, diplopia, dysarthria, dyspepsia, dysphagia, dyspnea, earache, edema, erythema multiforme, exfoliative dermatitis, fever, fibrosing alveolitis, hallucinations, hepatitis, hiccup, hypersensitivity reactions, hypertension, impaired memory, increased ANA, increased QRS duration, insomnia, interstitial pneumonitis, jaundice, local anesthesia, malaise, muscle cramps, myasthenia gravis, neck pain, orthostatic hypotension, pallor, pancreatitis, pericarditis, pneumonia, polyuria, prolonged QT interval, pruritus, psychic disturbances, psychosis, pulmonary edema, pulmonary embolism, pulmonary fibrosis, respiratory arrest, right bundle branch block, sinoatrial block, sinus arrest, sleep disturbance, slurred speech, Stevens-Johnson syndrome, stomatitis, syncope, taste perversion, urinary retention, urticaria, vasculitis, vasovagal episodes, xerostomia, yawning

Postmarketing and/or case reports: Pericarditis, immune complex glomerulonephritis, granulomatous hepatitis

Note: Rare, potentially severe hematologic reactions, have occurred (generally within the first 12 weeks of therapy). These may include agranulocytosis, bone marrow depression, aplastic anemia, hypoplastic anemia, hemolytic anemia, anemia, leukopenia, neutropenia, thrombocytopenia, and eosinophilia.

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak)
Drug Interactions

Antacids: May increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Tocainide. *Risk C: Monitor therapy*

Monitoring ParametersMonitor for tremor; titration of dosing and initiation of therapy require cardiac monitoring
Reference RangeTherapeutic: 5-12 mcg/mL (SI: 22-52 µmol/L)
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions (see Drug Interactions). See Warnings/Precautions and Contraindications for use cautions. Monitor therapeutic effectiveness and adverse reactions (see Warnings/Precautions and Adverse Reactions) at beginning of therapy, when titrating dosage, and on a regular basis with long-term oral therapy. **Note:** Tocainide has a low TI and overdose may easily produce severe and life-threatening reactions (see Overdose/Toxicology). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Breast-feeding is contraindicated.
Patient EducationTake exactly as directed with food. If dose is missed, take as soon as possible, do not double next dose. Do not discontinue without consulting prescriber. You will need regular cardiac checkups while taking this medication. You may experience dizziness, nervousness, or visual changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or mild muscle discomfort (analgesics may be recommended). Report chest pain, palpitations, or erratic heartbeat; respiratory difficulty or unusual cough; mental confusion or depression; muscle tremor, weakness, or pain; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as hydrochloride [DSC]: 400 mg, 600 mg

Generic AvailableNo
ManufacturerAstraZeneca Pharmaceuticals LP
Mechanism of ActionClass 1B antiarrhythmic agent; suppresses automaticity of conduction tissue, by increasing electrical stimulation threshold of ventricle, His-Purkinje system, and spontaneous depolarization of the ventricles during diastole by a direct action on the tissues; blocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction
Pharmacodynamics/Kinetics

Absorption: Oral: 99% to 100%

Distribution: V_d: 1.62-3.2 L/kg

Protein binding: 10% to 20%

Metabolism: Hepatic to inactive metabolites; negligible first-pass effect

Half-life elimination: 11-14 hours; Renal and hepatic impairment: 23-27 hours

Time to peak, serum: 30-160 minutes

Excretion: Urine (40% to 50% as unchanged drug)

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Loss of taste.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness or confusion
Mental Health: Effects on Psychiatric TreatmentMay cause agranulocytosis; use caution with clozapine and carbamazepine; barbiturates may decrease the serum levels of tocainide
Cardiovascular ConsiderationsThe prophylactic use of tocainide in patients after myocardial infarction confers no benefit and in fact may be harmful. Great care is needed in administration of tocainide in the elderly and in patients with heart failure, shock, or hepatic disease, as toxic effects of tocainide may become evident earlier in these patients. This is especially problematic since tocainide-induced seizures may induce extension of underlying myocardial infarction. It is important to recognize that tocainide has a narrow therapeutic index. Severe toxicity may occur at doses slightly above the therapeutic range, particularly when tocainide is administered together with other antiarrhythmic drugs. While tocainide toxicity may elicit seizures, tocainide may also cause respiratory arrest and cardiac toxicity (AV block, asystole, and hypotension).

Medication Safety Issues

Sound-alike/look-alike issues:

TOLAZamide may be confused with tolazoline, TOLBUTamide

Tolinase® may be confused with Orinase®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(tole AZ a mide)

Canadian Brand NamesTolinase®

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsAdjunct to diet for the management of mild to moderately severe, stable, type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Dosing: Adults

Type 2 diabetes: Oral (doses >500 mg/day should be given in 2 divided doses):

Initial: 100-250 mg/day with breakfast or the first main meal of the day

Fasting blood sugar <200 mg/dL: 100 mg/day

Fasting blood sugar >200 mg/dL: 250 mg/day

Patient is malnourished, underweight, elderly, or not eating properly: 100 mg/day

Adjustment/titration: Increase in increments of 100-250 mg/day at weekly intervals to response; maximum daily dose: 1 g (doses >1 g/day are not likely to improve control)

Conversion from insulin to tolazamide

<20 units day = 100 mg/day

21-<40 units/day = 250 mg/day

≥40 units/day = 250 mg/day and 50% of insulin dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentConservative initial and maintenance doses are recommended because tolazamide is metabolized to active metabolites, which are eliminated in the urine.

Dosing: Hepatic ImpairmentConservative initial and maintenance doses and careful monitoring of blood glucose are recommended.

ContraindicationsHypersensitivity to tolazamide, sulfonylureas, or any component of the formulation; type 1 diabetes mellitus (insulin dependent, IDDM) therapy; diabetic ketoacidosis

Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.
- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsHas not been studied in elderly patients, however, except for drug interactions it appears to have a safe profile and decline in renal function does not affect its pharmacokinetics. How “tightly” an elderly patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal studies; therefore, tolazamide is classified as pregnancy category C. Severe hypoglycemia lasting 4-10 days has been noted in infants born to mothers taking a sulfonylurea at the time of delivery. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. The manufacturer recommends if tolazamide is used during pregnancy, it should be discontinued at least 2 weeks before the expected delivery date. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if tolazamide is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. Potentially, hypoglycemia may occur in a nursing infant exposed to a sulfonylurea via breast milk.

Pregnancy & Lactation, In-Depth

- TOLAZamide in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, fatigue, headache, malaise, vertigo

Dermatologic: Maculopapular eruptions, morbilliform eruptions, photosensitivity, pruritus, rash, urticaria

Endocrine & metabolic: Disulfiram-like reaction, hypoglycemia, hyponatremia, SIADH

Gastrointestinal: Anorexia, constipation, diarrhea, epigastric fullness, heartburn, nausea, vomiting

Hematologic: Agranulocytosis, aplastic anemia, hemolytic anemia, leukopenia, pancytopenia, porphyria cutanea tarda, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatic porphyria

Neuromuscular & skeletal: Weakness

Renal: Diuretic effect

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (possible disulfiram-like reaction).

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of tolazamide. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle.

Monitoring ParametersSigns and symptoms of hypoglycemia (fatigue, sweating, numbness of extremities); blood glucose; hemoglobin A_{1c}

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Monitoring: Lab TestsBlood glucose; hemoglobin A_{1c}

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 250 mg, 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (TOLAZamide)

100 mg (60): $23.99

250 mg (60): $35.24

500 mg (30): $34.99

Mechanism of ActionStimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Pharmacodynamics/Kinetics

Onset of hypoglycemic effect: 20 minutes

Peak hypoglycemic effect: 4-6 hours

Duration: 10-24 hours

Absorption: Rapid

Protein binding: 94%

Metabolism: Extensively hepatic to 5 metabolites (activity 0% to 70%)

Half-life elimination: 7 hours

Time to peak, serum: 3-4 hours

Excretion: Urine (85%); feces (7%)

Related Information

- Diabetes Mellitus Management, Adults
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentUse salicylates with caution in patients taking tolazamide due to potential increased hypoglycemia; NSAIDs such as ibuprofen and naproxen may be safely used. Tolazamide-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentMay cause agranulocytosis; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce alterations in serum glucose concentrations; monitor glucose; clinical manifestation of hypoglycemia may be blocked by beta-blockers

Cardiovascular Considerations The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Medication Safety Issues

Sound-alike/look-alike issues:

Tolazoline may be confused with TOLAZamide

Priscoline® may be confused with Apresoline®

Pronunciation(tole AZ oh leen)

U.S. Brand NamesPriscoline® [DSC]

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsTreatment of persistent pulmonary vasoconstriction and hypertension of the newborn (persistent fetal circulation), peripheral vasospastic disorders

Dosing: Adults**Peripheral vasospastic disorder:** I.M., I.V., SubQ: 10-50 mg 4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Persistent pulmonary vasoconstriction and hypertension of the newborn (persistent fetal circulation):**

I.V.: Neonates: Initial: 1-2 mg/kg over 10-15 minutes via scalp vein or upper extremity; maintenance: 1-2 mg/kg/hour; use lower maintenance doses in patients with decreased renal function. Also used in neonates for acute vasospasm “cath toes” at 0.25 mg/kg/hour (no load); maximum dose: 6-8 mg/kg/hour.

Dosing interval in renal impairment in newborns: Urine output <0.9 mL/kg/hour: Decrease dose to 0.08 mg/kg/hour for every 1 mg/kg of loading dose

Dosing: Renal ImpairmentNewborns: Urine output <0.9 mL/kg/hour: Decrease dose to 0.08 mg/kg/hour for every 1 mg/kg of loading dose.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, LR, $^1/_2$NS, NS.

Y-site administration: Compatible: Aminophylline, ampicillin, calcium gluconate, cefotaxime, cimetidine, dobutamine, dopamine, furosemide, gentamicin, phytonadione, sodium bicarbonate, tobramycin, vancomycin. **Incompatible:** Indomethacin.

Compatibility when admixed: Compatible: Verapamil. **Incompatible:** Ethacrynate sodium.

ContraindicationsHypersensitivity to tolazoline or any component of the formulation; known or suspected coronary artery disease

Warnings/Precautions

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with gastritis and/or peptic ulcer; stimulates gastric secretion and may activate stress ulcers.
- Mitral stenosis: Use with caution in patients with mitral stenosis.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, hyper-/hypotension, peripheral vasodilation, tachycardia

Endocrine & metabolic: Hypochloremic alkalosis

Gastrointestinal: Abdominal pain, diarrhea, GI bleeding, nausea

Hematologic: Agranulocytosis increased, pancytopenia, thrombocytopenia

Local: Burning at injection site

Neuromuscular & skeletal: Pilomotor activity increased

Ocular: Mydriasis

Renal: Acute renal failure, oliguria

Respiratory: Pulmonary hemorrhage

Miscellaneous: Increased secretions

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can

not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase vasodilation).

Monitoring ParametersVital signs, blood gases, cardiac monitor

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution, as hydrochloride [DSC]: 25 mg/mL (4 mL)

Generic AvailableNo

Mechanism of ActionCompetitively blocks alpha-adrenergic receptors to produce brief antagonism of circulating epinephrine and norepinephrine; reduces hypertension caused by catecholamines and causes vascular smooth muscle relaxation (direct action); results in peripheral vasodilation and decreased peripheral resistance

Pharmacodynamics/Kinetics

Half-life elimination: Neonates: 3-10 hours; prolonged with renal impairment

Time to peak, serum: Within 30 minutes

Excretion: Urine (primarily as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause agranulocytosis, caution with clozapine and carbamazepine; use with ethanol may produce “disulfiram reaction”

Anesthesia and Critical Care Concerns/Other ConsiderationsAcidosis may decrease tolazoline's effects.

Index TermsBenzazoline Hydrochloride; Tolazoline Hydrochloride

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

TOLBUTamide may be confused with terbutaline, TOLAZamide

Orinase® may be confused with Orabase®, Ornex®, Tolinase®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(tole BYOO ta mide)

Canadian Brand NamesApo-Tolbutamide®

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea

Use: Labeled IndicationsAdjunct to diet for the management of type 2 diabetes mellitus (noninsulin dependent, NIDDM)

Dosing: Adults**Type 2 diabetes:** Oral: Initial: 1-2 g/day as a single dose in the morning or in divided doses throughout the day. Maintenance dose: 0.25-3 g/day; however, a maintenance dose >2 g/day is seldom required. **Note:** Divided doses may improve gastrointestinal tolerance

Dosing: ElderlyInitial: 250 mg 1-3 times/day; usual: 500-2000 mg; maximum: 3 g/day

Dosing: Renal ImpairmentAdjustment is not necessary.

Hemodialysis: Not dialyzable (0% to 5%)

Dosing: Hepatic ImpairmentReduced dose may be necessary.

Administration: OralOral: Entire dose can be administered in AM, divided doses may improve GI tolerance

ContraindicationsHypersensitivity to tolbutamide, sulfonylureas, or any component of the formulation; treatment of type 1 diabetes; diabetic ketoacidosis

Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse reactions:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.
- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsBecause of its low potency and short duration, it is a useful agent in elderly if drug interactions can be avoided. How “tightly” an elderly patient's blood glucose should be controlled is controversial; however, a fasting blood sugar <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal studies; therefore, tolbutamide is classified as pregnancy category

C. Tolbutamide crosses the placenta and levels can be measured in the serum of newborn infants following maternal use during pregnancy. Teratogenic effects have been noted in some case reports. Prolonged hyperinsulinemic hypoglycemia has been reported in an infant following maternal use of tolbutamide and severe hypoglycemia lasting 4-10 days has been noted in infants born to mothers taking a sulfonylurea at the time of delivery. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. The manufacturer recommends if tolbutamide is used during pregnancy, it should be discontinued at least 2 weeks before the expected delivery date. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsTolbutamide is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. The AAP considers tolbutamide to be “usually compatible with breast-feeding.” Potentially, hypoglycemia may occur in a nursing infant exposed to a sulfonylurea via breast milk.

Pregnancy & Lactation, In-Depth

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (possible disulfiram-like reaction).

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of tolbutamide. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle.

Monitoring ParametersBlood glucose, hemoglobin A_{1c}; signs and symptoms of hypoglycemia

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests and therapeutic effectiveness, frequently during therapy. Monitor for adverse response (hypoglycemia). Assess knowledge/teach patient (or refer patient to diabetic educator for instruction) in appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBlood glucose, hemoglobin A_{1c}

Patient EducationThis medication is used to control diabetes; it is not a cure. Inform prescriber of all other prescription or OTC medications you are taking; do not introduce new medication without consulting prescriber. Do not take other medication within 2 hours of this medication unless advised by prescriber. Other components of treatment plan are important: Follow prescribed diet, medication, and exercise regimen. Take exactly as directed; at the same time each day. Do not change dose or discontinue without consulting prescriber. Avoid alcohol while taking this medication; could cause severe reaction. If you experience hypoglycemic reaction, contact prescriber immediately. Maintain regular dietary intake and exercise routine and always carry quick source of sugar with you. You may be more sensitive to sunlight (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). You may experience side effects during first weeks of therapy (headache, nausea, diarrhea, constipation, anorexia); consult prescriber if these persist. Report severe or persistent side effects, extended vomiting or flu-like symptoms, skin rash, easy bruising or bleeding, or change in color of urine or stool. **Pregnancy precaution:** Do not get pregnant; use appropriate contraceptive measures to prevent possible harm to the fetus.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (TOLBUTamide)

500 mg (60): $26.25

Mechanism of ActionStimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites, suppression of glucagon may also contribute

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Duration: Oral: 6-24 hours

Absorption: Oral: Rapid

Distribution: V_d: 0.15 L/kg

Protein binding: ~95% (concentration dependent)

Metabolism: Hepatic via CYP2C9 to hydroxymethyltolbutamide (mildly active) and carboxytolbutamide (inactive); metabolism does not appear to be affected by age

Half-life elimination: 4.5-6.5 hours (range: 4-25 hours)

Time to peak, serum: 3-4 hours

Excretion: Urine (75% to 85% primarily as metabolites); feces

Related Information

- Diabetes Mellitus Management, Adults
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste alteration.

Use salicylates with caution in patients taking tolazamide due to potential increased hypoglycemia; NSAIDs such as ibuprofen and naproxen may be safely used. Tolbutamide-dependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentMay cause agranulocytosis; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce alterations in serum glucose concentrations; monitor glucose; clinical manifestation of hypoglycemia may be blocked by beta-blockers

Cardiovascular ConsiderationsThe possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Index TermsTolbutamide Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(TOLE ka pone)

U.S. Brand NamesTasmar®

Pharmacologic CategoryAnti-Parkinson's Agent, COMT Inhibitor

Use: Labeled IndicationsAdjunct to levodopa and carbidopa for the treatment of signs and symptoms of idiopathic Parkinson's disease in patients with motor fluctuations not responsive to other therapies

Dosing: Adults**Note:** If clinical improvement is not observed after 3 weeks of therapy (regardless of dose), tolcapone treatment should be discontinued.

Parkinson's Disease: Oral: Initial: 100 mg 3 times/day; may increase as tolerated to 200 mg 3 times/day. **Note:** Levodopa dose may need to be decreased upon initiation of tolcapone (average reduction in clinical trials was 30%). As many as 70% of patients receiving levodopa doses >600 mg daily required levodopa dosage reduction in clinical trials. Patients with moderate-to-severe dyskinesia prior to initiation are also more likely to require dosage reduction.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment necessary for mild-moderate impairment. Use caution with severe impairment; no safety information available in patients with Cl_{cr}<25 mL/minute.

Dosing: Hepatic ImpairmentDo not use. Discontinue immediately if signs/symptoms of hepatic impairment develop.

Administration: OralMay be administered with or without food. In clinical studies, the first dose of the day was administered with carbidopa/levodopa, and the subsequent doses were administered 6 hours and 12 hours later.

Dietary ConsiderationsMay be taken without regard to food.

StorageStore at 20°C to 25°C (68°F to 77°F).

RestrictionsA patient signed consent form acknowledging the risks of hepatic injury should be obtained by the treating physician.

ContraindicationsHypersensitivity to tolcapone or any component of the formulation; history of liver disease or tolcapone-induced hepatocellular injury; nontraumatic rhabdomyolysis or hyperpyrexia and confusion

Allergy Considerations

- COMT Inhibitor Allergy

Warnings/Precautions

Boxed warnings:

- Liver injury: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Diarrhea: Has been associated with delayed development of diarrhea (onset after 2-12 weeks); use with caution in patients with lower gastrointestinal disease or an increased risk of dehydration.

- Hallucinations: May cause hallucinations, which may improve with reduction in levodopa therapy.

- Liver injury: **[U.S. Boxed Warning]: Due to reports of fatal liver injury associated with use of this drug, the manufacturer is advising that tolcapone be reserved for patients who are experiencing inadequate symptom control or who are not appropriate candidates for other available treatments.** Patients must provide written consent acknowledging the risks of hepatic injury. Liver disease should be excluded prior to initiation; laboratory monitoring is recommended. Discontinue if signs and/or symptoms of hepatic injury are noted (eg, transaminases >2 times upper limit of normal) or if clinical improvement is not evident after 3 weeks of therapy.

- Neuroleptic malignant syndrome: Tolcapone, in conjunction with other drug therapy that alters brain biogenic amine concentrations (eg, MAO inhibitors, SSRIs), has been associated with a syndrome resembling neuroleptic malignant syndrome (hyperpyrexia and confusion - some fatal) on abrupt withdrawal or dosage reduction. Concomitant use of tolcapone and nonselective MAO inhibitors should be avoided.

- Orthostatic hypotension: May cause orthostatic hypotension and syncope; Parkinson's disease patients appear to have an impaired capacity to respond to a postural challenge; use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk.

- Pleural/retroperitoneal fibrosis: Dopaminergic agents from the ergot class have been associated with fibrotic complications, such as retroperitoneal fibrosis, pulmonary infiltrates or effusion and pleural thickening. It is unknown whether non-ergot, pro-dopaminergic agents like tolcapone confer this risk.

- Rhabdomyolysis: Severe rhabdomyolysis has been reported with use.

Disease-related concerns:

- Dyskinesia: Use with caution in patients with pre-existing dyskinesias; exacerbation of pre-existing dyskinesia has been reported. Levodopa dosage reduction may be required, particularly in patients with levodopa dosages >600 mg daily or with moderate-to-severe dyskinesia prior to initiation.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with severe renal impairment.

Concurrent drug therapy issues:

- MAO inhibitors: Concomitant use of tolcapone and nonselective MAO inhibitors should be avoided. Selegiline is a selective MAO type B inhibitor (when given orally at ≤10 mg/day) and can be taken with tolcapone.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo specific data in elderly patients, but based on the pharmacokinetic profile, no dosage adjustment appears necessary.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTolcapone may be teratogenic based on animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Cardiovascular: Orthostatic hypotension (17%)

Central nervous system: Sleep disorder (24% to 25%), excessive dreaming (16% to 21%), somnolence (14% to 32%), hallucinations (8% to 24%) dizziness (6% to 13%), headache (10% to 11%), confusion (10% to 11%)

Gastrointestinal: Nausea (28% to 50%), anorexia (19% to 23%), diarrhea (16% to 34%; approximately 3% to 4% severe)

Neuromuscular & skeletal: Dyskinesia (42% to 51%), dystonia (19% to 22%), muscle cramps (17% to 18%)

1% to 10%:

Cardiovascular: Syncope (4% to 5%), chest pain (1% to 3%), hypotension (2%), palpitation

Central nervous system: Fatigue (3% to 7%), loss of balance (2% to 3%), agitation (1%), euphoria (1%), hyperactivity (1%), malaise (1%), panic reaction (1%), irritability (1%), mental deficiency (1%), fever (1%), depression, hypoesthesia, tremor, speech disorder, vertigo, emotional lability, hyperkinesia

Dermatologic: Alopecia (1%), bleeding (1%), tumor (1%), rash

Gastrointestinal: Vomiting (8% to 10%), constipation (6% to 8%), xerostomia (5% to 6%), abdominal pain (5% to 6%), dyspepsia (3% to 4%), flatulence (2% to 4%), tooth disorder

Genitourinary: UTI (5%), hematuria (4% to 5%), urine discoloration (2% to 3%), urination disorder (1% to 2%), uterine tumor (1%), incontinence, impotence

Hepatic: Transaminases increased (1% to 3%; 3 times ULN, usually with first 6 months of therapy)

Neuromuscular & skeletal: Paresthesia (1% to 3%), hyper-/hypokinesia (1% to 3%), arthritis (1% to 2%), neck pain (2%), stiffness (2%), myalgia, rhabdomyolysis

Ocular: Cataract (1%), eye inflammation (1%)

Otic: Tinnitus

Respiratory: Upper respiratory infection (5% to 7%), dyspnea (3%), sinus congestion (1% to 2%), bronchitis, pharyngitis

Miscellaneous: Diaphoresis (4% to 7%), influenza (3% to 4%), burning (1% to 2%), flank pain, injury, infection

<1%: Abnormal stools, abscess, allergic reaction, amnesia, anemia, antisocial reaction, apathy, apnea, arteriosclerosis, arthrosis, asthma, bladder calculus, breast neoplasm, carcinoma, cardiovascular disorder, cellulitis, cerebral ischemia, cerebrovascular accident, chills, cholecystitis, cholelithiasis, choreoathetosis, colitis, cough increased, death, dehydration, delirium, delusions, diabetes mellitus, diplopia, duodenal ulcer, dysphagia, dysuria, ear pain, eczema, edema, encephalopathy, epistaxis, erythema multiforme, esophagitis, extrapyramidal syndrome, eye hemorrhage, eye pain, facial edema, furunculosis, gastroenteritis, gastrointestinal carcinoma, gastrointestinal hemorrhage, glaucoma, hemiplegia, hernia, herpes simplex, herpes zoster, hiccup, hostility, hypercholesteremia, hyperventilation, hypoxia, infection (bacterial), infection (fungal), joint disorder, kidney calculus, lacrimation disorder, laryngitis, leukemia, libido changes, lung edema, manic reaction, meningitis, mouth ulceration, myoclonus, neoplasm, nervousness, neuralgia, neuropathy, nocturia, oliguria, otitis media, ovarian carcinoma, pain, paranoid reaction, parosmia, pericardial effusion, polyuria, prostatic carcinoma, prostatic disorder, pruritus, psychosis, rectal disorder, rhinitis, salivation increased, seborrhea, skin discoloration, skin disorder, stomach atony, surgical procedure, tenosynovitis, thinking abnormal, thirst, thrombocytopenia, thrombosis, tongue disorder, twitching, urinary retention, urinary tract disorder, urticaria, uterine atony, uterine disorder, uterine hemorrhage, vaginitis, viral infection

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Substrates: COMT Inhibitors may decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: COMT Inhibitors may enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Tolcapone, taken with food within 1 hour before or 2 hours after the dose, decreases bioavailability by 10% to 20%.

Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersBlood pressure, symptoms of Parkinson's disease, liver enzymes at baseline and then every 2-4 weeks for the first 6 months of therapy; thereafter, periodic monitoring should be conducted as deemed clinically relevant. If the dose is increased to 200 mg 3 times/day, reinitiate LFT monitoring every 2-4 weeks for 6 months, and then resume periodic monitoring. Discontinue therapy if the ALT or AST exceeds 2 times ULN or if the clinical signs and symptoms suggest the onset of liver failure.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness (eg, mental status, involuntary movements) and adverse reactions at beginning of therapy and periodically throughout therapy. Monitor for CNS depression. Monitor blood pressure. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver enzymes at baseline and then every 2-4 weeks for the first 6 months of therapy; thereafter, periodic monitoring should be conducted as deemed clinically relevant. If the dose is increased to 200 mg 3 times/day, reinitiate LFT monitoring every 2-4 weeks for 6 months, and then resume periodic monitoring. Discontinue therapy if the ALT or AST exceeds 2 times the upper limit of normal or if the clinical signs and symptoms suggest the onset of liver failure.

Patient EducationTake exactly as directed (may be prescribed in conjunction with levodopa/carbidopa); do not change dosage or discontinue without consulting prescriber. Therapeutic effects may take several weeks or months to achieve and you may need frequent monitoring during first weeks of therapy. Best to take 2 hours before or after a meal; however, may be taken with meals if GI upset occurs. Take at the same time each day. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol and prescription or OTC sedatives or CNS depressants without consulting prescriber. Urine or perspiration may appear darker. You may experience drowsiness, dizziness, confusion, or vision changes (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); orthostatic hypotension (use caution when changing position - rising to standing from sitting or lying); increased susceptibility to heat stroke, decreased perspiration (use caution in hot weather; maintain adequate fluids and reduce exercise activity); constipation (increased exercise, fluids, or fruit, or fiber may help); dry skin or nasal passages (consult prescriber for appropriate relief); or nausea, vomiting, loss of appetite, or stomach discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report unresolved constipation or vomiting; chest pain or irregular heartbeat; respiratory difficulty; acute headache or dizziness; CNS changes (hallucination, loss of memory, nervousness, etc); painful or difficult urination; unusual muscle cramping or pain; yellowing of skin or eyes; easy bruising or bleeding; dry, colored stools; abdominal pain or blood in stool; increased muscle spasticity, rigidity, or involuntary movements; skin rash or persistent itching; or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tasmar®: 100 mg, 200 mg

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Tasmar)

100 mg (90): $449.62

200 mg (90): $470.45

Mechanism of ActionTolcapone is a selective and reversible inhibitor of catechol-o-methyltransferase (COMT). In the presence of a decarboxylase inhibitor (eg, carbidopa), COMT is the major degradation pathway for levodopa. Inhibition of COMT leads to more sustained plasma levels of levodopa and enhanced central dopaminergic activity.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: 9 L

Protein binding: >99.0%

Metabolism: Hepatic, via glucuronidation, to inactive metabolite (>99%)

Bioavailability: 65%

Half-life elimination: 2-3 hours

Time to peak: ~2 hours

Excretion: Urine (60% as metabolites, 0.5% as unchanged drug); feces (40%)

Related Information

- Antiparkinsonian Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation) and tooth disorder.

Dopaminergic therapy in Parkinson's disease (ie, treatment with levodopa) is associated with orthostatic hypotension. Tolcapone enhances levodopa bioavailability and may increase the occurrence of hypotension/syncope in the dental patient. The patient should be carefully assisted from the chair and observed for signs of orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(TOLE met in)

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsTreatment of rheumatoid arthritis and osteoarthritis, juvenile rheumatoid arthritis

Dosing: Adults

Inflammation, arthritis: Oral: 400 mg 3 times/day; usual dose: 600 mg to 1.8 g/day; maximum: 1.8 g/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

JRA: Oral: Children ≥2 years: Initial: 20 mg/kg/day in 3-4 divided doses; Maintenance: 15-30 mg/kg/day in 3-4 divided doses (maximum 30 mg/kg/day)

Analgesic (unlabeled use): Oral: Children ≥2 years: 5-7 mg/kg/dose every 6-8 hours

Dietary ConsiderationsMay be taken with antacids to minimize stomach upset. Administration with food or milk decreases bioavailability by 16%. Sodium content: 200 mg: 0.8 mEq; 400 mg: 1.568 mEq; 600 mg: 2.35 mEq.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to tolmetin, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See "Concerns related to adverse effects" below.
- Coronary artery bypass graft surgery: See "Disease-related concerns" below.
- Gastrointestinal events: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.
Pregnancy Risk FactorC/D (3rd trimester)
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Use of NSAIDs late in pregnancy may cause premature closure of the ductus arteriosus and may inhibit uterine contractions.
LactationEnters breast milk/not recommended (AAP rates “compatible”)
Adverse Reactions

>10%: Gastrointestinal: Nausea 11%

1% to 10%:

Cardiovascular: Edema (3% to 9%), hypertension (3% to 9%), chest pain (1% to 3%)

Central nervous system: Dizziness (3% to 9%), headache (3% to 9%), depression (1% to 3%), drowsiness (1% to 3%)

Dermatologic: Skin irritation (1% to 3%)

Endocrine & metabolic: Weight gain/loss (3% to 9%)

Gastrointestinal: Abdominal pain (3% to 9%), diarrhea (3% to 9%), dyspepsia (3% to 9%), flatulence (3% to 9%), gastrointestinal distress (3% to 9%), vomiting (3% to 9%), constipation (1% to 3%), gastritis (1% to 3%), peptic ulcer (1% to 3%)

Genitourinary: Urinary tract infection (1% to 3%)

Hematologic: Hemoglobin/hematocrit decreased (transient; 1% to 3%)

Neuromuscular & skeletal: Weakness (3% to 9%)

Ocular: Visual disturbances (1% to 3%)

Otic: Tinnitus (1% to 3%)

Renal: BUN increased (1% to 3%)

<1%, postmarketing, and/or case reports: Agranulocytosis, anaphylactoid reactions, CHF, dysuria, epistaxis, erythema multiforme, exfoliative dermatitis, fever, fluid retention, GI bleeding, GI perforation, glossitis, granulocytopenia, hematuria, hemolytic anemia, hepatic failure, hepatic necrosis, hepatitis, hepatitis (fulminant), interstitial nephritis, jaundice, liver function tests (abnormal), lymphadenopathy, macular changes, nephrotic syndrome, optic neuropathy, proteinuria, purpura, renal failure, retinal changes, serum sickness, stomatitis, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, urticaria

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor

Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Tolmetin peak serum concentrations may be decreased if taken with food or milk.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, fenugreek, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersMonitor CBC, liver enzymes, occult blood loss; monitor urine output and BUN/ serum creatinine in patients receiving diuretics and ACE inhibitors, monitor blood pressure in patients receiving antihypertensives

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, GI bleeding, hepatotoxicity, ototoxicity) at beginning of therapy and periodically throughout therapy. Patients who are on long-term NSAID therapy should have periodic ophthalmic evaluations. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver enzymes, occult blood loss; monitor BUN/ serum creatinine in patients receiving diuretics and ACE inhibitors

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets or break capsules. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You should have regular ophthalmic evaluations when using NSAIDs for long periods of time. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, fruit, or fiber may help). GI bleeding, ulceration, or perforation can occur with or without pain. Discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report chest pain or palpitations; breathlessness or respiratory difficulty; slurring of speech; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; unusual fatigue; skin rash or itching; unusual weight gain or swelling of extremities; change in urinary pattern; or change in vision or hearing or ringing in ears. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 400 mg

Tablet: 200 mg, 600 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Tolmetin Sodium)

400 mg (90): $89.99

Tablets (Tolectin)

600 mg (100): $195.75

Tablets (Tolmetin Sodium)

200 mg (100): $53.06

600 mg (100): $143.07

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: 1-2 hours; Anti-inflammatory: Days to weeks

Absorption: Well absorbed, rapid

Bioavailability: Reduced 16% with food or milk

Half-life elimination: Biphasic: Rapid: 1-2 hours; Slow: 5 hours

Time to peak, serum: 30-60 minutes

Excretion: Urine (as inactive metabolites or conjugates) within 24 hours

Related Information

- Antacid Drug Interactions
- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentThe dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause drowsiness, confusion, insomnia, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A recent meta-analysis (see References) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Index TermsTolectin; Tolmetin Sodium

Tolnaftate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tolnaftate may be confused with Tornalate®

Tinactin® may be confused with Talacen®

Pronunciation(tole NAF tate)

U.S. Brand NamesBlis-To-Sol® [OTC]; FungiGuard [OTC]; Mycocide® NS [OTC]; Podactin Powder [OTC]; Tinactin® Antifungal Deodorant [OTC]; Tinactin® Antifungal Jock Itch [OTC]; Tinactin® Antifungal [OTC]; Tinaderm [OTC]; Ting® Cream [OTC]; Ting® Spray Liquid [OTC]

Canadian Brand NamesPitrex

Pharmacologic CategoryAntifungal Agent, Topical

Use: Labeled IndicationsTreatment of tinea pedis, tinea cruris, tinea corporis

Dosing: Adults**Tinea infection:** Topical: Wash and dry affected area; spray aerosol or apply 1-3 drops of solution or a small amount of cream, or powder and rub into the affected areas 2 times/day

Note: May use for up to 4 weeks for tinea pedis or tinea corporis, and up to 2 weeks for tinea cruris.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥2 years: Refer to adult dosing.

ContraindicationsHypersensitivity to tolnaftate or any component of the formulation; nail and scalp infections

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs.

Special populations:

- Pediatrics: Not for self-medication (OTC use) in children <2 years of age.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes. Apply to clean, dry skin. When used for self-medication (OTC use), contact health care provider if condition does not improve within 4 weeks.

Geriatric ConsiderationsNo specific recommendations for use in the elderly.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Pruritus, contact dermatitis

Local: Irritation, stinging

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical [spray]:

Tinactin® Antifungal: 1% (150 g) [contains ethanol 29% v/v]

Ting®: 1% (128 g) [contains ethanol 41% v/v]

Aerosol, topical [powder, spray]:

Tinactin® Antifungal Deodorant: 1% (133 g) [contains ethanol 11% v/v, talc]

Tinactin® Antifungal: 1% (133 g) [contains ethanol 11% v/v, talc]

Tinactin® Antifungal Jock Itch: 1% (133 g) [contains ethanol 11%, talc]

Cream, topical: 1% (15 g, 30 g)

FungiGuard, Tinactin® Antifungal Jock Itch, Ting®: 1% (15 g)

Tinactin® Antifungal: 1% (15 g, 30 g)

Liquid, topical:

Blis-To-Sol®: 1% (30 mL, 55 mL)

FungiGuard: 1% (30 mL) [contains vitamin E and aloe]

Liquid, topical [spray]:

Tinactin® Antifungal: 1% (59 mL) [contains ethanol 70% v/v]

Powder, topical: 1% (45 g)

Podactin: 1% (45 g)

Tinactin® Antifungal: 1% (108 g)

Solution, topical: 1% (10 mL)

Mycocide® NS: 1% (30 mL)

Tinaderm: 1% (10 mL)

Generic AvailableYes: Cream, powder, solution

Mechanism of ActionDistorts the hyphae and stunts mycelial growth in susceptible fungi

Pharmacodynamics/KineticsOnset of action: 24-72 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesAthlete's Foot (AR, HU); Athletes Foot Powder (IL); Chinofungin (HU, PL); Chlorisept (DE); Ezon-T (JP); Focusan (AT, CH, CZ, NL); Hi-Alarzin (JP); Myco-Aid (MY); Pedimycose (FR); Pitrex (IL); Ringworm Ointment (AU); Separin (JP); Sorgoa (DE, LU); Sporiline (FR); Tinaderm (AR, AU, CN, EC, ES, IE, IN, IT, MX, PE, PY, SG, VE, ZA); Tinaderm M (CO); Tinaderme (PT); Tinatox (DE); Tineafax (AU); Tolnadem (IN); Tolnaderm (MY, PH); Tolnaftat Puder N (DE); Tolnaftat Spray (DE); Tolsol (IN); Tono (TH); Tonoftal (DE)

Tolterodine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tolterodine may be confused with fesoterodine

Detrol® may be confused with Ditropan®

International issues:

Detrol® may be confused with Desurol® which is a brand name for oxolinic acid in the Czech Republic

Pronunciation(tole TER oh deen)

U.S. Brand NamesDetrol®; Detrol® LA

Canadian Brand NamesDetrol®; Detrol® LA; Unidet®

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled IndicationsTreatment of patients with an overactive bladder with symptoms of urinary frequency, urgency, or urge incontinence

Dosing: Adults**Treatment of overactive bladder:** Oral:

Immediate release tablet: 2 mg twice daily; the dose may be lowered to 1 mg twice daily based on individual response and tolerability

Dosing adjustment in patients concurrently taking CYP3A4 inhibitors: 1 mg twice daily

Extended release capsule: 4 mg once a day; dose may be lowered to 2 mg daily based on individual response and tolerability

Dosing adjustment in patients concurrently taking CYP3A4 inhibitors: 2 mg daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse with caution (studies conducted in patients with Cl_{cr} 10-30 mL/minute):

Immediate release tablet: 1 mg twice daily

Extended release capsule: 2 mg daily

Dosing: Hepatic Impairment

Immediate release tablet: 1 mg twice daily

Extended release capsule: 2 mg daily

Calculations

- Creatinine Clearance: Adults

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to tolterodine or any component of the formulation; urinary retention; gastric retention; uncontrolled narrow-angle glaucoma

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- QT prolongation: Has been associated with QT_c prolongation at high (supratherapeutic) doses. The manufacturer recommends caution in patients with congenital prolonged QT or in patients receiving concurrent therapy with QT_c-prolonging drugs (class Ia or III antiarrhythmics). However, the extent of QT_c prolongation even at supratherapeutic dosages was less than 15 msec. Individuals who are CYP2D6 poor metabolizers or in the presence of inhibitors of CYP2D6 and CYP3A4 may be more likely to exhibit prolongation.

Disease-related concerns:

- Bladder flow obstruction: Use with caution in patients with bladder flow obstruction; may increase the risk of urinary retention.
- Gastrointestinal obstructive disorders: Use with caution in patients with decreased GI motility or gastrointestinal obstructive disorders (ie, pyloric stenosis); may increase the risk of gastric retention.

- Glaucoma: Use with caution in patients with controlled (treated) narrow-angle glaucoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment is required.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment is required.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: Dosage adjustment is recommended in patients receiving CYP3A4 inhibitors; a lower dose of tolterodine is recommended. Also see QT prolongation in “Concerns related to adverse effects” above.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo difference in safety has been noted between elderly and younger patients, therefore, no dosage adjustment is recommended.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsAs reported with immediate release tablet, unless otherwise specified

>10%: Gastrointestinal: Dry mouth (35%; extended release capsules 23%)

1% to 10%:

Cardiovascular: Chest pain (2%)

Central nervous system: Headache (7%; extended release capsules 6%), somnolence (3%; extended release capsules 3%), fatigue (4%; extended release capsules 2%), dizziness (5%; extended release capsules 2%), anxiety (extended release capsules 1%)

Dermatologic: Dry skin (1%)

Gastrointestinal: Abdominal pain (5%; extended release capsules 4%), constipation (7%; extended release capsules 6%), dyspepsia (4%; extended release capsules 3%), diarrhea (4%), weight gain (1%)

Genitourinary: Dysuria (2%; extended release capsules 1%)

Neuromuscular & skeletal: Arthralgia (2%)

Ocular: Abnormal vision (2%; extended release capsules 1%), dry eyes (3%; extended release capsules 3%)

Respiratory: Bronchitis (2%), sinusitis (extended release capsules 2%)

Miscellaneous: Flu-like syndrome (3%), infection (1%)

Postmarketing and/or case reports: Anaphylactoid reactions, angioedema, confusion, dementia aggravated, disorientation, hallucinations, memory impairment, palpitation, peripheral edema, QT_c prolongation, tachycardia

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers")

Risk C: Monitor therapy

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

VinBLAStine: May increase the serum concentration of Tolterodine. Management: Reduce tolterodine dosage to 1 mg twice daily (regular release formulation) or 2 mg daily (extended release formulation) and monitor for increased levels/effects of tolterodine with initiation of vinblastine therapy. *Risk D: Consider therapy modification*

Warfarin: Tolterodine may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Increases bioavailability (~53% increase) of tolterodine tablets (dose adjustment not necessary); does not affect the pharmacokinetics of tolterodine extended release capsules. As a CYP3A4 inhibitor, grapefruit juice may increase the serum level and/or toxicity of tolterodine, but unlikely secondary to high oral bioavailability.

Herb/Nutraceutical: St John's wort (*Hypericum*) appears to induce CYP3A enzymes.

Monitoring ParametersRenal function (BUN, creatinine); hepatic function

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, ergot-containing drugs). Assess therapeutic effectiveness and adverse reactions. Teach patient appropriate use (according to formulation and purpose), interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsRenal function (BUN, creatinine); hepatic function

Patient EducationTake as directed, preferably with food. Do not break, crush, or chew extended release medication. May cause headache (consult prescriber for a mild analgesic); dry mouth; dizziness, nervousness, or sleepiness (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); or abdominal discomfort, diarrhea, constipation, nausea, or vomiting (small frequent meals, increased exercise, adequate hydration may help). Report back pain, muscle spasms, alteration in gait, or numbness of extremities; unresolved or persistent constipation, diarrhea, or vomiting; or symptoms of upper respiratory infection or flu. Report immediately any chest pain or palpitations, difficulty urinating, or pain on urination. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, as tartrate (Detrol® LA): 2 mg, 4 mg

Tablet, as tartrate (Detrol®): 1 mg, 2 mg

Generic AvailableNo

ManufacturerPharmacia & Upjohn

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Detrol LA)

2 mg (30): $119.99

4 mg (30): $126.98

Tablets (Detrol)

1 mg (60): $139.43

2 mg (60): $139.00

Mechanism of ActionTolterodine is a competitive antagonist of muscarinic receptors. In animal models, tolterodine demonstrates selectivity for urinary bladder receptors over salivary receptors. Urinary bladder contraction is mediated by muscarinic receptors. Tolterodine increases residual urine volume and decreases detrusor muscle pressure.

Pharmacodynamics/Kinetics

Absorption: Immediate release tablet: Rapid; ≥77%

Distribution: I.V.: V_d: 113 ± 27 L

Protein binding: >96% (primarily to alpha$_1$-acid glycoprotein)

Metabolism: Extensively hepatic, primarily via CYP2D6 (some metabolites share activity) and 3A4 usually (minor pathway). In patients with a genetic deficiency of CYP2D6, metabolism via 3A4 predominates.

Bioavailability: Immediate release tablet: Increased 53% with food

Half-life elimination:

Immediate release tablet: Extensive metabolizers: ~2 hours; Poor metabolizers: ~10 hours

Extended release capsule: Extensive metabolizers: ~7 hours; Poor metabolizers: ~18 hours

Time to peak: Immediate release tablet: 1-2 hours; Extended release tablet: 2-6 hours

Excretion: Urine (77%); feces (17%); primarily as metabolites (<1% unchanged drug) of which the active 5-hydroxymethyl metabolite accounts for 5% to 14% (<1% in poor metabolizers); as unchanged drug (<1%; <2.5% in poor metabolizers)

Dental Health: Effects on Dental Treatment The anticholinergic effects of tolterodine are selective for the urinary bladder rather than salivary glands; xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness, dizziness, hallucinations, or nervousness

Mental Health: Effects on Psychiatric Treatment Fluoxetine and likely paroxetine increase the serum concentration of tolterodine; however, the magnitude of this increase is small (~25%, as reported for fluoxetine) and thus no dosage adjustment is required.

Index Terms Tolterodine Tartrate

International Brand Names Detrodin SR (KP); Detrol SR (KP); Detrusitol (AE, AR, AT, AU, BE, BG, BH, BR, CN, CO, CR, CY, CZ, DE, EC, EE, EG, ES, FI, FR, GB, GT, HK, HN, HU, ID, IE, IL, IN, IQ, IR, IT, JO, KW, LB, LY, MX, MY, NI, NL, NO, OM, PA, PE, PH, PK, PL, QA, SA, SE, SG, SV, SY, TW, VE, YE); Detrusitol Retard (DK, PT); Detrusitol SR (BG, CH, CZ, KP, MY, NO, SG, TH); Fluserin (UY); Sedatol SR (KP); Uretol SR (KP); Urginol (AR); Uridin (TW); Urositol (KP)

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Topamax® may be confused with Tegretol®, Tegretol®-XR, Toprol-XL®

Pronunciation(toe PYRE a mate)

U.S. Brand NamesTopamax®

Canadian Brand NamesApo-Topiramate; Co-Topiramate; Dom-Topiramate; Gen-Topiramate; Novo-Topiramate; PHL-Topiramate; PMS-Topiramate; ratio-Topiramate; Sandoz-Topiramate; Topamax®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsMonotherapy or adjunctive therapy for partial onset seizures and primary generalized tonic-clonic seizures; adjunctive treatment of seizures associated with Lennox-Gastaut syndrome; prophylaxis of migraine headache

Use: Unlabeled/InvestigationalInfantile spasms, neuropathic pain, cluster headache

Dosing: Adults**Note:** Do not abruptly discontinue therapy; taper dosage gradually to prevent rebound effects. (In clinical trials, adult doses were withdrawn by decreasing in weekly intervals of 50-100 mg/day gradually over 2-8 weeks for seizure treatment, and by decreasing in weekly intervals by 25-50 mg/day for migraine prophylaxis.)

Partial onset seizure (monotherapy) and primary generalized tonic-clonic seizure (monotherapy): Oral: Initial: 25 mg twice daily; may increase weekly by 50 mg/day up to 100 mg twice daily (week 4 dose); thereafter, may further increase weekly by 100 mg/day up to the recommended maximum of 200 mg twice daily.

Migraine prophylaxis: Oral: Initial: 25 mg/day (in the evening), titrated at weekly intervals in 25 mg increments, up to the recommended total daily dose of 100 mg/day given in 2 divided doses

Partial onset seizures (adjunctive therapy): Oral: Initial: 25-50 mg/day (given in 2 divided doses) for 1 week; increase at weekly intervals by 25-50 mg/day until response; usual maintenance dose: 100-200 mg twice daily. Doses >1600 mg/day have not been studied.

Primary generalized tonic-clonic seizures (adjunctive therapy): Oral: Use initial dose as listed above for partial onset seizures, but use slower initial titration rate; titrate upwards to recommended dose by the end of 8 weeks; usual maintenance dose: 200 mg twice daily. Doses >1600 mg/day have not been studied.

Cluster headache (unlabeled use): Oral: Initial: 25 mg/day, titrated at weekly intervals in 25 mg increments, up to 200 mg/day

Neuropathic pain (unlabeled use): Oral: Initial: 25 mg/day, titrated at weekly intervals in 25-50 mg increments to target dose of 400 mg daily in 2 divided doses. Reported dosage range studied: 25-800 mg/day

Dosing: ElderlyMost older adults have creatinine clearances <70 mL/min; obtain a serum creatinine and calculate creatinine clearance prior to initiation of therapy. An initial dose of 25 mg/day may be recommended, followed by incremental increases of 25 mg at weekly intervals until an effective dose is reached; refer to adult dosing for titration schedule.

Dosing: Pediatric**Note:** Do not abruptly discontinue therapy; taper dosage gradually to prevent rebound effects.
*Monotherapy:***Partial onset seizure and primary generalized tonic-clonic seizure:** Children ≥10 years: Oral: Refer to adult dosing.

Adjunctive therapy:

Partial onset seizure or seizure associated with Lennox-Gastaut syndrome: Children 2-16 years: Oral: Initial dose titration should begin at 25 mg (or less, based on a range of 1-3 mg/kg/day) nightly for the first week; dosage may be increased in increments of 1-3 mg/kg/day (administered in 2 divided doses) at 1- or 2-week intervals to a total daily dose of 5-9 mg/kg/day

Adolescents ≥17 years: Refer to adult dosing.

Primary generalized tonic-clonic seizure: Children 2-16 years: Oral: Use initial dose listed above, but use slower initial titration rate; titrate to recommended maintenance dose by the end of 8 weeks

Adolescents ≥17 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <70 mL/minute: Administer 50% dose and titrate more slowly.

Hemodialysis: Supplemental dose may be needed during hemodialysis

Dialyzable: ~30%

Dosing: Hepatic ImpairmentClearance may be reduced.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered without regard to meals

Capsule sprinkles: May be swallowed whole or opened to sprinkle the contents on soft food (drug/food mixture should not be chewed).

Tablet: Because of bitter taste, tablets should not be broken.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsHypersensitivity to topiramate or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Cognitive dysfunction, psychiatric disturbances (mood disorders), and sedation (somnolence or fatigue) may occur with use; incidence may be related to rapid titration and higher doses. May also cause paresthesia, dizziness, and ataxia.

- Glaucoma: Has been associated with acute myopia and secondary angle-closure glaucoma in adults and children, typically within 1 month of initiation; discontinue in patients with acute onset of decreased visual acuity or ocular pain.

- Hyperthermia: May be associated (rarely) with severe oligohydrosis and hyperthermia, most frequently in children; use caution and monitor closely during strenuous exercise, during exposure to high environmental temperature, or in patients receiving drugs with anticholinergic activity.

- Metabolic acidosis (hyperchloremic, nonanion gap): May decrease serum bicarbonate concentrations, due to inhibition of carbonic anhydrase and increased renal bicarbonate loss. Decreases in serum bicarbonate are relatively common (7% to 67%) but usually mild to moderate (average decrease of 4 mEq/L at dose of 400 mg/day in adults and 6 mg/kg/day in children). Treatment-emergent metabolic acidosis is less common; however, risk may be increased in patients with a predisposing condition (renal, respiratory and/or hepatic impairment), ketogenic diet, or concurrent treatment with other drugs which may cause acidosis. Metabolic acidosis may occur at dosages as low as 50 mg/day. Serum bicarbonate should be monitored, as well as potential complications of chronic acidosis (nephrolithiasis, osteomalacia, and reduced growth rates in children). Dose reduction or discontinuation (by tapering dose) should be considered in patients with persistent or severe metabolic acidosis. If treatment is continued, alkali supplementation should be considered.

- Renal calculus: Topiramate exhibits carbonic anhydrase properties and the risk of kidney stones is about 2-4 times that of the untreated population. Kidney stones have been reported in children and adults. The risk of stones may be reduced by increasing fluid intake.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment may be required.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment may be required.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

- Valproate: Hyperammonemia with or without encephalopathy may occur and has been documented in patients who have tolerated each drug alone. Risk may be increased in patients with inborn errors of metabolism or decreased hepatic mitochondrial activity. Monitor for lethargy, vomiting, or unexplained changes in mental status.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age for adjunctive treatment of seizures and <10 years of age for monotherapy treatment of seizures. Safety and efficacy have not been established in children for migraine prophylaxis.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal. Doses were also gradually withdrawn in migraine prophylaxis studies (decreased in weekly intervals by 25-50 mg/day).

Geriatric ConsiderationsThis drug may not be a drug of choice in the elderly until all other therapies for seizures have been exhausted. Follow the recommended titration schedule and adjust time intervals to meet patient's needs. Since most elderly will have a Cl_{cr} <70 mL/minute, it is important to either measure or estimate by calculation the Cl_{cr} prior to initiating therapy.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTopiramate was found to be teratogenic in animal studies; however, there is limited information in pregnant women; use only if benefit to the mother outweighs the risk to the fetus. Based on limited data, topiramate was found to cross the placenta. Postmarketing experience includes reports of hypospadias following *in vitro* exposure to topiramate.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsBased on limited data, topiramate was found in breast milk; low concentrations were detected in nursing infants.

Adverse ReactionsAdverse events are reported for placebo-controlled trials of adjunctive therapy in adult and pediatric patients. Unless otherwise noted, the percentages refer to incidence in epilepsy trials. Note: A wide range of dosages were studied; incidence of adverse events was frequently lower in the pediatric population studied.

>10%:

Central nervous system: Dizziness (4% to 32%), ataxia (6% to 16%), somnolence (15% to 29%), psychomotor slowing (3% to 21%), nervousness (9% to 19%), memory difficulties (2% to 14%), speech problems (2% to 13%), fatigue (9% to 30%), difficulty concentrating (5% to 14%), depression (9% to 13%), confusion (4% to 14%)

Endocrine & metabolic: Serum bicarbonate decreased (dose-related: 7% to 67%; marked reductions [to <17 mEq/L] 1% to 11%)

Gastrointestinal: Nausea (6% to 12%; migraine trial: 14%), weight loss (8% to 13%), anorexia (4% to 24%)

Neuromuscular & skeletal: Paresthesia (1% to 19%; migraine trial: 35% to 51%)

Ocular: Nystagmus (10% to 11%), abnormal vision (<1% to 13%)

Respiratory: Upper respiratory infection (migraine trial: 12% to 13%)

Miscellaneous: Injury (6% to 14%)

1% to 10%:

Cardiovascular: Chest pain (2% to 4%), edema (1% to 2%), bradycardia (1%), pallor (up to 1%), hypertension (1% to 2%)

Central nervous system: Abnormal coordination (4%), hypoesthesia (1% to 2%; migraine trial: 8%), convulsions (1%), depersonalization (1% to 2%), apathy (1% to 3%), cognitive problems (3%), emotional lability (3%), agitation (3%), aggressive reactions (2% to 9%), tremor (3% to 9%), stupor (1% to 2%), mood problems (4% to 9%), anxiety (2% to 10%), insomnia (4% to 8%), fever (migraine trial: 1% to 2%), vertigo (1% to 2%), neurosis (1%)

Dermatologic: Pruritus (migraine trial: 2% to 4%), skin disorder (1% to 3%), alopecia (2%), dermatitis (up to 2%), hypertrichosis (up to 2%), rash erythematous (up to 2%), eczema (up to 1%), seborrhea (up to 1%), skin discoloration (up to 1%)

Endocrine & metabolic: Hot flashes (1% to 2%); metabolic acidosis (hyperchloremia, nonanion gap), dehydration, breast pain (up to 4%), menstrual irregularities (1% to 2%), hypoglycemia (1%), libido decreased (<1% to 2%)

Gastrointestinal: Dyspepsia (2% to 7%), abdominal pain (5% to 7%), constipation (3% to 5%), xerostomia (2% to 4%), fecal incontinence (1%), gingivitis (1%), diarrhea (2%; migraine trial: 11%), vomiting (1% to 3%), gastroenteritis (1% to 3%), GI disorder (1%), dysgeusia (2% to 4%; migraine trial: 12% to 15%), appetite increased (1%), dysphagia (1%), flatulence (1%), GERD (1%), glossitis (1%), gum hyperplasia (1%), weight gain (1%)

Genitourinary: Impotence, dysuria/incontinence (<1% to 4%), prostatic disorder (2%), UTI (2% to 3%), premature ejaculation (migraine trial: 3%), cystitis (2%)

Hematologic: Leukopenia (1% to 2%), purpura (8%), hematoma (1%), prothrombin time increased (1%), thrombocytopenia (1%)

Neuromuscular & skeletal: Myalgia (2%), weakness (3% to 6%), back pain (1% to 5%), leg pain (2% to 4%), rigors (1%), hypertonia, arthralgia (1% to 7%), gait abnormal (2% to 8%), involuntary muscle contractions (2%; migraine trial: 4%), skeletal pain (1%), hyperkinesia (up to 5%), hyporeflexia (up to 2%)

Ocular: Conjunctivitis (1%), diplopia (2% to 10%), myopia (up to 1%)

Otic: Hearing decreased (1% to 2%), tinnitus (1% to 2%), otitis media (migraine trial: 1% to 2%)

Renal: Nephrolithiasis, renal calculus (1% to 2%), hematuria (<1% to 2%)

Respiratory: Pharyngitis (3% to 6%), sinusitis (4% to 6%; migraine trial: 8% to 10%), epistaxis (1% to 4%), rhinitis (4% to 7%), dyspnea (1% to 2%), pneumonia (5%), cough (migraine trial: 2% to 3%), bronchitis (migraine trial: 3%)

Miscellaneous: Flu-like syndrome (3% to 7%), allergy (2% to 3%), body odor (up to 1%), viral infection (migraine trial: 3% to 4%), infection (<1% to 2%), diaphoresis (≤1%), thirst (2%)

<1% (Limited to important or life-threatening): Anemia, angina, apraxia, AV block, bone marrow depression, deep vein thrombosis, dehydration, delirium, diabetes mellitus, dyskinesia, electrolyte imbalance, encephalopathy (with valproate therapy), eosinophilia, euphoria, granulocytopenia, hypokalemia, hypotension, liver enzymes increased, lymphadenopathy, lymphopenia, manic reaction, neuropathy, pancytopenia, paranoid reaction, photosensitivity, psychosis, pulmonary embolism, suicidal behavior, syncope, tongue edema

Postmarketing and/or case reports: Accommodation abnormality, erythema multiforme, eye pain, hepatic failure, hepatitis, hyperammonemia (with valproate therapy), hyperthermia (severe), migraine aggravated, oligohydrosis, pancreatitis, pemphigus, rash, renal tubular acidosis, Stevens-Johnson syndrome, syndrome of acute myopia/secondary angle-closure glaucoma, toxic epidermal necrolysis

Metabolism/Transport Effects**Inhibits** CYP2C19 (weak); **Induces** CYP3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Topiramate. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Topiramate may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: Topiramate may decrease the metabolism of Phenytoin. Phenytoin may increase the metabolism of Topiramate. *Risk C: Monitor therapy*

Valproic Acid: Topiramate may enhance the hepatotoxic effect of Valproic Acid. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Ketogenic diet may increase the possibility of acidosis and/or kidney stones.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased).

Monitoring ParametersSeizure frequency, hydration status; electrolytes (recommended monitoring includes serum bicarbonate at baseline and periodically during treatment), serum creatinine; monitor for symptoms of acute acidosis and complications of long-term acidosis (nephrolithiasis, osteomalacia, and reduced growth rates in children); ammonia level in patients with unexplained lethargy, vomiting, or mental status changes; intraocular pressure, symptoms of secondary angle closure glaucoma

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness (seizure activity, force, type, duration), laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. May cause weight loss; monitor weight periodically. Assess knowledge/teach patient appropriate use, seizure safety precautions, interventions to reduce side effects, and adverse symptoms to report..

Monitoring: Lab TestsRecommended monitoring includes serum bicarbonate (baseline and periodically during treatment) and serum creatinine. Ammonia level in patients with unexplained lethargy, vomiting, or mental status changes.

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake; possibly to prevent the development of kidney stones and dehydration. You may be at risk for decreased sweating and increased body temperature, especially in hot weather. You may experience drowsiness, dizziness, disturbed concentration, memory changes, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or mouth sores, nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Wear identification of epileptic status and medications. Report behavioral or CNS changes, suicidal ideation, or depression; skin rash; muscle cramping, numbness in extremities, weakness, tremors, changes in gait; chest pain, irregular heartbeat, or palpitations; hearing loss; cough or respiratory difficulty; or worsening of seizure activity or loss of seizure control. Seek immediate medical evaluation if you experience sudden vision changes, periorbital pain, flank pain, or blood in urine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, sprinkle:

Topamax®: 15 mg, 25 mg

Tablet:

Topamax®: 25 mg, 50 mg, 100 mg, 200 mg

Generic AvailableNo

ManufacturerOrtho-McNeil Pharmaceutical, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Topamax)

25 mg (60): $148.51

50 mg (60): $278.81

100 mg (60): $395.39

200 mg (60): $457.08

Mechanism of ActionAnticonvulsant activity may be due to a combination of potential mechanisms: Blocks neuronal voltage-dependent sodium channels, enhances GABA(A) activity, antagonizes AMPA/kainate glutamate receptors, and weakly inhibits carbonic anhydrase.

Pharmacodynamics/Kinetics

Absorption: Good, rapid; unaffected by food

Protein binding: 15% to 41% (inversely related to plasma concentrations)

Metabolism: Hepatic via P450 enzymes

Bioavailability: 80%

Half-life elimination: Mean: Adults: Normal renal function: 21 hours; shorter in pediatric patients; clearance is 50% higher in pediatric patients; Elderly: ~24 hours

Time to peak, serum: ~1-4 hours

Excretion: Urine (~70% to 80% as unchanged drug)

Dialyzable: ~30%

Related Information

- Anticonvulsants by Seizure Type

Pharmacotherapy Pearls May be associated with weight loss in some patients

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Gingivitis, dysphagia, glossitis, gum hyperplasia, and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health Comment Large double-blind studies have failed to differentiate this drug from placebo when used for bipolar disorder.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Hycamtin® may be confused with Hycomine®, Mycamine®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(toe poe TEE kan)

U.S. Brand NamesHycamtin®

Canadian Brand NamesHycamtin®

Pharmacologic CategoryAntineoplastic Agent, Camptothecin; Antineoplastic Agent, Natural Source (Plant) Derivative

Use: Labeled IndicationsTreatment of ovarian cancer and small cell lung cancer; cervical cancer (in combination with cisplatin)

Use: Unlabeled/InvestigationalInvestigational: Treatment of nonsmall cell lung cancer, myelodysplastic syndrome, sarcoma (pediatrics), neuroblastoma (pediatrics), refractory solid tumors (pediatrics)

Dosing: AdultsRefer to individual protocols: **Note:** Baseline neutrophil count should be >1500/mm^3; retreatment neutrophil count should be >1000/mm^3; baseline and retreatment platelet count should be >100,000/mm^3; (also, for oral topotecan, retreatment hemoglobin should be ≥9 g/dL):

Small cell lung cancer:

IVPB: 1.5 mg/m^2/day for 5 days; repeated every 21 days

Oral: 2.3 mg/m^2/day for 5 days; repeated every 21 days (round dose to the nearest 0.25 mg); if patient vomits after dose is administered, do not give a replacement dose.

Metastatic ovarian cancer:

IVPB: 1.5 mg/m^2/day for 5 days; repeated every 21 days

I.V. continuous infusion (unlabeled dose) 0.2-0.7 mg/m^2/day for 7-21 days

Cervical cancer: IVPB: 0.75 mg/m^2/day for 3 days (followed by cisplatin 50 mg/m^2 on day 1 only, [with hydration]); repeated every 21 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

The FDA-approved labeling recommends the following dosage adjustment:

I.V.:

Cl_{cr} 20-39 mL/minute: Reduce to 0.75 mg/m^2/dose

Cl_{cr} <20 mL/minute: Insufficient data available for dosing recommendation

Note: For topotecan in combination with cisplatin for cervical cancer, do not initiate treatment in patients with serum creatinine >1.5 mg/dL; consider discontinuing treatment in patients with serum creatinine >1.5 mg/dL in subsequent cycles.

Oral:

Cl_{cr} 30-49 mL/minute: Reduce dose to 1.8 mg/m^2/day

Cl_{cr} <30 mL/minute: Insufficient data available for dosing recommendation

The following guidelines have been used by some clinicians:

Aronoff, 2007: *I.V.:*

Children:

Cl_{cr} 30-50 mL/minute: Administer 75% of dose

Cl_{cr} 10-29 mL/minute: Administer 50% of dose or reduce by 0.75 mg/m^2/dose

Cl_{cr} <10 mL/minute: Administer 25% of dose

Hemodialysis: 0.75 mg/m^2

Continuous renal replacement therapy (CRRT): Administer 50% of dose or reduce by 0.75 mg/m^2/dose

Adults:

Cl_{cr} >50 mL/minute: Administer 75% of dose

Cl_{cr} 10-50 mL/minute: Administer 50% of dose

Cl_{cr} <10 mL/minute: Administer 25% of dose

Hemodialysis: Avoid use

Continuous ambulatory peritoneal dialysis (CAPD): Avoid use

Continuous renal replacement therapy (CRRT): 0.75 mg/m^2

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 80% of dose

Cl_{cr} 31-45 mL/minute: Administer 75% of dose

Cl_{cr} <30 mL/minute: Administer 70% of dose

Dosing: Hepatic ImpairmentThe FDA-approved labeling recommends the following:

I.V.: Bilirubin 1.5-10 mg/dL: No adjustment necessary.

Oral: Bilirubin >1.5 mg/dL: No adjustment necessary.

Dosing: Adjustment for Toxicity

I.V.:

Ovarian and small cell lung cancer: Dosage adjustment for hematological effects: Severe neutropenia or platelet count <25,000/mm^3: Reduce dose to 1.25 mg/m^2/day for subsequent cycles (may consider G-CSF support [beginning on day 6] prior to instituting dose reduction for neutropenia)

Cervical cancer: Severe febrile neutropenia (ANC <1000/mm^3 with temperature of 38°C) or platelet count <10,000/mm^3: Reduce topotecan to 0.6 mg/m^2/day for subsequent cycles (may consider C-CSF support [beginning on day 4] prior to instituting dose reduction for neutropenic fever.

For neutropenic fever despite G-CSF use, reduce dose to 0.45 mg/m^2/day for subsequent cycles). **Note:** Cisplatin may also require dose adjustment.

Oral:

Small cell lung cancer: Severe neutropenia (neutrophils <500/mm^3 associated with fever or infection or lasting >7 days) or prolonged neutropenia (neutrophils ≥500/mm^3 to ≤1000/mm^3 lasting beyond day 21) or platelets <25,000/mm^3 or grades 3/4 diarrhea: Reduce dose to 1.9 mg/m^2/day for subsequent cycles (may consider same dosage reduction for grade 2 diarrhea if clinically indicated).

Dosing: Combination Regimens

Cervical cancer: Topotecan-Cisplatin

Leukemia, acute lymphocytic: TVTG

Leukemia, acute myeloid: TVTG

Lung cancer, nonsmall cell: Topotecan (Oral Regimen)

Lung cancer, small cell:

Topotecan (Oral Regimen)

Topotecan (Oral)-Cisplatin

Topotecan (Weekly)

Ovarian cancer:

Topotecan (Oral Regimen)

Topotecan (Weekly)

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.Administer IVPB over 30 minutes or by 24-hour continuous infusion. For combination chemotherapy with cisplatin, administer pretreatment hydration.

Administration: I.V. DetailpH: 2.5-3.5

Administration: OralAdminister with or without food. Swallow whole; do not crush, chew, or divide capsule. If vomiting occurs after dose, do not take replacement dose.

Dietary ConsiderationsMay be taken with or without food.

Storage

I.V.: Store intact vials of lyophilized powder for injection at room temperature of 20°C to 25°C (68°F to 77°F); protect from light. Reconstituted solution is stable for up to 28 days at room temperature of 20°C to 25°C (68°F to 77°F). When further diluted in 50-100 mL D_5W or NS, solution is stable for 24 hours at room temperature or up to 7 days under refrigeration.

Oral: Store at 15°C to 30°C (59°F to 86°F). Protect from light

ReconstitutionReconstitute vials with 4 mL SWFI. May be further diluted in 50-100 mL D_5W or NS for infusion.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Carboplatin, cimetidine, cisplatin, cyclophosphamide, doxorubicin, etoposide, gemcitabine, granisetron, ifosfamide, methylprednisolone sodium succinate, metoclopramide, ondansetron, paclitaxel, prochlorperazine edisylate, vincristine. **Incompatible:** Dexamethasone sodium phosphate, fluorouracil, mitomycin. **Variable (consult detailed reference):** Ticarcillin/clavulanate.

ContraindicationsHypersensitivity to topotecan or any component of the formulation; severe bone marrow depression; pregnancy; breast-feeding

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent - use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: The dose-limiting toxicity is bone marrow suppression (primarily neutropenia; may also cause thrombocytopenia and anemia); monitor bone marrow function. Neutropenia is not cumulative overtime. **[U.S. Boxed Warning]: Should only administer to patients with adequate bone marrow reserves, baseline neutrophils at least 1500 cells/mm^3** and platelet counts at least 100,000/mm^3. In a clinical study comparing I.V. to oral topotecan, G-CSF support was administered in a higher percentage of patients receiving oral topotecan.
- Diarrhea: Diarrhea has been reported with oral topotecan; may be severe; educate patients on proper management of diarrhea. The incidence of diarrhea may be higher in the elderly.
- Neutropenic colitis: Topotecan-induced neutropenia may lead to neutropenic colitis; should be considered in patients presenting with neutropenia, fever, and abdominal pain.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; may require dose adjustment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies found reduced fetal body weight, eye, brain, skull, and vertebrae malformations. May cause fetal harm in pregnant women. Use during pregnancy is contraindicated.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsBreast-feeding should be discontinued in women who are receiving topotecan.

Adverse Reactions

>10%:

Central nervous system: Fatigue (11% to 29%), fever (5% to 28%), pain (23%), headache (18%)

Dermatologic: Alopecia (10% to 49%), rash (16%)

Gastrointestinal: Nausea (27% to 64%), vomiting (19% to 45%), diarrhea (14% to 32%; Oral: grade 3: 4%; grade 4: ≤1%; onset: 9 days), constipation (29%), abdominal pain (22%), anorexia (7% to 19%), stomatitis (18%)

Hematologic: Neutropenia (83% to 97%; grade 4: 32% to 80%; nadir 8-11 days; duration: 7 days; recovery <21 days), leukopenia (86% to 97%; grade 4: 15% to 32%), anemia (89% to 98%; grade 4: 7% to 10%), thrombocytopenia (69% to 81%; grade 4: 6% to 29%; duration: 3 days), neutropenic fever/sepsis (2% to 28%)

Neuromuscular & skeletal: Weakness (3% to 25%)

Respiratory: Dyspnea (22%), cough (15%)

1% to 10%:

Hepatic: Transient increases in liver enzymes (8%)

Neuromuscular & skeletal: Paresthesia (7%)

Miscellaneous: Sepsis (grades 3/4: 5%)

<1%, postmarketing, and/or case reports: Abdominal pain, allergic reactions, anaphylactoid reactions, angioedema, bleeding (severe, associated with thrombocytopenia), dermatitis (severe), injection site reactions (mild erythema, bruising), neutropenic colitis, pancytopenia, pruritus (severe)

Oncology: VesicantI.V.: No; inadvertent extravasation may result in mild erythema and bruising
Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

BCRP/ABCG2 Inhibitors: May increase the serum concentration of Topotecan. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Filgrastim: May enhance the adverse/toxic effect of Topotecan. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inhibitors: May increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Platinum Derivatives: May enhance the adverse/toxic effect of Topotecan. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).
Test InteractionsNone known
Monitoring ParametersCBC with differential and platelet count, renal function tests, bilirubin
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking. I.V.: See administration specifics. Evaluate results of laboratory tests, therapeutic effectiveness, and adverse reactions prior to each infusion and on a regular basis with oral formulation (eg, signs of myelosuppression, renal function [I & O, edema], gastrointestinal disturbance [nausea, vomiting, diarrhea, pain], dyspnea). Teach patient appropriate use (oral), possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelet count, renal function tests, bilirubin
Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. If this drug is administered by intravenous infusion, report immediately any burning, pain, redness, or swelling at infusion site; sudden chest pain; difficulty breathing or swallowing; or chills. Oral form may be taken with or without food. Swallow whole; do not crush, chew, or divide capsule. If vomiting occurs after dose, do not take replacement dose; take next dose at scheduled time. Maintain adequate hydration (3-4 L/day of fluids) unless instructed to restrict fluid intake during therapy. Maintain good oral hygiene (use soft toothbrush or cotton applicators several times a day and rinse mouth frequently). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or hair loss (will regrow after treatment is completed). Report unresolved diarrhea, nausea, vomiting, or unusual abdominal pain; alterations in urinary pattern (increased or decreased); opportunistic infection (fever, chills, unusual bruising or bleeding, fatigue, purulent vaginal discharge, unhealed mouth sores); chest pain; respiratory difficulty; unexplained weakness or fatigue; or other persistent effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant or cause a pregnancy (males) while taking this medication. Consult prescriber for appropriate contraceptive measures (may cause severe fetal defects). Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Hycamtin®: 0.25 mg, 1 mg

Injection, powder for reconstitution:

Hycamtin®: 4 mg

Generic AvailableNo
Mechanism of ActionBinds to topoisomerase I and stabilizes the cleavable complex so that religation of the cleaved DNA strand cannot occur. This results in the accumulation of cleavable complexes and single-strand DNA breaks. Topotecan acts in S phase of the cell cycle.

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid

Distribution: V_{dss} of the lactone is high (mean: 87.3 L/mm^2; range: 25.6-186 L/mm^2), suggesting wide distribution and/or tissue sequestering

Protein binding: ~35%

Metabolism: Undergoes a rapid, pH-dependent hydrolysis of the lactone ring to yield a relatively inactive hydroxy acid in plasma; metabolized in the liver to N-demethylated metabolite

Bioavailability: Oral: ~40%

Half-life elimination: I.V.: 2-3 hours; renal impairment: 5 hours; Oral: 3-6 hours

Time to peak, plasma: Oral 1-2 hours; delayed with high-fat meal (1.5-4 hours)

Excretion:

I.V.: Urine (51%; 3% as N-desmethyl topotecan); feces (18%; 2% as N-desmethyl topotecan)

Oral: Urine (20%; 2% as N-desmethyl topotecan); feces (33%; <2% as N-desmethyl topotecan)

Related Information

- Safe Handling of Hazardous Drugs

Toremifene

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(tore EM i feen)

U.S. Brand NamesFareston®

Canadian Brand NamesFareston®

Pharmacologic CategoryAntineoplastic Agent, Estrogen Receptor Antagonist; Selective Estrogen Receptor Modulator (SERM)

Use: Labeled IndicationsTreatment of postmenopausal metastatic breast cancer (estrogen receptor positive or estrogen receptor status unknown)

Dosing: Adults **Metastatic breast carcinoma:** Oral: 60 mg once daily, generally continued until disease progression is observed

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentToremifene is extensively metabolized in the liver and dosage adjustments may be indicated in patients with liver disease; however, no specific guidelines have been developed.

Administration: OralAdminister as a single daily dose.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from heat and light.

ContraindicationsHypersensitivity to toremifene or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Leukopenia and thrombocytopenia have been reported rarely.
- Gynecologic effects: Endometrial hyperplasia has been reported; endometrial cancer has been reported, although the role of toremifene in endometrial cancer development has not been established.
- Hypercalcemia: May occur during the first weeks of treatment in breast cancer patients with bone metastases. Institute appropriate measures if hypercalcemia occurs; discontinue treatment if severe.
- Tumor flare: May occur during the first weeks of treatment in breast cancer patients with bone metastases. Tumor flare is a syndrome of diffuse musculoskeletal pain and erythema with increased size of tumor lesions which later regress. It is often accompanied by hypercalcemia and does not imply treatment failure or represent tumor progression.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Thromboembolic disease: Avoid use in patients with thromboembolic disease.

Concurrent drug therapy issues:

- Drugs that decrease renal calcium excretion: Use with caution drugs that decrease renal calcium excretion (eg, thiazide diuretics); they may increase the risk of hypercalcemia in patients receiving toremifene.

Geriatric ConsiderationsNo specific information concerning elderly patients.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated embryotoxicity and fetal adverse effects. There are no adequate and well-controlled studies in pregnant women. May cause fetal harm if administered during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Endocrine & metabolic: Hot flashes (35%)

Gastrointestinal: Nausea (14%)

Genitourinary: Vaginal discharge (13%)

Hepatic: Alkaline phosphatase increased (8% to 19%), AST increased (5% to 19%)

Miscellaneous: Diaphoresis (20%)

1% to 10%:

Cardiovascular: Edema (5%), arrhythmia (≤2%), CVA/TIA (≤2%), thrombosis (≤2%), cardiac failure (≤1%), MI (≤1%)

Central nervous system: Dizziness (9%)

Endocrine & metabolic: Hypercalcemia (≤3%)

Gastrointestinal: Vomiting (4%)

Genitourinary: Vaginal bleeding (2%)

Hepatic: Bilirubin increased (1% to 2%)

Local: Thrombophlebitis (≤2%)

Ocular: Cataracts (≤10%), xerophthalmia (≤9%), visual field abnormal (≤4%), corneal keratopathy (≤2%), glaucoma (≤2%), vision abnormal/diplopia (≤2%)

Respiratory: Pulmonary embolism (≤2%)

<1%, postmarketing, and/or case reports: Alopecia, angina, anorexia, arthritis, ataxia, constipation, corneal opacity (reversible), corneal verticulata, deep vein thrombosis, depression, dermatitis, dyspnea, endometrial cancer, endometrial hyperplasia, fatigue, hepatitis (toxic), incoordination, ischemic attack, jaundice, lethargy, leukopenia, paresis, pruritus, retinopathy, rigors, skin discoloration, thrombocytopenia, thrombophlebitis, tremor, tumor flare, vaginal dryness, vertigo, weakness

Oncology: Emetic PotentialModerate (10% to 30%)
Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 3A4 (major)
Drug Interactions

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease toremifene levels).
Monitoring ParametersObtain periodic complete blood counts, calcium levels, and liver function tests. Closely monitor patients with bone metastases for hypercalcemia during the first few weeks of treatment. Leukopenia and thrombocytopenia have been reported rarely; monitor leukocyte and platelet counts during treatment.
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (drugs that decrease renal calcium excretion [eg, thiazide diuretics] may increase the risk of hypercalcemia, use with warfarin increases anticoagulant effect). Assess results of laboratory tests on a regular basis throughout therapy. Evaluate therapeutic effectiveness and adverse reactions regularly (eg, thromboembolism, MI, edema, hypercalcemia, endometriosis, nausea, vomiting, vision changes). Teach patient proper use, possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsObtain periodic complete blood counts, calcium levels, and liver function tests. Closely monitor patients with bone metastases for hypercalcemia during the first few weeks of treatment. Leukopenia and thrombocytopenia have been reported rarely; monitor leukocyte and platelet counts during treatment.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, without regard to food. You may experience an initial “flare” of this disease (eg, increased bone pain and hot flashes), which will subside with continued use. May cause nausea, vomiting, or loss of appetite (frequent mouth care, small, frequent meals, chewing gum, or sucking lozenges may help); dizziness (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); or loss of hair (reversible). Report vomiting that occurs immediately after taking medication; chest pain, palpitations, or swollen extremities; vaginal bleeding, hot flashes, or excessive perspiration; chest pain, unusual coughing, or respiratory difficulty; or any vision changes or dry eyes. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Fareston®: 60 mg

Generic AvailableNo
ManufacturerGTx, Inc
Pricing: U.S. (www.drugstore.com)

Tablets (Fareston)

60 mg (30): $139.28

Mechanism of ActionNonsteroidal, triphenylethylene derivative with potent antiestrogenic properties (also has estrogenic effects). Competitively binds to estrogen receptors on tumors and other tissue targets, producing a nuclear complex that decreases DNA synthesis and inhibits estrogen effects. Competes with estrogen for binding sites in breast and other tissues; cells accumulate in the G_0 and G_1 phases; therefore, toremifene is cytostatic rather than cytocidal.
Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: 580 L (range: 457-958 L)

Protein binding, plasma: >99.5%, primarily to albumin

Metabolism: Extensively hepatic, principally by CYP3A4 to N-demethyltoremifene, which is also antiestrogenic but with weak *in vivo* antitumor potency

Half-life elimination: ~5 days

Time to peak, serum: ~3 hours (range: 2-6 hours)

Excretion: Primarily feces; urine (10%) during a 1-week period

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, anxiety, irritability, insomnia, and depression are common

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsFC1157a; Toremifene Citrate

Torsemide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Torsemide may be confused with furosemide

Demadex® may be confused with Denorex®

Pronunciation(TORE se mide)

U.S. Brand NamesDemadex®

Pharmacologic CategoryDiuretic, Loop

Use: Labeled IndicationsManagement of edema associated with congestive heart failure and hepatic or renal disease; used alone or in combination with antihypertensives in treatment of hypertension; I.V. form is indicated when rapid onset is desired

Dosing: Adults

Note: The oral form may be given regardless of meal times. Patients may be switched from the I.V. form to the oral and vice-versa with no change in dose.

Congestive heart failure: Oral, I.V.: 10-20 mg once daily; may increase gradually for chronic treatment by doubling dose until the diuretic response is apparent (for acute treatment. I.V. dose may be repeated every 2 hours with double the dose as needed). **Note:** ACC/AHA 2005 guidelines for chronic heart failure recommend a maximum daily oral dose of 200 mg; maximum single I.V. dose 100-200 mg

Continuous I.V. infusion: 20 mg I.V. load then 5-20 mg/hour

Chronic renal failure: Oral, I.V.: 20 mg once daily; increase as above.

Hepatic cirrhosis: Oral, I.V.: 5-10 mg once daily with an aldosterone antagonist or a potassium-sparing diuretic; increase as above.

Hypertension: Oral, I.V.: 2.5-5 mg once daily; increase to 10 mg after 4-6 weeks if an adequate hypotensive response is not apparent. If still not effective, an additional antihypertensive agent may be added.

Dosing: ElderlyUsual starting dose should be 5 mg; refer to adult dosing.

Administration: I.V.I.V. injections should be given over ≥2 minutes.

Administration: I.V. DetailOtotoxicity has occurred with too rapid of injection.

pH: >8.3

StorageIf torsemide is to be administered via continuous infusion, stability has been demonstrated through 24 hours at room temperature in plastic containers for the following fluids and concentrations:

200 mg torsemide (10 mg/mL) added to 250 mL D_5W, 250 mL NS or 500 mL 0.45% sodium chloride.

50 mg torsemide (10 mg/mL) added to 500 mL D_5W, 250 mL NS or 500 mL 0.45% sodium chloride.

CompatibilityStable in D_5W, NS, $^1/_2$NS.

Y-site administration: Compatible: Milrinone.

ContraindicationsHypersensitivity to torsemide, any component of the formulation, or any sulfonylureas; anuria

Allergy Considerations

- Loop Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fluid/electrolyte loss: Loop diuretics are potent diuretics; excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.

- Nephrotoxicity: Monitor fluid status and renal function in an attempt to prevent oliguria, azotemia, and reversible increases in BUN and creatinine; close medical supervision of aggressive diuresis required.

- Ototoxicity: Rapid I.V. administration (associated with other loop diuretics), renal impairment, excessive doses, and concurrent use of other ototoxins is associated with ototoxicity; has been seen with oral torsemide.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Cirrhosis: In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

Concurrent drug therapy issues:

- Antihypertensives: Coadministration of antihypertensives may increase the risk of hypotension.

Geriatric ConsiderationsLoop diuretics are potent diuretics, excess amounts can lead to profound diuresis with fluid and electrolyte loss. Close medical supervision and dose evaluation is required, particularly in elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsA decrease in fetal weight, an increase in fetal resorption, and delayed fetal ossification has occurred in animal studies.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Edema (1.1%), ECG abnormality (2%), chest pain (1.2%)

Central nervous system: Headache (7.3%), dizziness (3.2%), insomnia (1.2%), nervousness (1%)

Endocrine & metabolic: Hyperglycemia, hyperuricemia, hypokalemia

Gastrointestinal: Diarrhea (2%), constipation (1.8%), nausea (1.8%), dyspepsia (1.6%), sore throat (1.6%)

Genitourinary: Excessive urination (6.7%)

Neuromuscular & skeletal: Weakness (2%), arthralgia (1.8%), myalgia (1.6%)

Respiratory: Rhinitis (2.8%), cough increase (2%)

<1% (Limited to important or life-threatening): Syncope, atrial fibrillation, hypotension, ventricular tachycardia, shunt thrombosis, hypovolemia, GI hemorrhage, rash, rectal bleeding, angioedema, hypernatremia

Metabolism/Transport Effects**Substrate** of CYP2C8 (minor), 2C9 (major); **Inhibits** CYP2C19 (weak)

Drug Interactions

ACE Inhibitors: Loop Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Loop Diuretics may enhance the adverse/toxic effect of Allopurinol. Loop Diuretics may increase the serum concentration of Allopurinol. Specifically, Loop Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoglycosides: Loop Diuretics may enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dofetilide: Loop Diuretics may enhance the QTc-prolonging effect of Dofetilide. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Loop Diuretics may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Phenytoin: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersRenal function, electrolytes, and fluid status (weight and I & O), blood pressure

Nursing: Physical Assessment/MonitoringAssess for allergy to sulfonylurea before beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products the patient may be taking (especially anything that may impact fluid balance or increase potential for ototoxicity or hypotension). For intravenous use, see Administration specifics. Assess results of laboratory tests (electrolytes), therapeutic effectiveness, and adverse response (eg, dehydration, electrolyte imbalance, postural hypotension) on a regular basis during therapy. Caution patients with diabetes about closely monitoring glucose levels (glucose tolerance may be decreased). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal function, electrolytes

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, with food or milk (to reduce GI distress), early in the day, or if twice daily, take last dose in late afternoon in order to avoid sleep disturbance and achieve maximum therapeutic effect. Include orange juice or bananas (or other potassium-rich foods) in daily diet. Do not take potassium supplements without consulting prescriber. Weigh yourself each day, at the same time, in the same clothes when beginning therapy, and weekly on long-term therapy; report unusual or unanticipated weight gain or loss. May cause postural hypotension (change position slowly when rising from sitting or lying); transient drowsiness, blurred vision, or dizziness (avoid driving or engaging in tasks that require alertness until response to drug is known); reduced tolerance to heat (avoid strenuous activity in hot weather or excessively hot showers); or constipation (increased exercise and increased dietary fiber, fruit, or fluids may help). Report unusual weight gain or loss (>5 lb/week), swelling of ankles and hands; persistent fatigue; unresolved constipation or diarrhea; weakness, fatigue, or dizziness; vomiting; cramps; change in hearing; or chest pain or palpitations. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution:

Demadex®: 10 mg/mL (2 mL [DSC], 5 mL [DSC])

Tablet: 5 mg, 10 mg, 20 mg, 100 mg

Demadex®: 5 mg, 10 mg, 20 mg, 100 mg [scored]

Generic AvailableYes: Tablet

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Demadex)

5 mg (30): $41.39

10 mg (30): $43.69

20 mg (30): $49.44

100 mg (30): $160.98

Tablets (Torsemide)

5 mg (30): $18.99

10 mg (30): $19.99

20 mg (30): $22.99

100 mg (30): $75.98

Mechanism of ActionInhibits reabsorption of sodium and chloride in the ascending loop of Henle and distal renal tubule, interfering with the chloride-binding cotransport system, thus causing increased excretion of water, sodium, chloride, magnesium, and calcium; does not alter GFR, renal plasma flow, or acid-base balance

Pharmacodynamics/Kinetics

Onset of action: Diuresis: 30-60 minutes

Peak effect: 1-4 hours

Duration: ~6 hours

Absorption: Oral: Rapid

Protein binding, plasma: ~97% to 99%

Metabolism: Hepatic (80%) via CYP

Bioavailability: 80% to 90%

Half-life elimination: 2-4; Cirrhosis: 7-8 hours

Excretion: Urine (20% as unchanged drug)

Related Information

- Sulfonamide Derivatives

Pharmacotherapy Pearls10-20 mg torsemide is approximately equivalent to furosemide 40 mg or bumetanide 1 mg.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment May cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity, however, this is much more common and significant with the thiazide diuretics; monitor serum lithium levels; concurrent use with chloral hydrate may produce hot flashes and hypertension

Cardiovascular Considerations Torsemide may induce potent diuretic effects and, as with other potent diuretics, electrolytes and volume status needs to be closely monitored.

Anesthesia and Critical Care Concerns/Other Considerations If given the morning of surgery, it may render the patient volume depleted and blood pressure may be labile during general anesthesia. Torsemide may induce potent diuretic effects and, as with other potent diuretics, electrolytes and volume status needs to be closely monitored.

Dose equivalency (approximate): Bumetanide 1 mg = furosemide 40 mg = torsemide 20 mg

Tositumomab and Iodine I 131 Tositumomab

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(toe si TYOO mo mab & EYE oh dyne eye one THUR tee one toe si TYOO mo mab)

U.S. Brand NamesBexxar®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Radiopharmaceutical

Use: Labeled IndicationsTreatment of relapsed or refractory CD20 positive, low-grade, follicular, or transformed non-Hodgkin's lymphoma

Dosing: AdultsI.V.: Dosing consists of four components administered in 2 steps. Thyroid protective agents (SSKI, Lugol's solution or potassium iodide), acetaminophen and diphenhydramine should be given prior to or with treatment. Refer to Additional Information.

Step 1: Dosimetric step (Day 0):

Tositumomab 450 mg in NS 50 mL administered over 60 minutes

Iodine I 131 tositumomab (containing I-131 5.0 mCi and tositumomab 35mg) in NS 30 mL administered over 20 minutes

Note: Whole body dosimetry and biodistribution should be determined on Day 0; days 2, 3, or 4; and day 6 or 7 prior to administration of Step 2. If biodistribution is not acceptable, do not administer the therapeutic step. On day 6 or 7, calculate the patient specific activity of iodine I 131 tositumomab to deliver 75 cGy TBD or 65 cGy TBD (in mCi).

Step 2: Therapeutic step (Day 7):

Tositumomab 450 mg in NS 50 mL administered over 60 minutes

Iodine I 131 tositumomab:

Platelets ≥150,000/mm^3: Iodine I 131 calculated to deliver 75 cGy total body irradiation and tositumomab 35 mg over 20 minutes

Platelets ≥100,000/mm^3 and <150,000/mm^3: Iodine I 131 calculated to deliver 65 cGy total body irradiation and tositumomab 35 mg over 20 minutes

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.

Tositumomab: Infuse over 60 minutes

Iodine I 131 tositumomab: Infuse over 20 minutes

Reduce the rate of tositumomab or iodine 131 tositumomab infusion by 50% for mild-to-moderate infusion-related toxicities; interrupt for severe toxicity. Once severe toxicity has resolved, infusion may be restarted at half the previous rate. Prior to infusion, patients should be premedicated and a thyroid-protective agent should be started.

Storage

Tositumomab: Store under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from strong light. Following dilution, tositumomab is stable for 24 hour when refrigerated or 8 hours at room temperature.

Iodine I 131 tositumomab: Store frozen at less than or equal to -20°C in the original lead pots. Allow 60 minutes for thawing at ambient temperature. Solutions for infusion are stable for up to 8 hours at 2°C to 8°C (36°F to 46°F) or room temperature.

Reconstitution

Tositumomab: Withdraw and discard 32 mL of saline from a 50 mL bag of NS. Add contents of both 225 mg vials of tositumomab (total 32 mL) to remaining NS to make a final volume of 50 mL. Gently mix by inverting bag; do not shake.

Iodine I 131 tositumomab: Calculate volume required for an iodine I 131 tositumomab activity of 5 mCi (specification sheet provided with product). If the amount of tositumomab contained in the iodine I 131 tositumomab solution contains <35 mg of tositumomab, use the 35 mg vial of tositumomab to prepare a final concentration of tositumomab 35 mg. Using NS, the final volume should equal 30 mL.

ContraindicationsHypersensitivity to murine proteins or any component of the formulation; pregnancy; breast-feeding

Warnings/Precautions

Boxed warnings:

- Anaphylactoid/hypersensitivity reactions: See “Concerns related to adverse effects” below.
- Cytopenias: See “Concerns related to adverse effects” below.
- Radioactive isotopes: See “Special handling” below.
- Women of childbearing potential: See “Special populations” below.

Special handling:

- Hazardous agent - use appropriate precautions for handling and disposal.
- Radioactive isotopes: **[U.S. Boxed Warning]: Treatment involves radioactive isotopes; appropriate precautions in handling and administration must be followed.** Patients must be instructed in measures to minimize exposure of others.

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: **[U.S. Boxed Warning]: Hypersensitivity reactions (including anaphylaxis) have been reported.** Patients should be screened for human antimouse antibodies (HAMA); may be at increased risk of allergic or serious hypersensitivity reactions.
- Cytopenias: **[U.S. Boxed Warning]: Severe or life-threatening cytopenias (NCI CTC grade 3 or 4) have been reported in a large number of patients;** may be prolonged and severe. Hematologic toxicity is reported to be the most common adverse effect with 27% patients requiring supportive care. Safety has not been established in patients with >25% lymphoma marrow involvement, platelet count <100,000 cells/mm^3 or neutrophil count <1500 cells/mm^3.
- Hypothyroidism: Treatment may lead to hypothyroidism; patients should receive thyroid-blocking medications prior to the start of therapy.
- Infusion reactions: Patients should be premedicated to prevent infusion-related reactions.
- Secondary malignancies: Myelodysplastic syndrome (MDS), acute leukemia and nonhematologic malignancy, including skin cancer have been reported following use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; safety and efficacy have not been established.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Women of childbearing potential: **[U.S. Boxed Warning]: Women of childbearing potential should be advised of potential fetal risk;** effective contraceptive measures should be used for 12 months following treatment (males and females).

Other warnings/precautions:

- Appropriate use: For a single course of therapy only; multiple courses or use in combination with other chemotherapy or irradiation have not been studied.
- Immunizations: The safety and efficacy of live vaccines in patients who have received therapy with tositumomab have not been established.

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Women of childbearing potential should be advised of potential fetal risk.** Iodine-131 crosses the placenta and may cause severe and irreversible hypothyroidism in neonates. Pregnancy should be ruled out prior to therapy. Males and females should be instructed to use effective contraception for 12 months following treatment.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsRadioiodine and immunoglobulins are excreted in breast milk. Quantity of radioiodine may be greater than maternal serum concentrations. Women should be advised to discontinue nursing prior to therapy. The AAP considers radioactive iodine a compound which requires temporary cessation of breast-feeding.

Adverse Reactions

>10%:

Central nervous system: Fever (37%), pain (19%), chills (18%), headache (16%)

Dermatologic: Rash (17%)

Endocrine & metabolic: Hypothyroidism (7% to 19%)

Gastrointestinal: Nausea (36%), abdominal pain (15%), vomiting (15%), anorexia (14%), diarrhea (12%)

Hematologic:

Neutropenia (grade 3 or 4, 63%); thrombocytopenia (grade 3 or 4, 53%)

Time to nadir: 4-7 weeks

Duration: 30 days (>90 days in 5% to 7% of patients)

Neuromuscular & skeletal: Weakness (46%), myalgia (13%)

Respiratory: Cough (21%), pharyngitis (12%), dyspnea (11%)

Miscellaneous: Infusion-related reactions (26%, occurred within 14 days of infusion, included bronchospasm, chills, dyspnea, fever, hypotension, nausea, rigors, diaphoresis), infection (21%), HAMA-positive seroconversion (11%; up to 21% at 1 year)

1% to 10%:

Cardiovascular: Hypotension (7% to 10%), peripheral edema (9%), chest pain (7%), vasodilation (5%)

Central nervous system: Dizziness (5%), somnolence (5%)

Dermatologic: Pruritus (10%)

Gastrointestinal: Constipation (6%), dyspepsia (6%), weight loss (6%)

Local: Injection site hypersensitivity

Neuromuscular & skeletal: Arthralgia (10%), back pain (8%), neck pain (6%)

Respiratory: Rhinitis (10%), pneumonia (6%), laryngismus

Miscellaneous: Diaphoresis (8%), hypersensitivity reaction (6%), secondary leukemia/myelodysplastic syndrome (3%; up to 6% at 5 years), anaphylactoid reaction, secondary malignancies, serum sickness

Drug Interactions

Anticoagulants: May enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Test InteractionsMay interfere with tests using murine antibody technology.

Monitoring ParametersCBC with differential (prior to therapy and at least weekly for a minimum of 10 weeks); TSH (prior to therapy and yearly); serum creatinine (immediately prior to administration)

Following infusion of the iodine I 131 tositumomab dosimetric dose, the total body gamma camera counts and whole body images should be taken within 1 hour of the infusion and prior to urination, and 2-4 days after the infusion and following urination, and 6-7 days after the infusion and following urination.

Nursing: Physical Assessment/MonitoringPremedicate to reduce risk of infusion reactions. Assess results of laboratory tests prior to and immediately after therapy, and regularly thereafter, as recommended. Assess for signs of any adverse response (eg, infusion-related reactions have occurred up to 14 days of infusion). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential (prior to therapy and at least weekly); TSH (prior to therapy and yearly); serum creatinine (immediately prior to administration)

Following infusion of the iodine I 131 tositumomab dosimetric dose, the total body gamma camera counts and whole body images should be taken within 1 hour of the infusion and prior to urination, and 2-4 days after the infusion and following urination, and 6-7 days after the infusion and following urination.

Patient EducationDo not take any new medications during therapy without consulting prescriber. This medication can only be administered by intravenous infusion. You will be closely monitored prior to, during, and following infusion. Report immediately any chills, nausea, diaphoresis; difficulty swallowing or breathing; tightness in chest or chest pain. You will have frequent laboratory tests following therapy to assess effectiveness and response. Other medication will be prescribed related to this therapy. Take as directed; do not stop or alter dosage without consulting prescriber. You may experience nausea, vomiting, abdominal pain (if persistent, contact prescriber for medication); loss of appetite (small, frequent meals and frequent mouth care may help). Report immediately any chills, persistent or acute headache, fever, rash, swelling of extremities, chest pain, muscle or back pain, upper respiratory symptoms (sore throat, runny nose, persistent cough, pneumonia), signs of infection, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not get pregnant (females) or cause a pregnancy (males) during therapy or for 12 months following therapy. Consult prescriber for appropriate contraceptives if necessary or if you suspect you might be pregnant. This medication will

cause severe fetal defects. Do not give blood during therapy of for 12 months following therapy. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Not all components are shipped from the same facility. When ordering, ensure that all will arrive on the same day.

Kit [dosimetric package]: Tositumomab 225 mg/16.1 mL [2 vials], tositumomab 35 mg/2.5 mL [1 vial], and iodine I 131 tositumomab 0.1 mg/mL and 0.61mCi/mL (20 mL) [1 vial]

Kit [therapeutic package]: Tositumomab 225 mg/16.1 mL [2 vials], tositumomab 35 mg/2.5 mL [1 vial], and iodine I 131 tositumomab 1.1 mg/mL and 5.6 mCi/mL (20 mL) [1 or 2 vials]

Generic AvailableNo
ManufacturerCorixa Corp
Mechanism of ActionTositumomab is a murine IgG2a lambda monoclonal antibody which binds to the CD20 antigen, expressed on B-lymphocytes and on >90% of B-cell non-Hodgkin's lymphomas. Iodine I 131 tositumomab is a radio-iodinated derivative of tositumomab covalently linked to iodine 131. The possible actions of the regimen include apoptosis, complement-dependent cytotoxicity, antibody-dependent cellular cytotoxicity, and cell death. Administration results in depletion of CD20 positive cells.
Pharmacodynamics/Kinetics

Distribution: Tositumomab: V_d increased with high tumor burden, splenomegaly, or bone marrow involvement

Half-life elimination: Tositumomab:

Elimination: 36-48 hours

Terminal half-life decreased with high tumor burden, splenomegaly, or bone marrow involvement

Clearance: Blood: 68.2 mg/hour

Excretion: Iodine-131: Urine (98%) and decay

Pharmacotherapy PearlsThyroid protective agent: One of the following agents should be used starting at least 24 hours prior to the dosimetric dose and continued for 2 weeks after the therapeutic dose. Therapy should not begin without using one of the following agents:

SSKI: 4 drops 3 times/day

Lugol's solution: 20 drops 3 times/day

Potassium iodide: 130 mg once daily

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause sedation
Mental Health: Effects on Psychiatric TreatmentHematologic adverse reactions are common; use caution with clozapine, carbamazepine, valproic acid and derivatives, and mirtazapine. Rash is common; consider in differential in patients receiving lamotrigine. GI side effects are common; concurrent use with SSRIs may produce additive effects. May produce hypotension; concurrent use with psychotropic agents may produce additive blood pressure-lowering effects.
Index Terms131 I Anti-B1 Antibody; 131 I-Anti-B1 Monoclonal Antibody; Anti-CD20-Murine Monoclonal Antibody I-131; B1; B1 Antibody; Iodine I 131 Tositumomab and Tositumomab; Tositumomab I-131

Total Parenteral Nutrition

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(TOE tal par EN ter al noo TRISH un)

Pharmacologic Category[Caloric Agent](); [Intravenous Nutritional Therapy]()

Use: Labeled IndicationsInfusion of nutrient solutions into the bloodstream to support nutritional needs during a time when patient is unable to absorb nutrients via the gastrointestinal tract, cannot take adequate nutrition orally or enterally, or have had (or are expected to have) inadequate oral intake for 7-14 days

Dosing: AdultsNutritional supplementation: I.V.:

Total calories: Calculate using Harris-Benedict equation or based on stress level as indicated below:

Harris-Benedict Equation (BEE):

Females: 655.1 + [(9.56 x W) + (1.85 x H) - (4.68 x A)]

Males: 66.47 + [(13.75 x W) + (5 x H) - (6.76 x A)]

Then multiply BEE x (activity factor) x (stress factor)

W = weight in kg; H = height in cm; A = age in years

Activity factor = 1.2 sedentary, 1.3 normal activity, 1.4 active, 1.5 very active

Stress factor = 1.5 for trauma, stressed, or surgical patients and underweight (to promote weight gain); 2.0 for severe burn patients

Stress level:

Normal/mild stress level: 20-25 kcal/kg/day

Moderate stress level: 25-30 kcal/kg/day

Severe stress level: 30-40 kcal/kg/day

Pregnant women in second or third trimester: Add an additional 300 kcal/day

Fluid: mL/day = 30-40 mL/kg

Carbohydrate (dextrose):

5 g/kg/day or 3.5 mg/kg/minute (maximum rate: 4-7 mg/kg/minute)

Minimum recommended amount: 400 calories/day or 100 g/day

Protein (amino acids):

Maintenance: 0.8-1 g/kg/day

Normal/mild stress level: 1-1.2 g/kg/day

Moderate stress level: 1.2-1.5 g/kg/day

Severe stress level: 1.5-2 g/kg/day

Burn patients (severe): Increase protein until significant wound healing achieved

Solid organ transplant: Perioperative: 1.5-2 g/kg/day

Renal failure:

Acute (severely malnourished or hypercatabolic): 1.5-1.8 g/kg/day

Chronic, with dialysis: 1.2-1.3 g/kg/day

Chronic, without dialysis: 0.6-0.8 g/kg/day

Continuous hemofiltration: ≥1 g/kg/day

Hepatic failure:

- Acute management when other treatments have failed:
  - With encephalopathy: 0.6-1 g/kg/day
  - Without encephalopathy: 1-1.5 g/kg/day
- Chronic encephalopathy: Use branch chain amino acid enriched diets only if unresponsive to pharmacotherapy

Pregnant women in second or third trimester: Add an additional 10-14 g/day

Fat:

Initial: 20% to 40 % of total calories (maximum: 60% of total calories or 2.5 g/kg/day); **Note:** Monitor triglycerides while receiving intralipids.

Safe for use in pregnancy

I.V. lipids are safe in adults with pancreatitis if triglyceride levels <400 mg/dL

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNutritional supplementation:

Neonates: I.V.: **Note:** When indicated for premature neonates, start on day 1 of life if possible.

Total calories:

- Term: 85-105 kcal/kg/day
- Preterm (stable): 90-120 kcal/kg/day

Fluid:

- <1.5 kg: 130-150 mL/kg/day
- 1.5-2 kg: 110-130 mL/kg/day
- 2-10 kg: 100 mL/kg/day

Carbohydrate (dextrose):40% to 50 % of caloric intake; advance as tolerated

- Term: Initial: 6-8 mg/kg/minute; goal: 10-14 mg/kg/minute
- Premature: Initial: 6 mg/kg/minute; goal: 10-13 mg/kg/minute

Protein (amino acids):

- Term: Initial: 2.5 g/kg/day; goal: 3 g/kg/day
- Extremely (<1000 g) and very (<1500 g) low-birth-weight (stable): Initial: 1-1.5 g/kg/day; goal: 3.5-3.85 g/kg/day to promote utero growth rates.
- Sepsis, hypoxia: Initial: 1 g/kg/day; goal: 3-3.85 g/kg/day

Fat:

- Term: Initial: 0.5-1 g/kg/day (maximum: 3 g/kg/day); administer over 24 hours
- Preterm: Initial: 0.25-0.5 g/kg/day (maximum: 3 g/kg/day or 1 g/kg/day if on phototherapy); administer over 24 hours
- **Note:** Monitor triglycerides while receiving intralipids. If triglycerides >200 mg/dL, stop infusion and restart at 0.5-1g/kg/day

Heparin: 1 unit/mL of parenteral nutrition fluids should be added to enhance clearance of lipid emulsions

Children: I.V.: **Note:** Give within 5-7 days if unable to meet needs orally or with enteral nutrition:

Total calories:

- <6 months: 85-105 kcal/kg/day
- 6-12 months: 80-100 kcal/kg/day
- 1-7 years: 75-90 kcal/kg/day
- 7-12 years: 50-75 kcal/kg/day
- 12-18 years: 30-50 kcal/kg/day

Fluid:

- 2-10 kg: 100 mL/kg
- >10-20 kg: 1000 mL for 10 kg plus 50 mL/kg for each kg >10

>20 kg: 1500 mL for 10 kg plus 20 mL/kg for each kg >20

Carbohydrate (dextrose): 40% to 50% of caloric intake

<1 year: Initial: 6-8 mg/kg/minute; goal: 10-14 mg/kg/minute

1-10 years: Initial: 10% to 12.5%; daily increase: 5% increments (maximum: 15 mg/kg/minute)

>10 years: Initial: 10% to 15%; daily increase: 5% increments (maximum: 8.5 mg/kg/minute)

Protein (amino acids):

1-12 months: Initial: 2-3 g/kg/day; daily increase: 1 g/kg/day (maximum: 3 g/kg/day)

1-10 years: Initial: 1-2 g/kg/day; daily increase: 1 g/kg/day (maximum: 2-2.5 g/kg/day)

>10 years: Initial: 0.8-1.5 g/kg/day; daily increase: 1 g/kg/day (maximum: 1.5-2 g/kg/day)

Fat: Initial: 1 g/kg/day; daily increase: 1 g/kg/day (maximum: 3 g/kg/day); **Note:** Monitor triglycerides while receiving intralipids.

Calculations

- Adjusted Body Weight
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V.For I.V. administration only, usually via a central venous catheter; can be administered by continuous infusion over 24 hours or cyclic infusion over 12-14 hours. Cyclic infusion is used with a tapering-up period at the beginning and a tapering-down period at the end to avoid hyper-/hypoglycemia. For infants <2 years, taper over 1-2 hours.

Administration: I.V. DetailChange tubing after each infusion. Hang fat emulsion higher than other fluids (has low specific gravity and could run up into other lines). Infuse via pump using either peripheral or central venous line. Do not use in-line filter.

StorageUSP Chapter 797 Guidelines consider TPN a medium-risk preparation and state that (in the absence of passing a sterility test) storage period should not exceed 30 hours at room temperature, 7 days at cold temperature, and 45 days in a solid frozen state at -20°C or colder. For patients on home TPN, multiple vitamins should be added prior to TPN administration, due to limited stability of multiple vitamins.

CompatibilitySee detailed reference.

ContraindicationsVaries by composition:

Lipid-containing formulations are contraindicated in patients with hypersensitivity to fat emulsion or any component of the formulation; severe egg or legume (soybean) allergies; pathologic hyperlipidemia, lipoid nephrosis, pancreatitis with hyperlipemia

Dextrose is contraindicated in patients with hypersensitivity to corn or corn products; hypertonic solutions in patients with intracranial or intraspinal hemorrhage; glucose-galactose malabsorption syndrome

Amino acids are contraindicated in patients with hypersensitivity to one or more amino acids; severe liver disease or hepatic coma

Warnings/Precautions

Concerns related to adverse effects:

- Refeeding syndrome: Use with caution in patients at risk for refeeding syndrome. Refeeding syndrome is a medical emergency; it can consist of electrolyte disturbances (eg, potassium, phosphorus), respiratory distress, and cardiac arrhythmias, resulting in cardiopulmonary arrest. It is usually seen in patients with long-standing or severe malnutrition; initiate cautiously; approach goals slowly. Do not overfeed patients; caloric replacement should match as closely as possible to intake.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes or insulin resistance.

- Hepatic impairment: Use with caution and limit protein in patients with hepatic disease.

- Volume overload: Use with caution in patients who may be sensitive to volume overload (eg, HF, renal failure, hepatic failure).

Other warnings/precautions:

- Abrupt withdrawal: If TPN is discontinued abruptly, infuse 10% dextrose at same rate and monitor blood glucose for hypoglycemia.

- Monitoring: Monitor fluid and electrolyte status carefully.

Adverse ReactionsFrequency not defined (unless noted).

Endocrine & metabolic: Fluid overload, hypercapnia, hyperglycemia, hyper-/hypokalemia, hyper-/hypophosphatemia, metabolic bone disease, nonanion gap metabolic acidosis, refeeding syndrome

Hepatic: Cholestasis, cirrhosis (<1%), gallstones, liver function tests increased, pancreatitis, steatosis, triglycerides increased

Renal: Azotemia, BUN increased

Miscellaneous: Bacteremia, catheter-induced infection, exit-site infections

Monitoring Parameters

Electrolytes: Sodium, potassium, chloride, and bicarbonate should be monitored frequently upon initiation and until stable; phosphate should be monitored closely in patients with pulmonary disease.

Efficacy: Nutrition and outcome parameters should be measured serially.

Glucose: In patients with diabetes or patients with glucose intolerance risk factors, monitor closely. Monitor frequently upon initiation of therapy and with any changes in insulin dose or renal function.

Line site: Monitor for signs and symptoms of infection.

Liver function tests: Monitor periodically.

Triglycerides: Before initiation of lipid therapy and at least weekly during therapy.

Refeeding syndrome: Patients at risk should have phosphorus, magnesium, potassium, and glucose levels monitored closely at initiation.

Bone densitometry: Perform upon initiation of long-term therapy.

Vitamin A status: Should be carefully monitored in patients with chronic renal failure.

Neonates: Sodium, calcium and phosphate should be monitored closely. Frequent (some advise daily) platelet counts should be performed in neonatal patients receiving parenteral lipids.

Monitoring: Lab Tests

Electrolytes: Sodium, potassium, chloride, and bicarbonate should be monitored frequently upon initiation and until stable; phosphate should be monitored closely in patients with pulmonary disease.

Efficacy: Nutrition and outcome parameters should be measured serially.

Glucose: In patients with diabetes or patients with glucose intolerance risk factors, monitor closely. Monitor frequently upon initiation of therapy and with any changes in insulin dose or renal function.

Line site: Monitor for signs and symptoms of infection.

Liver function tests: Monitor periodically.

Triglycerides: Before initiation of lipid therapy and at least weekly during therapy.

Refeeding syndrome: Patients at risk should have phosphorus, magnesium, potassium, and glucose levels monitored closely at initiation.

Bone densitometry: Perform upon initiation of long-term therapy.

Vitamin A status: Should be carefully monitored in patients with chronic renal failure.

Neonates: Sodium, calcium and phosphate should be monitored closely. Frequent (some advise daily) platelet counts should be performed in neonatal patients receiving parenteral lipids.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling. TPN is usually compounded from optimal combinations of macronutrients (water, protein, dextrose, and lipids) and micronutrients (electrolytes, trace elements, and vitamins) to meet the specific nutritional requirements of a patient. Individual hospitals may have designated standard TPN formulas. There are a few commercially-available amino acids with electrolytes solutions; however, these products may not meet an individual's specific nutrition requirements.

See Dextrose and Fat Emulsion monographs for additional information.

Related Information

- Fat Emulsion

Pharmacotherapy Pearls

Diabetes: Avoid excess calories.

Burns: Assess nutrition requirements with indirect calorimetry if possible.

Obesity: Assess nutrition requirements with indirect calorimetry if possible and give hypocaloric nutrition with supplemental protein.

Pulmonary disease: Use a fluid-restricted formula for ARDS. Energy (carbohydrate) intake should be kept at or below estimated needs in patients with pulmonary disease and hypercapnia.

1 g protein = 4 kcal

1 g dextrose = 3.4 kcal

1 g fat = 9 kcal

10% fat emulsion = 1.1 kcal

20% fat emulsion = 2 kcal

30% fat emulsion = 3 kcal

Adult standard daily electrolyte requirements:

- Acetate: As needed to maintain acid-base balance
- Calcium: 10-15 mEq
- Chloride: As needed to maintain acid-base balance
- Magnesium 8-20 mEq
- Phosphorus: 20-40 mmol
- Potassium: 1-2 mEq/kg
- Sodium: 1-2 mEq/kg

Adult daily requirements for parenteral vitamins:

- Ascorbic acid (C): 200 mg
- Biotin: 60 mcg
- Cyanocobalamin (B_{12}): 5 mcg
- Folic acid: 600 mcg
- Niacin (B_3): 40 mg
- Pantothenic acid: 15 mg
- Pyridoxine (B_6): 6 mg
- Riboflavin (B_2): 3.6 mg
- Thiamine (B_1): 6 mg
- Vitamin A: 3300 int. units
- Vitamin D: 200 int. units
- Vitamin E: 10 int. units
- Vitamin K: 150 mcg

Adult daily requirements for parenteral trace elements:

- Chromium: 10-15 mcg
- Copper: 0.3-0.5 mg
- Iron: Not routinely added
- Manganese: 60-100 mcg
- Selenium: 20-60 mcg
- Zinc: 2.5-5 mg

See Dextrose and Fat Emulsion monographs for additional information.

Infants: 2 mcg/kg

Children: 2 mcg/kg (maximum: 30 mcg)

Zinc:

Infants, preterm: 400 mcg/kg

Infants, term <3 months: 250 mcg/kg

Infants, term >3 months: 100 mcg/kg

Children: 50 mcg/kg (maximum: 5 mg)

[1] Omit in patients with renal dysfunction.

[2] Omit in patients with obstructive jaundice.

[3] Current available commercial products are not in appropriate ratios to maintain this recommendation; doses of up to 10 mcg/kg have been used.

[4] Indicated for use in long-term parenteral nutrition patients.

Pregnancy Risk FactorC

Ethanol/Nutrition/Herb InteractionsFood: Decreased absorption of oral zinc when administered with bran products, protein, and phytates.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [combination products]:

Multitrace®-4: Chromium 4 mcg, copper 0.4 mg, manganese 0.1 mg, and zinc 1 mg per 1 mL (10 mL) [contains aluminum, benzyl alcohol]

Multitrace®-4 Concentrate: Chromium 10 mcg, copper 1 mg, manganese 0.5 mg, and zinc 5 mg per 1 mL (1 mL) [contains aluminum]; chromium 10 mcg, copper 1 mg, manganese 0.5 mg, and zinc 5 mg per 1 mL (10 mL) [contains benzyl alcohol]

Multitrace®-4 Neonatal: Chromium 0.85 mcg, copper 0.1 mg, manganese 0.025 mg, and zinc 1.5 mg per 1 mL (2 mL) [contains aluminum]

Multitrace®-5: Chromium 4 mcg, copper 0.4 mg, manganese 0.1 mg, selenium 20 mcg, and zinc 1 mg per 1 mL (10 mL) [contains aluminum, benzyl alcohol]

Multitrace®-5 Concentrate: Chromium 10 mcg, copper 1 mg, manganese 0.5 mg, selenium 60 mcg, and zinc 5 mg per 1 mL (1 mL) [contains aluminum]; chromium 10 mcg, copper 1 mg, manganese 0.5 mg, selenium 60 mcg, and zinc 5 mg per 1 mL (10 mL) [contains benzyl alcohol]

Trace Elements 4 Pediatric: Chromium 1 mcg, copper 0.1 mg, manganese 0.03 mg, and zinc 0.5 mg per 1 mL (10 mL) [contains aluminum, benzyl alcohol]

Injection, solution [combination products, preservative free]:

4 Trace Elements: Chromium 2 mcg, copper 0.2 mg, manganese 0.16 mg, and zinc 0.8 mg per 1 mL (5 mL, 50 mL) [contains aluminum]

Multitrace®-4 Pediatric: Chromium 1 mcg, copper 0.1 mg, manganese 0.025 mg, and zinc 1 mg per 1 mL (3 mL) [contains aluminum]

Pronunciation(TRA ma dole)

U.S. Brand NamesUltram®; Ultram® ER

Canadian Brand NamesRalivia™ ER; Tridural™; Zytram® XL

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsRelief of moderate to moderately-severe pain

Use: DentalRelief of moderate to moderately-severe dental pain

Dosing: Adults**Moderate-to-severe chronic pain:** Oral:

Immediate release formulation: 50-100 mg every 4-6 hours (not to exceed 400 mg/day)

For patients not requiring rapid onset of effect, tolerability may be improved by starting dose at 25 mg/day and titrating dose by 25 mg every 3 days, until reaching 25 mg 4 times/day. The total daily dose may then be increased by 50 mg every 3 days as tolerated, to reach dose of 50 mg 4 times/day. After titration, 50-100 mg may be given every 4-6 hours as needed up to a maximum 400 mg/day.

Extended release formulation:

Ultram® ER: Patients not currently on immediate-release: 100 mg once daily; titrate every 5 days (maximum: 300 mg/day); Patients currently on immediate-release: Calculate 24-hour immediate release total and initiate total daily dose (round dose to the next lowest 100 mg increment); titrate (maximum: 300 mg/day)

Ralivia™ ER (Canadian labeling, not available in U.S.): 100 mg once daily; titrate every 5 days as needed based on clinical response and severity of pain (maximum: 300 mg/day)

Tridural™ (Canadian labeling, not available in U.S.): 100 mg once daily; titrate by 100 mg/day every 2 days as needed based on clinical response and severity of pain (maximum: 300 mg/day)

Zytram® XL (Canadian labeling, not available in U.S.): 150 mg once daily; if pain relief is not achieved may titrate by increasing dosage incrementally, with sufficient time to evaluate effect of increased dosage; generally not more often than every 7 days (maximum: 400 mg/day)

Dosing: ElderlyOral: >75 years:

Immediate release: 50 mg every 6 hours (not to exceed 300 mg/day); see dosing adjustments for renal and hepatic impairment.

Extended release: Use with great caution. Refer to adult dosing.

Dosing: Renal Impairment

Immediate release: Cl_{cr} <30 mL/minute: Administer 50-100 mg dose every 12 hours (maximum: 200 mg/day).

Extended release: Should not be used in patients with Cl_{cr} <30 mL/minute.

Dosing: Hepatic Impairment

Immediate release: Cirrhosis: Recommended dose: 50 mg every 12 hours.

Extended release: Should not be used in patients with severe (Child-Pugh Class C) hepatic dysfunction.

Calculations

- Creatinine Clearance: Adults

Administration: OralExtended release tablet: Swallow whole; do not crush, chew, or split

Dietary ConsiderationsMay be taken with or without food. Extended release formulation: Be consistent; always give with food or always give on an empty stomach.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to tramadol, opioids, or any component of the formulation; opioid-dependent patients; acute intoxication with alcohol, hypnotics, centrally-acting analgesics, opioids, or psychotropic drugs

Note: Based on Canadian product labeling:

Tramadol is contraindicated during or within 14 days following MAO inhibitor therapy

Extended release formulations (Ralivia™ ER [CAN], Tridural™[CAN], and Zytram® XL [CAN]): Additional contraindications: Severe (Cl_{cr} <30 mL/minute) renal dysfunction, severe (Child-Pugh Class C) hepatic dysfunction

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Rare but serious anaphylactoid reactions (including fatalities) often following initial dosing have been reported. Pruritus, hives, bronchospasm, angioedema, toxic epidermal necrolysis (TEN), and Stevens-Johnson syndrome also have been reported with use. Previous anaphylactoid reactions to opioids may increase risks for similar reactions to tramadol.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Seizures: Even when taken within the recommended dosage seizures may occur; risk is increased in patients receiving serotonin reuptake inhibitors (SSRIs or anorectics), other opioids, tricyclic antidepressants, other cyclic compounds (including cyclobenzaprine, promethazine), neuroleptics, MAO inhibitors, or drugs which may lower seizure threshold. Patients with a history of seizures, or with a risk of seizures (head trauma, metabolic disorders, CNS infection, malignancy, or during alcohol/drug withdrawal) are also at increased risk.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists.
- Ethanol use: Use with caution in heavy alcohol users.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution and reduce dosage in patients with mild-to-moderate hepatic impairment; extended release formulations should not be used in severe hepatic impairment (Child-Pugh Class C)
- Renal impairment: Use with caution and reduce dosage in patients with mild-to-moderate renal impairment; extended release formulations should not be used in severe renal impairment Cl_{cr} <30 mL/minute.
- Respiratory disease: Patients with respiratory disorders (eg, significant chronic obstructive pulmonary disease (COPD), cor pulmonale, hypoxia, hypercapnia) may be at greater risk of respiratory depression.
- Suicide risk: Avoid use in patients who are suicidal.

Concurrent drug therapy issues:

- CNS depressants: Use with caution and reduce dosage when administering to patients receiving other CNS depressants; may cause CNS depression and/or respiratory depression.
- Serotonergic agents: Avoid use with serotonergic agents such as TCAs, MAO inhibitors (contraindicated in Canadian product labeling), triptans, venlafaxine, trazodone, lithium, sibutramine, meperidine, dextromethorphan, St John’s wort, SNRIs and SSRIs; concomitant use has been associated with the development of serotonin syndrome.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Extended-release formulation should be used with extreme caution in the elderly (particularly >75 years of age); may be more sensitive to adverse effects. Reduce initial dose.
- Pediatrics: Immediate release formulation: Safety and efficacy have not been established in children <16 years of age. Extended release formulation: Safety and efficacy have not been established in children <18 years of age.

Dosage form specific issues:

- Extended release tablets: Caution patients to swallow tablets whole. Rapid release absorption of tramadol from tablets that are broken, crushed, or chewed may lead to a potentially-lethal overdose.

Other warnings/precautions:

- Withdrawal: Tolerance or drug dependence may result from extended use (withdrawal symptoms have been reported); abrupt discontinuation should be avoided. Tapering of dose at the time of discontinuation limits the risk of withdrawal symptoms.

Geriatric ConsiderationsOne study in the elderly found that tramadol 50 mg was similar in efficacy as acetaminophen 300 mg with codeine 30 mg. In Ultram® ER trials, elderly patients experienced more adverse effects than younger adults, particularly constipation, fatigue, weakness, postural hypotension, and dyspepsia. For this reason, the extended release formulation should probably be avoided in the elderly, or only used with great caution.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in animal studies. Tramadol has been shown to cross the human placenta when administered during labor. Postmarketing reports following tramadol use during pregnancy include neonatal seizures, withdrawal syndrome, fetal death, and stillbirth. Not recommended for use during labor and delivery.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSixteen hours following a single 100 mg I.V. dose, the amount of tramadol found in breast milk was 0.1% of the maternal dose. Use is not recommended by the manufacturer for postdelivery analgesia in nursing mothers.

Adverse Reactions

>10%:

  Cardiovascular: Flushing (8% to 16%)

  Central nervous system: Dizziness (16% to 33%), headache (12% to 32%), insomnia (7% to 11%), somnolence (7% to 25%)

  Dermatologic: Pruritus (6% to 12%)

  Gastrointestinal: Constipation (10% to 46%), nausea (15% to 40%), vomiting (5% to 17%), dyspepsia (1% to 13%)

  Neuromuscular & skeletal: Weakness (4% to 12%)

1% to 10%:

  Cardiovascular: Chest pain (1% to <5%), postural hypotension (2% to 5%), vasodilation (1% to <5%)

  Central nervous system: Anxiety (1% to <5%), confusion (1% to <5%), coordination impaired (1% to <5%), depression (1% to <5%), euphoria (1% to <5%), hypoesthesia (1% to <5%), lethargy (1% to <5%), nervousness (1% to <5%), pain (1% to <5%), pyrexia (1% to <5%), restlessness (1% to <5%), malaise (<1% to <5%)

  Dermatologic: Dermatitis (1% to <5%), rash (1% to <5%)

  Endocrine & metabolic: Hot flashes (2% to 9%), menopausal symptoms (1% to <5%)

  Gastrointestinal: Diarrhea (5% to 10%), xerostomia (5% to 10%), anorexia (1% to <6%), abdominal pain (1% to <5%), appetite decreased (1% to <5%), weight loss (1% to <5%), flatulence (<1% to <5%)

  Genitourinary: Urinary tract infection (1% to <5%), urinary frequency (<1% to <5%), urinary retention (<1% to <5%)

  Neuromuscular & skeletal: Arthralgia (1% to <5%), back pain (1% to <5%), hypertonia (1% to <5%), rigors (1% to <5%), paresthesia (1% to <5%), tremor (1% to <5%), creatinine phosphokinase increased (1% to <5%)

  Ocular: Blurred vision (1% to <5%), miosis (1% to <5%)

  Respiratory: Bronchitis (1% to <5%), congestion (nasal/sinus) (1% to <5%), cough (1% to <5%), dyspnea (1% to <5%), nasopharyngitis (1% to <5%), rhinorrhea (1% to <5%), sinusitis (1% to <5%), sneezing (1% to <5%), sore throat (1% to <5%), upper respiratory infection (1% to <5%)

  Miscellaneous: Diaphoresis (2% to 9%), flu-like syndrome (1% to < 5%), shivering (<1% to <5%)

<1% (Limited to important or life-threatening): Abnormal ECG, abnormal gait, agitation, allergic reaction, amnesia, anaphylactoid reactions, anaphylaxis, angioedema, appendicitis, ALT increased, AST increased, bronchospasm, cataracts, cellulitis, cholecystitis, cholelithiasis, clamminess, cognitive dysfunction, concentration difficulty, creatinine increased, deafness, disorientation, dreams abnormal, dysuria, ear infection, edema, gastroenteritis, gastrointestinal bleeding, hallucination, hematuria, hemoglobin decreased, hepatitis, hyperglycemia, hyper-/hypotension, irritability, joint stiffness, libido decreased, liver enzymes increased, liver failure, menstrual disorder, MI, migraine, muscle cramps, muscle spasms, muscle twitching, myalgia, myocardial ischemia, night sweats, palpitation, pancreatitis, peripheral edema, peripheral ischemia, pneumonia, proteinuria, pulmonary edema, pulmonary embolism, sedation, seizure, serotonin syndrome, sleep disorder, speech disorder, Stevens-Johnson syndrome, stomatitis, suicidal tendency, syncope, taste perversion, tachycardia, tinnitus, toxic epidermal necrolysis, urticaria, vertigo, vesicles

A withdrawal syndrome may occur with abrupt discontinuation; includes anxiety, diarrhea, hallucinations (rare), nausea, pain, piloerection, rigors, sweating, and tremor. Uncommon discontinuation symptoms may include severe anxiety, panic attacks, or paresthesia.

Metabolism/Transport Effects**Substrate** of CYP2D6 (major), 3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: TraMADol may enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tricyclic Antidepressants: May enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food:

Immediate release: Does not affect the rate or extent of absorption.

Extended release: Reduced C_{max} and AUC and T_{max} occurred 3 hours earlier when taken with a high-fat meal.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersPain relief, respiratory rate, blood pressure, and pulse; signs of tolerance or abuse

Reference Range100-300 ng/mL; however, serum level monitoring is not required

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness and adverse reactions or overdose at beginning of therapy and periodically during therapy. May cause physical and/or psychological dependence. Taper dose when discontinuing to avoid withdrawal symptoms. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationExtended release tablet must be swallowed whole; do not break, chew, or crush. If self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or cough preparations) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience headache, drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report severe unresolved constipation, respiratory difficulty or shortness of breath, excessive sedation or increased insomnia and restlessness, rash or hives, changes in urinary pattern or menstrual pattern, seizures, muscle weakness or tremors, or chest pain or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, as hydrochloride: 50 mg

Ultram®: 50 mg

Tablet, extended release, as hydrochloride:

Ultram® ER: 100 mg, 200 mg, 300 mg

Ralivia™ ER [CAN]: 100 mg, 200 mg, 300 mg [not available in the U.S.]

Tridural™ [CAN]: 100 mg, 200 mg, 300 mg [not available in the U.S.]

Zytram® XL [CAN]: 150 mg, 200 mg, 300 mg, 400 mg [not available in the U.S.]

Generic AvailableYes: Excludes extended release tablet

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Ultram ER)

100 mg (30): $108.08

200 mg (30): $182.00

300 mg (30): $224.36

Tablets (Tramadol HCl)

50 mg (30): $16.99

Tablets (Ultram)

50 mg (30): $64.03

Mechanism of ActionTramadol and active metabolite (M1) binds to µ-opiate receptors in the CNS causing inhibition of ascending pain pathways, altering the perception of and response to pain; also inhibits the reuptake of norepinephrine and serotonin, which also modifies the ascending pain pathway

Pharmacodynamics/Kinetics

Onset of action: Immediate release: ~1 hour

Duration: 9 hours

Absorption: Immediate release formulation: Rapid and complete; Extended release formulation: Delayed

Distribution: V_d: 2.5-3 L/kg

Protein binding, plasma: 20%

Metabolism: Extensively hepatic via demethylation, glucuronidation, and sulfation; has pharmacologically active metabolite formed by CYP2D6 (M1; O-desmethyl tramadol)

Bioavailability: Immediate release: 75%; Extended release: Ultram® ER: 85% to 90% (as compared to immediate release), Zytram® XL, Tridural™: 70%

Half-life elimination: Tramadol: ~6-8 hours; Active metabolite: 7-9 hours; prolonged in elderly, hepatic or renal impairment; Zytram® XL: ~16 hours; Ralivia™ ER, Tridural™: ~5-9 hours

Time to peak: Immediate release: ~2 hours; Extended release: Ultram® ER: ~12 hours, Tridural™: ~4 hours

Excretion: Urine (30% as unchanged drug; 60% as metabolites)

Dental Health Professional ConsiderationsLiterature reports suggest that the efficacy of tramadol in oral surgery pain is equivalent to the combination of aspirin and codeine. One study (Olson et al 1990) showed acetaminophen and dextropropoxyphene combination to be superior to tramadol and another study showed tramadol to be superior to acetaminophen and dextropropoxyphene combination. Tramadol appears to be at least equal to if not better than codeine alone. Seizures have been reported with the use of tramadol.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or restlessness

Mental Health: Effects on Psychiatric TreatmentContraindicated with opioid-dependent patients, MAO inhibitors, psychotropics; carbamazepine may decrease the effects of tramadol; concurrent use with MAO inhibitors and TCAs may produce seizures; tramadol has MAO inhibitor activity and should be used cautiously with other antidepressants

Anesthesia and Critical Care Concerns/Other ConsiderationsTramadol 50 mg is comparable to codeine 60 mg; tramadol 100 mg is comparable to aspirin 650 mg/codeine 60 mg. Tramadol is 5-10 times less potent than morphine and reported to cause less respiratory depression.

Index TermsTramadol Hydrochloride

Trandolapril and Verapamil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tran DOE la pril & ver AP a mil)

U.S. Brand NamesTarka®

Canadian Brand NamesTarka®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Calcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension; however, not indicated for initial treatment of hypertension

Dosing: Adults**Hypertension:** Oral: Individualize dose. Patients receiving trandolapril (up to 8 mg) and verapamil (up to 240 mg) in separate tablets may wish to receive Tarka® at equivalent dosages once daily.

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Renal ImpairmentUsual regimen need not be adjusted unless patient's creatinine clearance is <30 mL/minute. Titration of individual components must be done prior to switching to combination product

Dosing: Hepatic ImpairmentHas not been evaluated in hepatic impairment. Verapamil is hepatically metabolized, adjustment of dosage in hepatic impairment is recommended.

ContraindicationsHypersensitivity to trandolapril, verapamil, or other ACE inhibitors, or any other component of the formulation; severe left ventricular dysfunction; hypotension (systolic blood pressure <90 mm Hg); cardiogenic shock; sick sinus syndrome (except in patients with a functioning pacemaker); second- or third-degree heart block (except in patients with a functioning pacemaker);atrial fibrillation or atrial flutter with an accessory bypass tract (eg, Wolff-Parkinson-White, Lown-Ganong-Levine syndromes); history of angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Verapamil Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising the airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Conduction abnormalities: Verapamil can cause first-degree AV block or sinus bradycardia; other conduction abnormalities are rare. Unless patients have a functioning pacemaker, contraindicated with sick sinus syndrome or second- or third-degree degree heart block.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Peripheral edema: The most common side effect of verapamil is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.
- Cirrhosis: Dosage adjustments of trandolapril are needed in patients with hepatic cirrhosis.
- Collagen vascular disease: Use trandolapril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.
- Heart failure: Avoid verapamil in heart failure; can exacerbate condition. Contraindicated with severe left ventricular dysfunction or cardiogenic shock.
- Hepatic impairment: Use verapamil with caution in patients with hepatic impairment; may require lower starting dose.
- Hypertrophic obstructive cardiomyopathy (HOCM): Use with caution in patients with HOCM.
- Renal artery stenosis: Use trandolapril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment is needed in severe renal dysfunction (Cl_{cr} <30 mL/minute). Avoid rapid dosage escalation which may lead to further renal impairment.

Concurrent drug therapy issues:

- Digoxin: Verapamil significantly increases digoxin serum concentrations; adjust digoxin dose.
- Neuromuscular-blocking agents: Verapamil may prolong recovery from nondepolarizing neuromuscular-blocking agents.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual monographs.
LactationEnters breast milk/contraindicated
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsVerapamil: **Substrate** of CYP1A2 (major), 2B6 (minor), 2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C8/9 (weak), 2D6 (weak), 3A4 (moderate)
Drug Interactions

Alcohol (Ethyl): Verapamil may increase the serum concentration of Alcohol (Ethyl). *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: Calcium Channel Blockers (Nondihydropyridine) may enhance the bradycardic effect of Amiodarone. Sinus arrest has been reported. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Beta-Blockers: Calcium Channel Blockers (Nondihydropyridine) may enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

BusPIRone: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Calcium Channel Blockers (Nondihydropyridine) may enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of CarBAMazepine. CarBAMazepine may increase the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

Cardiac Glycosides: Calcium Channel Blockers (Nondihydropyridine) may enhance the AV-blocking effect of Cardiac Glycosides. Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Colchicine: Verapamil may enhance the nephrotoxic effect of Colchicine. Colchicine may increase the serum concentration of Verapamil. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CycloSPORINE: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of CycloSPORINE. CycloSPORINE may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dofetilide: Verapamil may increase the serum concentration of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Eletriptan. *Risk C: Monitor therapy*

Eplerenone: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Fexofenadine: Verapamil may increase the bioavailability of Fexofenadine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Lithium: Calcium Channel Blockers (Nondihydropyridine) may enhance the neurotoxic effect of Lithium. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Lithium. Decreased or unaltered lithium concentrations have also been reported with this combination. *Risk C: Monitor therapy*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Calcium Channel Blockers (Nondihydropyridine) may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of QuiNIDine. *Risk D: Consider therapy modification*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Ranolazine: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

Risperidone: Verapamil may increase the serum concentration of Risperidone. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Salicylates: Calcium Channel Blockers (Nondihydropyridine) may enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure and heart rate; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, variable release:

1/240: Trandolapril 1 mg [immediate release] and verapamil hydrochloride 240 mg [sustained release]

2/180: Trandolapril 2 mg [immediate release] and verapamil hydrochloride 180 mg [sustained release]

2/240: Trandolapril 2 mg [immediate release] and verapamil hydrochloride 240 mg [sustained release]

4/240: Trandolapril 4 mg [immediate release] and verapamil hydrochloride 240 mg [sustained release]

Generic AvailableNo

ManufacturerKnoll Pharmaceutical Company

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Tarka)

1-240 mg (30): $87.21

2-240 mg (30): $89.90

4-240 mg (30): $91.79

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Trandolapril
- Verapamil

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, nervousness, or insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels; concurrent use with low potency antipsychotics and TCAs may produce additive hypotensive effects; barbiturates may decrease verapamil serum concentrations; verapamil may increase carbamazepine serum concentrations

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for trandolapril and verapamil combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. See Cardiovascular Considerations for individual agents.

Index TermsVerapamil and Trandolapril

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tran DOE la pril)

U.S. Brand NamesMavik®

Canadian Brand NamesMavik™

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension alone or in combination with other antihypertensive agents; treatment of heart failure or left ventricular dysfunction after myocardial infarction

Use: Unlabeled/InvestigationalAs a class, ACE inhibitors are recommended in the treatment of heart failure; to delay the progression of nephropathy and reduce risks of cardiovascular events in hypertensive patients with type 1 or 2 diabetes mellitus

Dosing: Adults

Hypertension: Oral; Initial dose in patients not receiving a diuretic: 1 mg/day (2 mg/day in black patients). Adjust dosage according to the blood pressure response. Make dosage adjustments at intervals of ≥1 week. Most patients have required dosages of 2-4 mg/day. There is a little experience with doses >8 mg/day. Patients inadequately treated with once daily dosing at 4 mg may be treated with twice daily dosing. If blood pressure is not adequately controlled with trandolapril monotherapy, a diuretic may be added.

Usual dose range (JNC 7): 1-4 mg once daily

Heart failure postmyocardial infarction or left ventricular dysfunction postmyocardial infarction: Oral: Initial: 1 mg/day; titrate patients (as tolerated) towards the target dose of 4 mg/day. If a 4 mg dose is not tolerated, patients can continue therapy with the greatest tolerated dose.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} ≤30 mL/minute: Administer lowest doses, starting at 0.5 mg/day.

Dosing: Hepatic ImpairmentPatients with hepatic cirrhosis: Start dose at 0.5 mg.

Calculations

- Creatinine Clearance: Adults

ContraindicationsHypersensitivity to trandolapril or any component of the formulation; history of angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse reactions:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising the airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Cirrhosis: Dosage adjustments are needed in patients with hepatic cirrhosis.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment is needed in severe renal dysfunction (Cl_{cr} <30 mL/minute). Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with CHF and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Adjust for renal function. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, trandolapril is considered pregnancy category C during the first trimester. Based on human data, trandolapril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if trandolapril is excreted in breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Trandolapril in Pregnancy & Lactation

Adverse Reactions **Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with CHF. However, the frequency of adverse effects associated with placebo is also increased in this population.

>1%:

Cardiovascular: Hypotension (<1% to 11%), bradycardia (<1% to 4.7%), intermittent claudication (3.8%), stroke (3.3%), syncope (5.9%)

Central nervous system: Dizziness (1.3% to 23%), asthenia (3.3%)

Endocrine & metabolic: Uric acid increased (15%), hyperkalemia (5.3%), hypocalcemia (4.7%)

Gastrointestinal: Dyspepsia (6.4%), gastritis (4.2%)

Neuromuscular & skeletal: Myalgia (4.7%)

Renal: BUN increased (9%), serum creatinine increased (1.1% to 4.7%)

Respiratory: Cough (1.9% to 35%)

<1% (Limited to important or life-threatening): Chest pain, AV block (first-degree), edema, flushing, palpitation, drowsiness, insomnia, paresthesia, vertigo, pruritus, rash, pemphigus, epistaxis, pharyngitis, upper respiratory tract infection, anxiety, impotence, decreased libido, abdominal distension, abdominal pain, constipation, dyspepsia, diarrhea, vomiting, pancreatitis, leukopenia, neutropenia, thrombocytopenia, increased ALT, muscle pain, gout, dyspnea, angioedema, laryngeal edema, symptomatic hypotension, transaminases elevation, increased bilirubin. Worsening of renal function may occur in patients with bilateral renal artery stenosis or in hypovolemic patients. In addition, a syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia and positive ANA, and elevated ESR has been reported with ACE inhibitors.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may impact fluid balance or cardiac status). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypovolemia, angioedema, postural hypotension) with first doses and on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not discontinue without consulting prescriber. Do not take antacids within 2 hours of this medication. Take first dose at bedtime. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); or diarrhea (buttermilk, boiled milk, yogurt may help). Report immediately any swelling of face, mouth, lips, tongue or throat. Report chest pain or palpitations; swelling of extremities, mouth, or tongue; skin rash; respiratory difficulty or unusual cough; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2 mg, 4 mg

Mavik®: 1 mg, 2 mg, 4 mg

Generic AvailableYes

ManufacturerKnoll Pharmaceutical Company

Pricing: U.S. (www.drugstore.com)

Tablets (Mavik)

1 mg (100): $124.62

2 mg (30): $44.28

4 mg (30): $43.99

Tablets (Trandolapril)

2 mg (100): $110.98

4 mg (100): $111.99

Mechanism of ActionTrandolapril is an ACE inhibitor which prevents the formation of angiotensin II from angiotensin I. Trandolapril must undergo enzymatic hydrolysis, mainly in liver, to its biologically active metabolite, trandolaprilat. A CNS mechanism may also be involved in the hypotensive effect as angiotensin II increases adrenergic outflow from the CNS. Vasoactive kallikrein's may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure.

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Peak effect: Reduction in blood pressure: 6 hours

Duration: Prolonged; 72 hours after single dose

Absorption: Rapid

Distribution:

Trandolapril: ~18L

Trandolaprilat (active metabolite) is very lipophilic in comparison to other ACE inhibitors

Protein binding: 80%

Metabolism: Hepatically hydrolyzed to active metabolite, trandolaprilat

Bioavailability:

Trandolapril: 10%

Trandolaprilat: 70%

Half-life elimination:

Trandolapril: 6 hours; Trandolaprilat: Effective: 10 hours, Terminal: 24 hours

Time to peak: Parent: 1 hour; Active metabolite trandolaprilat: 4-10 hours

Excretion: Urine (33%); feces (66%)

Clearance: Reduce dose in renal failure; creatinine clearances ≤30 mL/minute result in accumulation of active metabolite

Related Information

- Angiotensin Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, nervousness, or insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels; concurrent use with low potency antipsychotics and TCAs may produce additive hypotensive effects

Cardiovascular Considerations

Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Medication Safety Issues

Sound-alike/look-alike issues:

Cyklokapron® may be confused with cycloSPORINE

Pronunciation(tran eks AM ik AS id)
U.S. Brand NamesCyklokapron®
Canadian Brand NamesCyklokapron®; Tranexamic Acid Injection BP
Pharmacologic CategoryAntihemophilic Agent
Use: Labeled IndicationsShort-term use (2-8 days) in hemophilia patients during and following tooth extraction to reduce or prevent hemorrhage
Use: Unlabeled/InvestigationalHas been used as an alternative to aminocaproic acid for subarachnoid hemorrhage
Dosing: Adults**Hemophilia patients, during and following tooth extraction:** I.V.: 10 mg/kg immediately before surgery, then 25 mg/kg/dose orally 3-4 times/day for 2-8 days

Alternatively:

Oral: 25 mg/kg 3-4 times/day beginning 1 day prior to surgery

I.V.: 10 mg/kg 3-4 times/day in patients who are unable to take oral

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren: Refer to adult dosing (limited data in connection with tooth extraction).
Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer 50% of normal dose or 10 mg/kg twice daily I.V. or 15 mg/kg twice daily orally.

Cl_{cr} 10-50 mL/minute: Administer 25% of normal dose or 10 mg/kg/day I.V. or 15 mg/kg/day orally.

Cl_{cr} <10 mL/minute: Administer 10% of normal dose or 10 mg/kg/dose every 48 hours I.V. or 15 mg/kg/dose every 48 hours orally.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.May be given by direct I.V. injection at a maximum rate of 100 mg/minute; compatible with dextrose, saline, and electrolyte solutions; use plastic syringe only for I.V. push
CompatibilityStable in dextrose, saline, electrolyte solutions; **incompatible** with solutions containing penicillin.
ContraindicationsAcquired defective color vision; active intravascular clotting; subarachnoid hemorrhage; concurrent factor IX complex or anti-inhibitor coagulant concentrates
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease.
- Renal impairment: Use with caution in patients with renal impairment; dosage modification required.
- Subarachnoid hemorrhage: When used for subarachnoid hemorrhage, ischemic complications may occur.
- Thromboembolic disease: Use with caution in patients with thromboembolic disease; may increase risk of thrombosis.

Other warnings/precautions:

- Eye exams: Ophthalmic exam before and during therapy required if patient is treated beyond several days.

Pregnancy Risk FactorB
LactationEnters breast milk/use caution
Adverse Reactions

>10%: Gastrointestinal: Diarrhea, nausea, vomiting

1% to 10%:

Cardiovascular: Hypotension, thrombosis

Ocular: Blurred vision

<1%: Unusual menstrual discomfort

Postmarketing and/or case reports: Deep venous thrombosis (DVT), pulmonary embolus (PE), renal cortical necrosis, retinal artery obstruction, retinal vein obstruction, ureteral obstruction

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Anti-inhibitor Coagulant Complex: Antifibrinolytic Agents may enhance the thrombogenic effect of Anti-inhibitor Coagulant Complex. *Risk D: Consider therapy modification*

Fibrinogen Concentrate (Human): Antifibrinolytic Agents may enhance the adverse/toxic effect of Fibrinogen Concentrate (Human). Specifically, the risk for thrombosis may be increased. Fibrinogen Concentrate (Human) may enhance the adverse/toxic effect of Antifibrinolytic Agents. Specifically, the risk for thrombosis may be increased. *Risk C: Monitor therapy*

Reference Range5-10 mcg/mL is required to decrease fibrinolysis

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 100 mg/mL (10 mL)

Tablet: 500 mg [Not marketed in U.S.; available from manufacturer for select cases]

Generic AvailableNo

Mechanism of ActionForms a reversible complex that displaces plasminogen from fibrin resulting in inhibition of fibrinolysis; it also inhibits the proteolytic activity of plasmin

Pharmacodynamics/Kinetics

Half-life elimination: 2-10 hours

Excretion: Urine (>90% as unchanged drug)

Dental Health Professional ConsiderationsAntifibrinolytic drugs are useful for the control of bleeding after dental extractions in patients with hemophilia because the oral mucosa and saliva are rich in plasminogen activators.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(tran il SIP roe meen)

U.S. Brand NamesParnate®

Canadian Brand NamesParnate®

Pharmacologic CategoryAntidepressant, Monoamine Oxidase Inhibitor

Use: Labeled IndicationsTreatment of major depressive episode without melancholia

Use: Unlabeled/InvestigationalPost-traumatic stress disorder

Dosing: Adults**Depression:** Oral: 10 mg twice daily, increase by 10 mg increments at 1- to 3-week intervals; maximum: 60 mg/day; usual effective dose: 30 mg/day

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsAvoid foods containing tryptophan and caffeine. Avoid tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to tranylcypromine, other MAO inhibitors, dibenzazepine derivatives, or any component of the formulation; cardiovascular disease; cerebrovascular defect; headache history; hepatic disease; hypertension; pheochromocytoma; renal disease; concurrent use of antihistamines, antiparkinson drugs, antihypertensives, bupropion, buspirone, CNS depressants, dexfenfluramine, dextromethorphan, diuretics, ethanol, meperidine, and SSRIs; general anesthesia (discontinue 10 days prior to elective surgery); local vasoconstrictors; spinal anesthesia (hypotension may be exaggerated); sympathomimetics (and related compounds); foods high in tyramine content; supplements containing tyrosine, phenylalanine, tryptophan, or caffeine

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription.**Tranylcypromine is not FDA approved for treatment of children and adolescents.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Tranylcypromine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Hypertensive crisis: May occur with foods/supplements high in tyramine, tryptophan, phenylalanine, or tyrosine content; treatment with phentolamine is recommended for hypertensive crisis.

- Orthostatic hypotension: May cause orthostatic hypotension (especially at dosages >30 mg/day); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; sensitization to the effects of insulin may occur, monitor blood glucose closely.

- Glaucoma: Use with caution in patients with glaucoma.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism.

Concurrent drug therapy issues:

- High potential for interactions: Do not use with other MAO inhibitors or antidepressants. Avoid products containing sympathomimetic stimulants or dextromethorphan. Concurrent use with antihypertensive agents may lead to exaggeration of hypotensive effects.

Special populations:

- Elderly: The MAO inhibitors are effective and generally well tolerated by older patients. It is the potential interactions with tyramine or tryptophan-containing foods and other drugs, and their effects on blood pressure that have limited their use.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Myelography: Discontinue at least 48 hours prior to myelography.

Geriatric ConsiderationsMAO inhibitors are effective and generally well tolerated by older patients. Potential interactions with tyramine- or tryptophan-containing foods, other drugs, and adverse effects on blood pressure have limited use of MAO inhibitors. They are usually reserved for patients who do not tolerate or respond to traditional “cyclic” or “second generation” antidepressants. Tranylcypromine is the preferred MAO inhibitor because its enzymatic-blocking effects are more rapidly reversed. The brain activity of monoamine oxidase increases with age and even more so in patients with Alzheimer's disease. Therefore, MAO inhibitors may have an increased role in treating depressed patients with Alzheimer's disease.

Pregnancy Risk FactorC

LactationEnters breast milk/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, orthostatic hypotension, palpitation, tachycardia

Central nervous system: Agitation, akinesia, anxiety, ataxia, chills, confusion, disorientation, dizziness, drowsiness, fatigue, headache, hyperreflexia, insomnia, mania, memory loss, restlessness, sleep disturbances, twitching

Dermatologic: Alopecia, cystic acne (flare), pruritus, rash, urticaria, scleroderma (localized)

Endocrine & metabolic: Hypernatremia, hypermetabolic syndrome; sexual dysfunction (anorgasmia, ejaculatory disturbances, impotence); SIADH

Gastrointestinal: Abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting, weight gain, xerostomia

Genitourinary: Incontinence, urinary retention

Hematologic: Agranulocytosis, anemia, leukopenia, thrombocytopenia

Hepatic: Hepatitis

Neuromuscular & skeletal: Akinesis, muscle spasm, myoclonus, numbness, paresthesia, tremor, weakness

Ocular: Blurred vision, glaucoma

Otic: Tinnitus

Miscellaneous: Diaphoresis

Metabolism/Transport Effects**Inhibits** CYP1A2 (moderate), 2A6 (strong), 2C8 (weak), 2C9 (weak), 2C19 (moderate), 2D6 (moderate), 2E1 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inhibitors (Strong) may decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake

Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (based on CNS depressant effects and potential tyramine content)

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceuticals: Avoid valerian, St John's wort, SAMe. Avoid supplements containing caffeine, gingko, yohimbime, ephedra, tyrosine, tryptophan or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring ParametersBlood pressure, mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Evaluate need for continued therapy on a regular basis. Assess results of laboratory tests, therapeutic effectiveness according to rationale for therapy, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor blood pressure. Monitor for CNS depression. Observe for clinical worsening, suicidality, or unusual behavior changes, especially during the initial few months of therapy or during dosage changes. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsBlood glucose

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Take in the morning to reduce the incidence of insomnia. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Avoid tyramine-containing foods (eg, aged or matured cheese, air-dried or cured meats [including sausages and salamis], fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments); see prescriber for complete list of foods to be avoided. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, monitor blood glucose closely at the beginning of therapy. May cause hypoglycemia. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); or orthostatic hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); or altered sexual ability (reversible). Report persistent excessive sedation; muscle cramping, tremors, weakness, or change in gait; chest pain, palpitations, rapid heartbeat, or swelling of extremities; vision changes; suicidal ideation; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10 mg

Generic AvailableNo

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Parnate)

10 mg (60): $86.45

Mechanism of ActionTranylcypromine is a nonhydrazine monoamine oxidase inhibitor. It increases endogenous concentrations of epinephrine, norepinephrine, dopamine, and serotonin through inhibition of the enzyme (monoamine oxidase) responsible for the breakdown of these neurotransmitters.

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: 2 days to 3 weeks continued dosing

Half-life elimination: 90-190 minutes

Time to peak, serum: ~2 hours

Excretion: Urine

Related Information

- Antidepressant Agents
- Teratogenic Risks of Psychotropic Medications
- Tyramine Content of Foods

Pharmacotherapy PearlsTranylcypromine has a more rapid onset of therapeutic effect than other MAO inhibitors, but causes more severe hypertensive reactions.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension. Avoid use as an analgesic due to toxic reactions with MAO inhibitors. Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAttempts should be made to avoid use of vasoconstrictor due to possibility of hypertensive episodes with monoamine oxidase inhibitors

Mental Health CommentNot commonly used due to a required low tyramine diet and drug-drug interactions. It is estimated that 20 mg of tranylcypromine = 40 mg of isocarboxazid = 45 mg phenelzine. Phenelzine and isocarboxazid are hydrazine MAO inhibitors and tranylcypromine is a nonhydrazine. These drugs produce irreversible inhibition of MAO inhibitors. The half-life for regeneration is 2-3 days. Therefore, a 2-week period is required when switching from an MAO inhibitor to another antidepressant.

While hypertension and hypertensive crisis are risks associated with MAO inhibitor therapy, orthostatic hypotension may also occur. Orthostasis associated with MAO inhibitor therapy is not related to alpha$_1$-adrenergic receptor blockade. The “false transmitter” concept is used to explain this side effect. This concept states that MAO inhibitors promote gradual accumulation in sympathetic nerve ending of amines lacking direct sympathomimetic activity (octopamine) at the expense of the normal synaptic transmitter, norepinephrine. Since octopamine has little ability to activate either alpha- or beta-adrenergic receptors, a functional impairment of sympathetic neurotransmission occurs.

The MAO inhibitors are usually reserved for patients who do not tolerate or respond to other antidepressants. The brain activity of monoamine oxidase increases with age and even more so in patients with Alzheimer's disease. Therefore, the MAO inhibitors may have an increased role in patients with Alzheimer's disease who are depressed. Phenelzine is less stimulating than tranylcypromine.

Index TermsTransamine Sulphate; Tranylcypromine Sulfate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(tras TU zoo mab)

U.S. Brand NamesHerceptin®

Canadian Brand NamesHerceptin®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Monoclonal Antibody

Use: Labeled IndicationsAdjuvant treatment of HER-2 overexpressing breast cancer; treatment of HER-2 overexpressing metastatic breast cancer

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted.

Adjuvant treatment of breast cancer: I.V. infusion:

With concurrent paclitaxel or docetaxel:

Initial loading dose: 4 mg/kg infused over 90 minutes

Maintenance dose: 2 mg/kg infused over 30 minutes weekly for total of 12 weeks, followed 1 week later (when concurrent chemotherapy completed) by 6 mg/kg infused over 30-60 minutes every 3 weeks for total therapy duration of 52 weeks

With concurrent docetaxel/carboplatin:

Initial loading dose: 4 mg/kg infused over 90 minutes

Maintenance dose: 2 mg/kg infused over 30 minutes weekly for total of 18 weeks, followed 1 week later (when concurrent chemotherapy completed) by 6 mg/kg infused over 30-60 minutes every 3 weeks for total therapy duration of 52 weeks

Following completion of anthracycline-based chemotherapy:

Initial loading dose: 8 mg/kg infused over 90 minutes

Maintenance dose: 6 mg/kg infused over 30 minutes every 3 weeks for total therapy duration of 52 weeks

Metastatic breast cancer (either as a single agent or in combination with paclitaxel): I.V. infusion:

Initial loading dose: 4 mg/kg infused over 90 minutes

Maintenance dose: 2 mg/kg infused over 30 minutes weekly until disease progression

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Dosing: Adjustment for Toxicity

Cardiotoxicity: LVEF ≥16% decrease from baseline within normal limits or LVEF below normal limits and ≥10% decrease from baseline: Withhold treatment for 4 weeks and repeat LVEF every 4 weeks. May resume trastuzumab treatment if LVEF returns to normal limits within 4-8 weeks and remains at ≤15% decrease from baseline value. Discontinue permanently for persistent (>8 weeks) LVEF decline or for >3 incidents of treatment interruptions for cardiomyopathy.

Infusion-related events:

Mild-moderate infusion reactions: Decrease infusion rate

Dyspnea, clinically significant hypotension: Interrupt infusion

Severe or life-threatening infusion reactions: Consider permanent discontinuation

Dosing: Combination Regimens

Breast cancer:

Vinorelbine-Trastuzumab-FEC

Administration: I.V.Administered by I.V. infusion; loading doses are infused over 90 minutes; maintenance doses may be infused over 30 minutes if tolerated. Do not administer I.V. push or by rapid bolus. Do not administer with D_5W.

Administration: I.V. DetailObserve patients closely during the infusion for fever, chills, or other infusion-related symptoms. Treatment with acetaminophen, diphenhydramine, and/or meperidine is usually effective for managing infusion-related events.

pH: 6

StoragePrior to reconstitution, store intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Following reconstitution with bacteriostatic SWFI, the solution in the vial is stable refrigerated for 28 days from the date of reconstitution; do not freeze. Solutions reconstituted with sterile water for injection without preservatives must be used immediately. The solution diluted in 250 mL NS for infusion is stable for 24 hours refrigerated; do not freeze.

ReconstitutionReconstitute each vial with 20 mL of bacteriostatic sterile water for injection to a concentration of 21 mg/mL. Swirl gently; do not shake. Allow vial to rest for ~5 minutes. If the patient has a known hypersensitivity to benzyl alcohol, trastuzumab may be reconstituted with sterile water for injection without preservatives, which must be used immediately. Determine the appropriate volume for the trastuzumab dose and further dilute in 250 mL NS prior to administration. Avoid rapid expulsion from syringe; gently invert bag to mix

Compatibility Stable in NS; **incompatible** with D_5W.

ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.

Warnings/Precautions

Boxed warnings:

- Cardiac toxicity: See “Concerns related to adverse effects” below.
- Infusion reactions: See “Concerns related to adverse effects” below.
- Pulmonary toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cardiomyopathy: **[U.S. Boxed Warning]: Trastuzumab is associated with symptomatic and asymptomatic reductions in left ventricular ejection fraction (LVEF) and severe heart failure (HF) and may result in mural thrombus formation and stroke, and even cardiac death; discontinue for cardiomyopathy.** Evaluate LVEF in all patients prior to and during treatments. Extreme caution should be used in patients with pre-existing cardiac disease or dysfunction. Concomitant administration of anthracyclines and prior exposure to anthracyclines or radiation therapy significantly increases the risk of cardiomyopathy; other potential risk factors include advanced age, high or low body mass index, smoking, diabetes, and hyper/hypothyroidism. Discontinuation should be strongly considered in patients who develop a clinically significant reduction in LVEF during therapy; treatment with HF medications (eg, ACE inhibitors, beta-blockers) should be initiated. Cardiomyopathy due to trastuzumab is generally reversible over a period of 1-3 months after discontinuation. (When LVEF returns to baseline, reinitiation may be considered if indicated.) Trastuzumab is also associated with arrhythmias and hypertension.

- Infusion reactions: **[U.S. Boxed Warning]: Infusion reactions (including fatalities) have been associated with use; discontinue for anaphylaxis or angioedema.** Most reactions occur during or within 24 hours of the first infusion; interrupt infusion for dyspnea or significant hypotension. Retreatment of patients who experienced severe hypersensitivity reactions has been attempted (with premedication). Some patients tolerated retreatment, while others experienced a second severe reaction.

- Pulmonary toxicity: **[U.S. Boxed Warning]: May cause serious pulmonary toxicity (dyspnea, hypoxia, interstitial pneumonitis, pulmonary infiltrates, pleural effusion, noncardiogenic pulmonary edema, pulmonary insufficiency, acute respiratory distress syndrome [ARDS], and/or pulmonary fibrosis); discontinue for ARDS or interstitial pneumonitis.** Use caution in patients with pre-existing pulmonary disease or patients with extensive pulmonary tumor involvement; these patient populations may have more severe toxicity. Pulmonary events may occur during or within 24 hours of administration; delayed reactions have occurred.

Concurrent drug therapy issues:

- Chemotherapy: When used in combination with myelosuppressive chemotherapy, trastuzumab may increase the incidence of neutropenia (moderate-to-severe) and febrile neutropenia.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsReproductive studies in cynomolgus monkeys showed no evidence of impaired fertility or fetal harm. Trastuzumab inhibits HER2 protein, which has a role in embryonic development. Anhydramnios and oligohydramnios (reversible in some cases) have been reported with use during the second and third trimester of pregnancy. There are no adequate and well-controlled studies in pregnant women. Effective contraception is recommended during and for 6 months after treatment for women of childbearing potential. If used during pregnancy, monitor for oligohydramnios. Women exposed to trastuzumab during pregnancy are encouraged to enroll in the Cancer and Childbirth Registry (1-800-690-6720).

The National Comprehensive Cancer Network (NCCN) breast cancer guidelines (v2.2008) recommend administering trastuzumab in the postpartum period (if trastuzumab is indicated).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether trastuzumab is secreted in human milk. Because many immunoglobulins are secreted in milk, and the potential for serious adverse reactions in the nursing infant exists, patients should discontinue nursing during treatment; the extended half-life should be considered for decisions regarding breast-feeding after therapy completion.

Adverse Reactions**Note:** Percentages reported with single-agent therapy.

>10%:

Cardiovascular: LVEF decreased (4% to 22%)

Central nervous system: Pain (47%), fever (6% to 36%), chills (5% to 32%), headache (10% to 26%), insomnia (14%), dizziness (4% to 13%)

Dermatologic: Rash (4% to 18%)

Gastrointestinal: Nausea (6% to 33%), diarrhea (7% to 25%), vomiting (4% to 23%), abdominal pain (2% to 22%), anorexia (14%)

Neuromuscular & skeletal: Weakness (4% to 42%), back pain (5% to 22%)

Respiratory: Cough (5% to 26%), dyspnea (3% to 22%), rhinitis (2% to 14%), pharyngitis (12%)

Miscellaneous: Infusion reaction (21% to 40%, chills and fever most common; severe: 1%), infection (20%)

1% to 10%:

Cardiovascular: Peripheral edema (5% to 10%), edema (8%), CHF (2% to 7%; severe: <1%), tachycardia (5%), hypertension (4%), arrhythmia (3%), palpitation (3%)

Central nervous system: Depression (6%)

Dermatologic: Acne (2%), nail disorder (2%), pruritus (2%)

Gastrointestinal: Constipation (2%), dyspepsia (2%)

Genitourinary: Urinary tract infection (3% to 5%)

Hematologic: Anemia (4%), leukopenia (3%)

Neuromuscular & skeletal: Paresthesia (2% to 9%), bone pain (3% to 7%), arthralgia (6% to 8%), myalgia (4%), muscle spasm (3%), peripheral neuritis (2%), neuropathy (1%)

Respiratory: Sinusitis (2% to 9%), nasopharyngitis (8%), upper respiratory infection (3%), epistaxis (2%), pharyngolaryngeal pain (2%)

Miscellaneous: Flu-like syndrome (2% to 10%), accidental injury (6%), influenza (4%), allergic reaction (3%), herpes simplex (2%)

<1%, postmarketing, and/or case reports: Acute respiratory distress syndrome (ARDS), amblyopia, anaphylaxis, anaphylactoid reaction, angioedema, apnea, ascites, asthma, ataxia, bone necrosis, bronchospasm, cardiac arrest, cardiomyopathy, cellulitis, coagulopathy, colitis, confusion, deafness, esophageal ulcer, gastroenteritis, glomerulonephritis (membraneous, focal and fibrillary), glomerulopathy, glomerulosclerosis, hematemesis, hemorrhage, hemorrhagic cystitis, hepatic failure, hepatitis, herpes zoster, hydrocephalus, hydronephrosis, hypercalcemia, hypersensitivity, hypotension, hypothyroidism, hypoxia, ileus, intestinal obstruction, interstitial pneumonitis, laryngitis, leukemia (acute), lymphangitis, mania, mural thrombosis, myopathy, nephrotic syndrome, neutropenia, pancreatitis, pancytopenia, paroxysmal nocturnal dyspnea, pathological fracture, pericardial effusion, pleural effusion, pneumonitis, pneumothorax, pulmonary edema (noncardiogenic), pulmonary fibrosis, pulmonary hypertension, pulmonary infiltrate, pyelonephritis, radiation injury, renal failure, respiratory distress, respiratory failure, seizure, sepsis, shock, skin ulcers, stroke, syncope, stomatitis, thyroiditis (autoimmune), vascular thrombosis, ventricular dysfunction, volume overload

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Antineoplastic Agents (Anthracycline): Trastuzumab may enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Immunosuppressants: Trastuzumab may enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Paclitaxel: Trastuzumab may decrease the serum concentration of Paclitaxel. Paclitaxel may increase the serum concentration of Trastuzumab.
Risk C: Monitor therapy

Monitoring ParametersHER2 expression assessment (pretherapy); monitor vital signs during infusion; signs and symptoms of cardiac dysfunction; LVEF (baseline, every 3 months during treatment, upon therapy completion and every 6 months for at least 2 years; if treatment is withheld for significant LVEF dysfunction, monitor LVEF at 4-week intervals)

Nursing: Physical Assessment/MonitoringMonitor therapeutic effectiveness and adverse reactions. Monitor vital signs during infusion. Assess knowledge/teach patient interventions to reduce side effects and adverse symptoms to report.

Patient EducationThis medication can only be administered by infusion. Report immediately any adverse reactions during infusion (eg, respiratory difficulty, chills, fever, headache, backache, or nausea/vomiting) so appropriate medication can be administered. You will be susceptible to infection (avoid crowds and exposure to infection). You may experience dizziness or weakness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (boiled milk, yogurt, or buttermilk may help); or headache, back or joint pain (mild analgesics may offer relief). Report persistent GI effects; sore throat, runny nose, or respiratory difficulty; chest pain, irregular heartbeat, palpitations, swelling of extremities, or unusual weight gain; muscle or joint weakness, numbness, or pain; skin rash or irritation; itching or pain on urination; unhealed sores, white plaques in mouth or genital area, unusual bruising or bleeding; or other unusual adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Herceptin®: 440 mg [packaged with bacteriostatic water for injection; diluent contains benzyl alcohol]

Generic AvailableNo

ManufacturerGenentech, Inc

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Herceptin)

440 mg (1): $2899.82

Mechanism of ActionTrastuzumab is a monoclonal antibody which binds to the extracellular domain of the human epidermal growth factor receptor 2 protein (HER-2); it mediates antibody-dependent cellular cytotoxicity by inhibiting proliferation of cells which overexpress HER-2 protein.

Pharmacodynamics/Kinetics

Distribution: V_d: 44 mL/kg; not likely to cross the (intact) blood brain barrier (due to the large molecule size)

Half-life elimination: Weekly dosing: Mean: 6 days (range: 1-32 days); every 3 week regimen: Mean: 16 days (range: 11-23 days)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia and dizziness are common; may cause depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsNSC-688097

Travelers' Diarrhea and Cholera Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation

(TRAV uh lerz dahy uh REE uh & KOL er uh vak SEEN)

Canadian Brand NamesDukoral™
Pharmacologic CategoryVaccine
Use: Labeled IndicationsProtection against travelers' diarrhea and/or cholera in adults and children ≥2 years of age who will be visiting areas where there is a risk of contacting travelers' diarrhea caused by enterotoxigenic *E. coli* (ETEC) or cholera caused by *V. cholerae* O1 (classical and El Tor biotypes)
Dosing: Adults

Cholera: Oral:

Primary immunization: 2 doses given at intervals of ≥1 week and completed at least 1 week prior to trip to endemic/epidemic areas; restart treatment if interval between doses >6 weeks

Booster: 1 dose after 2 years have elapsed since vaccination

ETEC: Oral:

Primary immunization: 2 doses given at intervals of ≥1 week; restart treatment if interval between doses >6 weeks

Booster:

Continued risk: 1 dose every 3 months

Renewed protection: 1 dose may be given if last booster or original immunization was <5 years ago (if >5 years, revaccinate)

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Cholera: Oral:

Primary immunization:

Children 2-6 years: 3 doses given at intervals of ≥1 week and completed at least 1 week prior to trip to endemic/epidemic areas; restart treatment if interval between doses >6 weeks

Children ≥6 years: Refer to adult dosing.

Booster:

Children 2-6 years: 1 dose after 6 months have elapsed since vaccination

Children ≥6 years: Refer to adult dosing.

ETEC: Oral: Children ≥2 years: Refer to adult dosing.

Administration: OralFor oral use only; do no administer I.M., I.V., or SubQ. Food should be avoided 1 hour before and 1 hour following vaccine administration. Use reconstituted solution within 2 hours of mixing.
Dietary ConsiderationsFood may affect efficacy of vaccine; avoid 1 hour before and 1 hour following vaccine administration.
StorageReconstituted solution may be stored at room temperature (<27°C) for up to 2 hours. Vial should be stored between 2°C to 8°C (35°F to 46°F), and may be stored at room temperature up to 2 weeks on one occasion only. The sachet may be stored with the vial between 2°C to 8°C (35°F to 46°F) or separately at room temperature (<27°C).
ReconstitutionThe effervescent granules contained in the sachet, should be dissolved in a glass with 150 mL of water resulting in a buffer solution; do not use juice milk or other beverages. For children 2-6 years, half the amount of the buffer solution is poured away. The vial containing the vaccine should be shaken and the entire contents should be added to the buffer solution and mixed. Use reconstituted solution within 2 hours of mixing.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to any component of the formulation; acute illness (excluding minor illnesses such as a mild upper respiratory tract infection)
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Cholera infection: May not protect 100% of susceptible individuals; has not been shown to protect against cholera caused by 0139 Bengal strain in South Asia.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

- Formaldehyde: Product may contain trace amounts of formaldehyde.

- Latex: Packaging may contain natural latex rubber.

Pregnancy ConsiderationsSafety and efficacy in pregnant women have not been established; the vaccine is not recommended for use during pregnancy. However, since the vaccine is given orally in an inactivated form, acts locally in the gut, and does not replicate, it may not (in theory) cause a risk to the fetus. Use should only be considered if the potential benefit to the mother outweighs the potential risk to the fetus.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsThe manufacturer states that the vaccine may be given to lactating women.

Adverse ReactionsAll serious adverse reactions related to the administration of the product should be reported in accordance with local requirements and to the Senior Product Safety Officer, Pharmacovigilance Department, Aventis Pasteur Limited, 1755 Steeles Avenue West, Toronto, ON, M2R2T4, Canada. 1-888-621-1146 (phone) or 416-667-2435 (fax).

>10%: Gastrointestinal: Abdominal pain (16%), diarrhea (12%)

1% to 10%: Gastrointestinal: Vomiting (3%)

Postmarketing and/or case reports: Dizziness, dyspnea, headache

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: May affect efficacy of vaccine. Avoid food 1 hour before and 1 hour following vaccine administration.

Nursing: Physical Assessment/MonitoringAssess any previous exposure to cholera vaccine prior to treatment. Instruct patient about safe eating and drinking practice. Teach patient proper use (how to prepare), possible side effects/appropriate interventions, instruct patient about anaphylactic treatment that should be available during use, and adverse symptoms to report.

Patient EducationEmergency treatment for anaphylactic reaction should be available during use (consult prescriber). Granules must be dissolved in a glass with 150 mL of water (do not use juice, milk, or other beverages). Shake small glass vial of vaccine and add vaccine from the vial to the solution in the glass, stir well and drink. Avoid food one hour before or one hour after taking vaccine. May cause mild transient abdominal pain or diarrhea (consult prescriber if necessary). Report immediately any serious adverse reactions.

Safe eating and drinking tips for travelers: Drink only bottled water, soft drinks, or fruit juices, alcoholic beverages without ice, and only pasteurized and properly refrigerated milk; only fruits and vegetables that are freshly peeled or freshly cooked, foods that are well cooked and served hot. Avoid tap water (even when brushing teeth) and ice cubes, fruits that don't need peeling, uncooked vegetables or salads, uncooked or undercooked meat, fish or shellfish, foods sold by street vendors.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Suspension [vial]:

Dukoral™ [CAN]: 2.5 x 10^{10} of each of the following *Vibrio cholerae* O1 strains: Inaba classic (heat inactived), Inaba El Tor (formalin inactivated), Ogawa classic (heat inactivated), Ogawa classic (formalin inactivated), and 1 mg recombinant cholera toxin B subunit (rCTB) (3 mL) [may contain trace amounts of formaldehyde; packaged with sachet containing 5.6 g sodium hydrogen carbonate (contains saccharin, raspberry flavor)] [not available in the U.S.]

ManufacturerSBL Vaccin AB

Pharmacodynamics/KineticsOnset of ETEC diarrhea and cholera immunity: 1 week after primary immunization is concluded

Pharmacotherapy PearlsDukoral™ may be administered to HIV-infected persons.

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

DuoTrav™ may be confused with DuoNeb®

Pronunciation(TRA voe prost & TIM oh lol)

Canadian Brand NamesDuoTrav™

Pharmacologic CategoryBeta Blocker, Nonselective; Ophthalmic Agent, Antiglaucoma; Prostaglandin, Ophthalmic

Use: Labeled IndicationsReduction of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension who are insufficiently responsive to topical beta-blockers, prostaglandin analogues, or other IOP-reducing agents and in whom combination therapy is appropriate

Dosing: Adults**Control of intraocular pressure:** Ophthalmic: Instill 1 drop into affected eye(s) once daily in the morning

Dosing: ElderlyRefer to adult dosing.

Administration: OtherRemove contact lenses prior to administration; wait 15 minutes before reinserting if using products containing benzalkonium chloride. Separate administration of other ophthalmic agents by 5 minutes.

StorageStore between 2°C to 25°C (36°F to 77°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to travoprost, timolol, or any other component of the formulation; current or history of bronchial asthma, severe chronic obstructive pulmonary disease (COPD); sinus bradycardia, second- or third-degree atrioventricular block, overt cardiac failure, cardiogenic shock. Also see individual agents.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Ocular effects: Use of agents that reduce/suppress aqueous humor production has been associated with choroidal detachment after filtration procedures. Discontinue use in patients with chronic or recurrent choroidal detachment. Macular edema, mainly in aphakic or pseudophakic patients with a torn posterior lens capsule, has been associated with use of prostaglandin analogues such as travoprost. May permanently change/increase brown pigmentation of the iris, the eyelid skin, and eyelashes. In addition, may increase the length and/or number of eyelashes (may vary between eyes); changes occur slowly and may not be noticeable for months or years. Long-term consequences and potential injury to eye are not known.

Disease-related concerns:

- Angle-closure glaucoma: Not for use alone to treat acute angle-closure glaucoma.
- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormalities: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure: Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Iritis/uveitis: Use caution in patients with active intraocular inflammation.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may worsen disease or other myasthenic symptoms (diplopia, ptosis).
- Orthostatic hypotension: Use with caution in patients with orthostatic hypotension; signs and symptoms of hypotension may be enhanced.
- Renal Impairment: Safety and efficacy have not been established in renal impairment.
- Thyrotoxicosis: Signs of hyperthyroidism (eg, tachycardia) may be masked by beta-blockers. Avoid abrupt withdrawal if thyrotoxicosis is suspected (may precipitate thyroid storm).
- Vascular disease: Use caution in patients with cerebral/coronary vascular insufficiency.

Special populations:

- Contact lens wearers: Product contains benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Absorption: Systemic absorption and adverse effects may occur with ophthalmic use, including bradycardia and/or hypotension. Beta-blocker therapy should not be withdrawn abruptly in order to avoid acute tachycardia, hypertension, and/or ischemia. . Patients undergoing major surgery should be gradually tapered off therapy prior to procedure.

- Initial therapy: DuoTrav™ should not be used for initial therapy.

Also see individual agents.

Pregnancy ConsiderationsReproductive studies have not been conducted with this combination. See individual agents.
LactationEnters breast milk (timolol)/not recommended
Breast-Feeding ConsiderationsTimolol has been detected in human breast milk following ophthalmic administration. It is not known if travoprost is excreted in human milk. See individual agents.
Adverse ReactionsAlso see individual agents. Based on long-term studies:

>10%: Ocular: Hyperemia (14%)

1% to 10%: Ocular: Eye irritant (6%), eye pruritus (5%), dry eyes (3%), eyelash growth (2%), iris pigmentation changes (up to 2%), blurred vision (1%), eye pain (1%), photophobia (1%), punctuate keratitis (1%)

<1%: Allergic conjunctivitis, anterior chamber flare, arrhythmia, asthenopia, blepharitis, bradycardia, bronchospasm, chromaturia, conjunctival hemorrhage, contact dermatitis, cough, corneal staining, distichiasis, dizziness, dyspnea, extremity pain, eye allergy, eyelid dermatitis, eyelid edema, eyelid erythema, eyelid irritation, eyelid pain, eye swelling, headache, hyper-/hypotension, hypertrichosis, lacrimation increased, nervousness, ocular discomfort, periorbital disorder, postnasal drip, skin hyperpigmentation, thirst, throat irritation, urticaria, visual disturbance, xerophthalmia

Metabolism/Transport EffectsTimolol: **Substrate** of CYP2D6 (major); **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersIOP, iris color changes, eyelash changes; systemic effects of beta blockade with ophthalmic administration

Nursing: Physical Assessment/Monitoring

See individual agents.

Patient Education

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Solution, ophthalmic:

DuoTrav™ [CAN]: Travoprost 0.004% and timolol 0.5%: (2.5 mL, 5 mL) [contains benzalkonium chloride] [not available in the U.S.]

Generic AvailableNo

ManufacturerAlcon Canada, Inc

Mechanism of Action

Travoprost: Selective FP prostanoid receptor agonist which lowers intraocular pressure by increasing trabecular meshwork and outflow

Timolol: Blocks both beta$_1$- and beta$_2$-adrenergic receptors, reduces intraocular pressure by reducing aqueous humor production or possibly outflow; reduces blood pressure by blocking adrenergic receptors and decreasing sympathetic outflow, produces a negative chronotropic and inotropic activity through an unknown mechanism

Pharmacodynamics/KineticsSee individual agents.

Mental Health: Effects on Mental StatusMay cause CNS depression; use with caution

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTimolol Maleate and Travoprost

Medication Safety Issues

Sound-alike/look-alike issues:

Travatan® may be confused with Xalatan®

Pronunciation(TRA voe prost)

U.S. Brand NamesTravatan®; Travatan® Z

Canadian Brand NamesTravatan®; Travatan® Z

Pharmacologic CategoryOphthalmic Agent, Antiglaucoma; Prostaglandin, Ophthalmic

Use: Labeled IndicationsReduction of elevated intraocular pressure in patients with open-angle glaucoma or ocular hypertension who are intolerant of the other IOP-lowering medications or insufficiently responsive (failed to achieve target IOP determined after multiple measurements over time) to another IOP-lowering medication

Dosing: Adults**Glaucoma (open angle) or ocular hypertension:** Ophthalmic: Instill 1 drop into affected eye(s) once daily in the evening; do not exceed once-daily dosing (may decrease IOP-lowering effect). If used with other topical ophthalmic agents, separate administration by at least 5 minutes.

Dosing: ElderlyRefer to adult dosing.

Administration: OtherMay be used with other eye drops to lower intraocular pressure. If using more than one ophthalmic product, wait at least 5 minutes in between application of each medication. Travatan®: Remove contact lenses prior to administration and wait 15 minutes before reinserting.

StorageStore between 2°C to 25°C (36°F to 77°F).

ContraindicationsHypersensitivity to travoprost or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions, has caused bacterial keratitis.
- Ocular effects: May permanently change/increase brown pigmentation of the iris, the eyelid skin, and eyelashes. In addition, may increase the length and/or number of eyelashes (may vary between eyes); changes occur slowly and may not be noticeable for months or years. Long-term consequences and potential injury to eye are not known.

Disease-related concerns:

- Ocular disease: Use with caution in patients with intraocular inflammation, aphakic patients, pseudophakic patients with a torn posterior lens capsule, or patients with risk factors for macular edema. Safety and efficacy have not been determined for use in patients with angle-closure-, inflammatory-, or neovascular glaucoma.

Special populations:

- Contact lens wearers: Travatan® contains benzalkonium chloride which may be adsorbed by contact lenses; remove lens prior to administration and wait 15 minutes before re-inserting.
- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Contact with contents of vial should be avoided in women who are pregnant or attempting to become pregnant; in case of accidental exposure to the skin, wash the exposed area with soap and water immediately.

Geriatric ConsiderationsEvaluate patient's ability to self-administer eye drops.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies following systemic administration.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Ocular: Hyperemia (35% to 50%)

5% to 10%: Ocular: Decreased visual acuity, eye discomfort, foreign body sensation, pain, pruritus

1% to 5%:

Cardiovascular: Angina pectoris, bradycardia, hyper-/hypotension

Central nervous system: Depression, pain, anxiety, headache

Endocrine & metabolic: Hypercholesterolemia

Gastrointestinal: Dyspepsia

Genitourinary: Prostate disorder, urinary incontinence

Neuromuscular & skeletal: Arthritis, back pain, chest pain

Ocular (1% to 4%): Abnormal vision, blepharitis, blurred vision, conjunctivitis, dry eye, iris discoloration, keratitis, lid margin crusting, photophobia, subconjunctival hemorrhage, cataract, tearing, periorbital skin discoloration (darkening), eyelash darkening, eyelash growth increased

Respiratory: Bronchitis, sinusitis

Postmarketing and/or case reports: Bacterial keratitis (due to solution contamination)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor patient response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient EducationFor use in eyes only. Wash hands before instilling. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution. Apply gentle pressure to inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Contact prescriber concerning continued use of drops if eye infection develops, trauma occurs to the eye, and prior to eye surgery. Travatan® contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting. May cause permanent changes in eye color (increases the amount of brown pigment in the iris), eyelid, and eyelashes. May also increase the length and/or number of eyelashes. Changes may occur slowly (months to years). May be used with other eye drops to lower intraocular pressure. If using more than one eye drop medicine, wait at least 5 minutes in between application of each medication. Notify prescriber if conjunctivitis or eyelid reactions occur with use of this product. In case of accidental contact with the solution, wash skin with soap and water immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic:

Travatan®: 0.004% (2.5 mL, 5 mL) [contains benzalkonium chloride]

Travatan® Z: 0.004% (2.5 mL, 5 mL)

Generic AvailableNo

ManufacturerAlcon Laboratories, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Travatan)

0.004% (2.5): $73.87

0.004% (5): $144.74

Solution (Travatan Z)

0.004% (2.5): $73.99

0.004% (5): $144.53

Mechanism of ActionA selective FP prostanoid receptor agonist which lowers intraocular pressure by increasing trabecular meshwork and outflow

Pharmacodynamics/Kinetics

Onset of action: ~2 hours

Peak effect: 12 hours

Duration: Plasma levels decrease to <10 pg/mL within 1 hour

Absorption: Absorbed via cornea

Metabolism: Hydrolyzed by esterases in the cornea to active free acid; systemically; the free acid is metabolized to inactive metabolites

Related Information

- Glaucoma Drug Therapy

Pharmacotherapy PearlsThe IOP-lowering effect was shown to be 7-8 mm Hg in clinical studies. The mean IOP reduction in African-American patients was up to 1.8 mm Hg greater than in non-African-American patients. The reason for this effect is unknown.

Dental Health: Effects on Dental TreatmentNo information available to require special precautions

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo significant effects or complications reported

Mental Health: Effects on Mental StatusMay cause anxiety and depression

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Desyrel® may be confused with Demerol®, Delsym®, Zestril®

TraZODone may be confused with traMADol

International issues:

Desyrel® may be confused with Deseril® which is a brand name for methysergide in multiple international markets

Pronunciation(TRAZ oh done)

Canadian Brand NamesAlti-Trazodone; Apo-Trazodone D®; Apo-Trazodone®; Desyrel®; Gen-Trazodone; Novo-Trazodone; Nu-Trazodone; PMS-Trazodone; ratio-Trazodone; Trazorel®

Pharmacologic CategoryAntidepressant, Serotonin Reuptake Inhibitor/Antagonist

Use: Labeled IndicationsTreatment of depression

Use: Unlabeled/InvestigationalPotential augmenting agent for antidepressants, hypnotic

Dosing: Adults

Depression: Oral: Initial: 150 mg/day in 3 divided doses (may increase by 50 mg/day every 3-7 days); maximum: 600 mg/day

Note: Therapeutic effects may take up to 6 weeks. Therapy is normally maintained for 6-12 months after optimum response is reached to prevent recurrence of depression.

Sedation/hypnotic (unlabeled use): Oral: 25-50 mg at bedtime (often in combination with daytime SSRIs). May increase up to 200 mg at bedtime.

Dosing: ElderlyOral: 25-50 mg at bedtime with 25-50 mg/day dose increase every 3 days for inpatients and weekly for outpatients, if tolerated; usual dose: 75-150 mg/day

Dosing: Pediatric

Depression (unlabeled use):

Children 6-12 years: Initial: 1.5-2 mg/kg/day in divided doses; increase gradually every 3-4 days as needed; maximum: 6 mg/kg/day in 3 divided doses

Adolescents: Initial: 25-50 mg/day; increase to 100-150 mg/day in divided doses

Administration: OralDosing after meals may decrease lightheadedness and postural hypotension.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to trazodone or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription.**Trazodone is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Trazodone is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Orthostatic hypotension: May cause orthostatic hypotension (risk is high relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is very high relative to other antidepressants.

- Sexual dysfunction: Priapism, including cases resulting in permanent dysfunction, has occurred with the use of trazodone.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is low relative to other antidepressants. Not recommended for use in a patient during the acute recovery phase of MI.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- MAO inhibitors: Trazodone should be initiated with caution in patients who are receiving concurrent or recent therapy with a MAO inhibitor.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsVery sedating, but little anticholinergic effects.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTrazodone is classified as pregnancy category C due to adverse effects observed in animal studies. When trazodone is taken during pregnancy, an increased risk of major malformations has not been observed in the small number of pregnancies studied. The long-term effects on neurobehavior have not been evaluated.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. Therapy during pregnancy should be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester to prevent potential withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery.

LactationEnters breast milk/use caution (AAP rates “of concern”)
Breast-Feeding ConsiderationsTrazodone is excreted into breast milk; breast milk concentrations peak ~2 hours following administration. It is not known if the trazodone metabolite is found in breast milk. The long-term effects on neurobehavior have not been studied. The manufacturer recommends that caution be exercised when administering trazodone to nursing women. The AAP considers trazadone to be a “drug for which the effect on the nursing infant is unknown, but may be of concern."
Pregnancy & Lactation, In-Depth

- TraZODone in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Dizziness, headache, sedation

Gastrointestinal: Nausea, xerostomia

Ocular: Blurred vision

1% to 10%:

Cardiovascular: Syncope, hyper-/hypotension, edema

Central nervous system: Concentration decreased, confusion, fatigue, incoordination

Gastrointestinal: Diarrhea, constipation, weight gain/loss

Neuromuscular & skeletal: Tremor, myalgia

Respiratory: Nasal congestion

<1% (Limited to important and life-threatening): Agitation, allergic reactions, alopecia, anxiety, bradycardia, extrapyramidal symptoms, hepatitis, priapism, rash, seizure, speech impairment, tachycardia, urinary retention

Metabolism/Transport Effects **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (moderate), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Venlafaxine: May enhance the serotonergic effect of TraZODone. This could result in serotonin syndrome. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Time to peak serum levels may be increased if trazodone is taken with food.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersSuicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)
Reference Range

Plasma levels do not always correlate with clinical effectiveness

Therapeutic: 0.5-2.5 mcg/mL

Potentially toxic: >2.5 mcg/mL

Toxic: >4 mcg/mL

Nursing: Physical Assessment/MonitoringAssess potential and monitor closely for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness according to rationale for therapy, and adverse reactions at beginning of therapy and periodically with long-term use. Initiate at lower doses and taper dosage slowly when discontinuing (allow 3-4 weeks between discontinuing Desyrel® and starting another antidepressant). Teach patient appropriate use, side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsBaseline liver function prior to and periodically during therapy
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not increase dose or frequency. It may take 2-4 weeks to achieve desired results. Take after meals. Avoid excessive alcohol and caffeine. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); nausea, dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, yogurt, or boiled milk may help). Report persistent dizziness or headache; muscle cramping, tremors, or altered gait; blurred vision or eye pain; chest pain or irregular heartbeat; suicidal ideation; or worsening of condition. Report prolonged or inappropriate erections. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 50 mg, 100 mg, 150 mg, 300 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Desyrel)

100 mg (30): $103.98

Tablets (Trazodone HCl)

50 mg (30): $11.99

100 mg (30): $13.99

150 mg (30): $20.87

300 mg (100): $402.20

Mechanism of ActionInhibits reuptake of serotonin, causes adrenoreceptor subsensitivity, and induces significant changes in 5-HT presynaptic receptor adrenoreceptors. Trazodone also significantly blocks histamine (H_1) and alpha$_1$-adrenergic receptors.
Pharmacodynamics/Kinetics

Onset of action: Therapeutic (antidepressant): 1-3 weeks; sleep aid: 1-3 hours

Protein binding: 85% to 95%

Metabolism: Hepatic via CYP3A4 to an active metabolite (mCPP)

Half-life elimination: 7-8 hours, two compartment kinetics

Time to peak, serum: 30-100 minutes; delayed with food (up to 2.5 hours)

Excretion: Primarily urine; secondarily feces

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsTrazodone inhibits reuptake of both serotonin and norepinephrine and also blocks some serotonin receptors. No precautions with vasoconstrictors appear to be necessary.
Index TermsTrazodone Hydrochloride

Treprostinil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(tre PROST in il)
U.S. Brand NamesRemodulin®
Canadian Brand NamesRemodulin®
Pharmacologic Category[Prostacyclin](); [Prostaglandin](); [Vasodilator]()
Use: Labeled IndicationsTreatment of pulmonary arterial hypertension (PAH) in patients with NYHA Class II-IV symptoms to decrease exercise-associated symptoms; to diminish clinical deterioration when transitioning from epoprostenol (I.V.)
Dosing: Adults**Note:** Prior to initiation, patients should be carefully evaluated for ability to administer treprostinil and care for the infusion system outside of inpatient setting. Immediate access to back up pump, infusion sets, and medication is essential to prevent treatment interruptions.

Pulmonary arterial hypertension (PAH): SubQ (preferred) or I.V. infusion:

Initial: New to prostacyclin therapy: 1.25 ng/kg/minute continuous; if dose cannot be tolerated due to systemic effects, reduce to 0.625 ng/kg/minute. Increase at rate not >1.25 ng/kg/minute per week for first 4 weeks, and not >2.5 ng/kg/minute per week for remainder of therapy. Limited experience with doses >40 ng/kg/minute. **Note:** Dose must be carefully and individually titrated (symptom improvement with minimal adverse effects). Avoid abrupt withdrawal. If infusion is restarted within a few hours of discontinuation, the same dose rate may be used. Interruptions for longer periods may require retitration.

Transitioning from epoprostenol (see table): SubQ (preferred) or I.V. infusion: **Note:** Transition should occur in a hospital setting to follow response (eg, walking distance, sign/symptoms of disease progression). May take 24-48 hours to transition. Transition is accomplished by initiating the infusion of treprostinil, and increasing it while simultaneously reducing the dose of intravenous epoprostenol. During transition, increases in PAH symptoms should be first treated with an increase in treprostinil dose. Occurrence of prostacyclin associated side effects should be treated by decreasing the dose of epoprostenol.

Transitioning From I.V. Epoprostenol to SubQ (preferred) or I.V. Treprostinil

Step	**Epoprostenol Dose**	**Treprostinil Dose**
1	Maintain current dose	Initiate at 10% initial epoprostenol dose
2	Decrease to 80% initial dose	Increase to 30% initial epoprostenol dose
3	Decrease to 60% initial dose	Increase to 50% initial epoprostenol dose
4	Decrease to 40% initial dose	Increase to 70% initial epoprostenol dose
5	Decrease to 20% initial dose	Increase to 90% initial epoprostenol dose
6	Decrease to 5% initial dose	Increase to 110% initial epoprostenol dose
7	Discontinue epoprostenol	Maintain current dose plus additional 5% to 10% as needed

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricLimited experience in patients <16 years of age.
Dosing: Renal ImpairmentNo specific dosage adjustment recommended; use with caution.
Dosing: Hepatic Impairment

Mild-to-moderate: Initial: 0.625 ng/kg/minute; increase with caution.

Severe: Has not been studied in patients with severe hepatic impairment.

Administration: I.V.I.V. infusion: I.V. use is recommended when SubQ infusion is not tolerated or when the benefit outweighs the potential risks of an indwelling central venous catheter. Prior to initiation, patients should be carefully evaluated for ability to administer treprostinil and care for the infusion system outside of inpatient setting. Solution must be diluted in SWFI or NS prior to use and administered by continuous infusion using a central indwelling catheter and infusion pump. Peripheral infusion may be used temporarily until central line is established. Avoid abrupt withdrawal (including interruptions in delivery) or rapid large dosage reductions. Immediate access to back up pump, infusion sets and medication is essential to prevent treatment interruptions.

Administration: I.V. DetailpH 6-7.2

Administration: OtherSubQ infusion (preferred): Administer undiluted via continuous SubQ infusion using an appropriately-designed infusion pump. Prior to initiation, patients should be carefully evaluated for ability to administer treprostinil and care for the infusion system outside of inpatient setting. Avoid abrupt withdrawal (including interruptions in delivery) or rapid large dosage reductions. Immediate access to back up pump, infusion sets and medication is essential to prevent treatment interruptions. Infusion site reactions may be helped by moving the infusion site every 3 days, local application of topical hot and cold packs, topical or oral analgesics. Injection site pain and erythema may improve after several months of therapy.

Dietary ConsiderationsSodium chloride content of solution for injection:

1 mg/mL, 2.5 mg/mL, and 5 mg/mL each contain sodium chloride 5.3 mg/mL

10 mg/mL contains sodium chloride 4 mg/mL

StorageStore vials at 15°C to 30°C (59°F to 86°F). Contents of a vial should not be used past 30 days after initial needle access into the vial. Stability for up to 48 hours has been shown for concentrations as low as 4000 ng/mL. Solutions diluted for infusion may be used for up to 48 hours at 37°C.

ReconstitutionFor SubQ infusion, **product should not be diluted prior to use**. For I.V. infusion, dilute in SWFI, NS, or Flolan® sterile diluent to a final volume of either 50 mL or 100 mL (dependent on system reservoir and calculated dose).

CompatibilityStable in SWFI, NS, or Flolan® sterile diluent.

ContraindicationsThere are no contraindications listed in the FDA-approved labeling.

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dose reduction is recommended for the initial dose in patients with mild-to-moderate hepatic insufficiency; has not been studied in severe hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment

Special populations:

- Elderly: Use with caution in patients ≥65 years of age; clinical trial experience in this population is limited.

- Pediatrics: Safety and efficacy have not been established in children ≤16 years of age.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt withdrawal/large dosage reductions may worsen symptoms of PAH. If infusion is restarted within a few hours of discontinuation, the same dose rate may be used. Interruptions for longer periods may require retitration.

- Infection: Chronic continuous I.V. infusion of treprostinil via a chronic indwelling central venous catheter has been associated with serious blood stream infections. This method of administration should be reserved for patients who are intolerant of the SubQ route or in whom the benefit outweighs the potential risks. Clinicians should routinely review with patient the importance of infection control practices for the management of a central venous catheter.

- Appropriate use: Treprostinil should only be used by clinicians experienced in the treatment of PAH. Prior to initiation, patients should be carefully evaluated for ability to administer treprostinil and care for the infusion system. Initiation must occur in a setting where adequate personnel and equipment necessary for hemodynamic monitoring and emergency treatment is available.

Pregnancy Risk FactorB

Pregnancy ConsiderationsSome skeletal malformations and maternal toxicity noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Use with caution and only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Vasodilation (11%)

Central nervous system: Headache (27%)

Dermatologic: Rash (14%)

Gastrointestinal: Diarrhea (25%), nausea (22%)

Local: Infusion site pain (SubQ 85%, may improve after several months of therapy); infusion site reaction (SubQ 83%)

Neuromuscular & skeletal: Jaw pain (13%)

1% to 10%:

Cardiovascular: Edema (9%), hypotension (4%)

Central nervous system: Dizziness (9%)

Dermatologic: Pruritus (8%)

Postmarketing and/or case reports: Anxiety, arm swelling, bone pain, cellulitis, central venous catheter-related line infections, central venous catheter-related sepsis, hematoma, pain, paresthesia, restlessness, thrombocytopenia, thrombophlebitis

Drug Interactions

Anticoagulants: Prostacyclin Analogues may enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Antihypertensives: Prostacyclin Analogues may enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Antiplatelet Agents: Prostacyclin Analogues may enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: Treprostinil may enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Salicylates: Treprostinil may enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Monitoring ParametersBP, dyspnea, fatigue, activity tolerance, symptoms of excessive dose (eg, headache, nausea, vomiting)

Nursing: Physical Assessment/MonitoringTo be used only by clinicians experienced in the diagnosis and treatment of PAH. Initiation of therapy must be performed in a setting with necessary continuous pulmonary and hemodynamic arterial monitoring and emergency care. Therapy may be needed for prolonged periods, possibly years, patient's ability to prepare, administer, and care for continuous infusion per indwelling-central venous catheter via an infusion pump should be carefully assessed. Assess other pharmacological or herbal products patient may be taking for potential interactions (especially anything that may alter blood pressure or coagulation). Assess at beginning of therapy and regular intervals for effectiveness of therapy (improved pulmonary function and quality of life) and any adverse reactions. Teach patient/caregiver how to care for infusion pump and monitor for any pump malfunction, possible side effects/appropriate interventions (eg, monitoring vital signs on regular basis), and adverse or overdose symptoms to report (flushing, headache, hypotension, nausea, vomiting, diarrhea, and seizure activity).

Patient EducationThis drug can only be administered via a continuous infusion delivery system. Therapy will probably be prolonged, possibly for years. You will be taught how to prepare medication and care for and monitor the equipment; follow these directions completely. Notify contact person immediately with any problems or questions with equipment. You will be required to monitor your vital signs at regular intervals. You may experience mild headache, nervousness, or dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help) or muscular pain (use of a mild analgesia may be recommended by your prescriber). Report immediately any signs or symptoms of flushing, increased dizziness or blurred vision, acute or severe headache; increased difficult breathing; fever or chills; any unusual bleeding or bruising; chest pain; palpitations; irregular, slow or fast pulse; seizure activity or any unresolved adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 1 mg/mL (20 mL) [contains sodium chloride 5.3 mg/mL]; 2.5 mg/mL (20 mL) [contains sodium chloride 5.3 mg/mL]; 5 mg/mL (20 mL) [contains sodium chloride 5.3 mg/mL]; 10 mg/mL (20 mL) [contains sodium chloride 4 mg/mL]

Generic AvailableNo

ManufacturerBaxter Pharmaceuticals Solutions LLC; United Therapeutics Corporation (distributor)

Mechanism of ActionTreprostinil is a direct vasodilator of both pulmonary and systemic arterial vascular beds; also inhibits platelet aggregation.

Pharmacodynamics/Kinetics

Absorption: SubQ: Rapidly and completely

Distribution: 14 L/70 kg lean body weight

Protein binding: 91%

Metabolism: Hepatic (enzymes unknown); forms 5 metabolites (HU1-HU5)

Bioavailability: SubQ: 100%

Half-life elimination: Terminal: ~2-4 hours

Excretion: Urine (79%; 4% as unchanged drug, 64% as metabolites); feces (13%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported. Treprostinil may enhance the risk of bleeding associated with other antiplatelet agents (aspirin or NSAIDs).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache

Mental Health: Effects on Psychiatric TreatmentNausea and diarrhea are common, these effects may be additive with concurrent use of SSRIs, lithium, or valproate. Treprostinil inhibits platelet aggregation. Concomitant use with SSRIs which possess some antiplatelet activity may increase the risk of bleeding.

Index TermsTreprostinil Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Tretinoin may be confused with isotretinoin, trientine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(TRET i noyn, oral)

U.S. Brand NamesVesanoid®

Canadian Brand NamesVesanoid®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous; Retinoic Acid Derivative

Use: Labeled IndicationsInduction of remission in patients with acute promyelocytic leukemia (APL), French American British (FAB) classification M3 (including the M3 variant)

Dosing: Adults

Acute promyelocytic leukemia (APL): Oral:

Remission induction: 45 mg/m^2/day in 2-3 divided doses for up to 30 days after complete remission (maximum duration of treatment: 90 days)

Remission maintenance: 45-200 mg/m^2/day in 2-3 divided doses for up to 12 months.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAPL induction of remission, remission maintenance: Oral: Refer to adult dosing.

Dosing: Combination Regimens

Leukemia, acute promyelocytic: Tretinoin-Idarubicin

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OralAdminister with meals; do not crush capsules

Dietary ConsiderationsTo enhance absorption, some clinicians recommend giving with a fatty meal. Capsule contains soybean oil.

StorageStore capsule at 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsSensitivity to parabens, vitamin A, other retinoids, or any component of the formulation; pregnancy

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Boxed warnings:

- Acute promyelocytic leukemia (APL): See “Disease-related concerns” below.
- Experienced physician: See “Other warnings/precautions” below.
- Leukocytosis: See “Concerns related to adverse effects” below.
- Pregnancy: See “Special populations” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Leukocytosis: **[U.S. Boxed Warning]: During treatment, ~40% of patients will develop rapidly evolving leukocytosis;** may be associated with a higher risk of life-threatening complications. If signs and symptoms of the RA-APL syndrome are present together with leukocytosis, initiate treatment with high-dose steroids immediately. Consider adding full-dose chemotherapy (including an anthracycline, if not contraindicated) to the tretinoin therapy on day 1 or 2 for patients presenting with a WBC count of >5 x 10^9/L or immediately, for patients presenting with a WBC count of <5 x 10^9/L, if the WBC count reaches ≥6 x 10^9/L by day 5, or ≥10 x 10^9/L by day 10 or ≥15 x 10^9/L by day 28.

- Lipid effects: Up to 60% of patients experienced hypercholesterolemia or hypertriglyceridemia, which were reversible upon completion of treatment.

- Liver function test abnormalities: Elevated liver function test results occur in 50% to 60% of patients during treatment. Carefully monitor liver function test results during treatment and give consideration to a temporary withdrawal of tretinoin if test results reach >5 times the upper limit of normal.

- Pseudotumor cerebri: Retinoids have been associated with pseudotumor cerebri (benign intracranial hypertension), especially in children. Concurrent use of other drugs associated with this effect (eg, tetracyclines) may increase risk. Early signs and symptoms include papilledema, headache, nausea, vomiting and visual disturbances.

Disease-related concerns:

- Acute promyelocytic leukemia (APL): **[U.S. Boxed Warning]: Patients with APL are at high risk and can have severe adverse reactions to tretinoin. About 25% of patients with APL and treated with tretinoin, have experienced retinoic acid-APL (RA-APL) syndrome, characterized by fever, dyspnea, acute respiratory distress, weight gain, radiographic pulmonary infiltrates and pleural or pericardial effusions, edema, and hepatic, renal, and/or multiorgan failure.** This syndrome has occasionally been accompanied by impaired myocardial contractility and episodic hypotension. It has been observed with or without concomitant leukocytosis. Endotracheal intubation and mechanical ventilation have been required in some cases due to progressive hypoxemia, and several patients have expired with multiorgan failure. The syndrome usually occurs during the first month of treatment, with some cases reported following the first dose. Management of the syndrome has not been defined, but high-dose steroids given at the first suspicion of RA-APL syndrome appear to reduce morbidity and mortality. At the first signs suggestive of the syndrome, immediately initiate high-dose steroids (dexamethasone 10 mg I.V.) every 12 hours for 3 days or until resolution of symptoms, regardless of the leukocyte count. The majority of patients do not require termination of tretinoin therapy during treatment of the RA-APL syndrome.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

- Pregnancy: **[U.S. Boxed Warning]: High risk of teratogenicity; not to be used in women of childbearing potential** unless the woman is capable of complying with effective contraceptive measures. Repeat pregnancy testing and contraception counseling monthly throughout the period of treatment.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy Considerations**[U.S. Boxed Warning]: High risk of teratogenicity; not to be used in women of childbearing potential** unless the woman is capable of complying with effective contraceptive measures. Repeat pregnancy testing and contraception counseling monthly throughout the period of treatment. Major fetal abnormalities and spontaneous abortions have been reported with other retinoids. Effective contraception must be used during treatment and for 1 month following discontinuation of therapy.

LactationEnters breast milk/not recommended

Adverse ReactionsVirtually all patients experience some drug-related toxicity, especially headache, fever, weakness and fatigue. These adverse effects are seldom permanent or irreversible nor do they usually require therapy interruption.

>10%:

Cardiovascular: Peripheral edema (52%), chest discomfort (32%), edema (29%), arrhythmias (23%), flushing (23%), hypotension (14%), hypertension (11%)

Central nervous system: Headache (86%), fever (83%), malaise (66%), pain (37%), dizziness (20%), anxiety (17%), insomnia (14%), depression (14%), confusion (11%)

Dermatologic: Skin/mucous membrane dryness (77%), rash (54%), pruritus (20%), alopecia (14%)

Endocrine & metabolic: Hypercholesterolemia and/or hypertriglyceridemia (60%)

Gastrointestinal: Nausea/vomiting (57%), liver function tests increased (50% to 60%), GI hemorrhage (34%), abdominal pain (31%), mucositis (26%), diarrhea (23%), weight gain (23%), constipation (17%), dyspepsia (14%), abdominal distention (11%), weight loss (17%), xerostomia, anorexia (17%)

Hematologic: Hemorrhage (60%), leukocytosis (40%), disseminated intravascular coagulation (DIC) (26%)

Local: Phlebitis (11%), injection site reactions (17%)

Neuromuscular & skeletal: Bone pain (77%), paresthesia (17%), myalgia (14%)

Ocular: Visual disturbances (17%)

Otic: Earache/ear fullness (23%)

Renal: Renal insufficiency (11%)

Respiratory: Upper respiratory tract disorders (63%), dyspnea (60%), respiratory insufficiency (26%), pleural effusion (20%), pneumonia (14%), rales (14%), expiratory wheezing (14%), dry nose

Miscellaneous: Shivering (63%), infections (58%), retinoic acid-acute promyelocytic leukemia syndrome (25%), diaphoresis increased (20%)

1% to 10%:

Cardiovascular: Cerebral hemorrhage (9%), pallor (6%), cardiac failure (6%), cardiac arrest (3%), MI (3%), enlarged heart (3%), heart murmur (3%), stroke (3%), myocarditis (3%), pericarditis (3%), pulmonary hypertension (3%), secondary cardiomyopathy (3%), ischemia

Central nervous system: Intracranial hypertension (9%), agitation (9%), hallucination (6%), agnosia (3%), aphasia (3%), cerebellar edema (3%), cerebral hemorrhage (9%), seizure (3%), coma (3%), CNS depression (3%), dysarthria (3%), encephalopathy (3%), hypotaxia (3%), light reflex absent (3%), spinal cord disorder (3%), unconsciousness (3%), dementia (3%), forgetfulness (3%), somnolence (3%), slow speech (3%), hypothermia (3%)

Dermatologic: Cellulitis (8%), photosensitivity

Endocrine & metabolic: Acidosis (3%)

Gastrointestinal: Hepatosplenomegaly (9%), ulcer (3%)

Genitourinary: Dysuria (9%), acute renal failure (3%), micturition frequency (3%), renal tubular necrosis (3%), enlarged prostate (3%)

Hepatic: Ascites (3%), hepatitis (3%)

Neuromuscular & skeletal: Tremor (3%), leg weakness (3%), abnormal gait (3%), bone inflammation (3%), asterixis, dysarthria, facial paralysis, flank pain, hemiplegia, hyporeflexia

Ocular: Visual acuity change (6%), visual field deficit (3%), dry eyes

Otic: Hearing loss

Renal: Acute renal failure, renal tubular necrosis

Respiratory: Lower respiratory tract disorders (9%), pulmonary infiltration (6%), bronchial asthma (3%), pulmonary/larynx edema

Miscellaneous: Face edema

<1%: Arterial thrombosis, basophilia, cataracts, conjunctivitis, corneal opacities, erythema nodosum, erythrocyte sedimentation rate increased, gum bleeding, hematocrit decreased, hemoglobin decreased, hypercalcemia, hyperhistaminemia, hyperuricemia, inflammatory bowel syndrome, irreversible hearing loss, mood changes, myositis, optic neuritis, pancreatitis, pseudomotor cerebri, renal infarct, Sweet's syndrome, vasculitis, venous thrombosis

Oncology: Emetic PotentialModerate (30% to 60%)

Metabolism/Transport Effects**Substrate** (minor) of CYP2A6 (minor), 2B6 (minor), 2C8 (major), 2C9 (minor); **Inhibits** CYP2C9 (weak); **Induces** CYP2E1 (weak)

Drug Interactions

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Absorption of retinoids has been shown to be enhanced when taken with food.

Herb/Nutraceutical: St John's wort may decrease tretinoin levels. Avoid dong quai, St John's wort (may also cause photosensitization). Avoid additional vitamin A supplementation. May lead to vitamin A toxicity.

Monitoring ParametersMonitor the patient's hematologic profile, coagulation profile, liver function test results and triglyceride and cholesterol levels frequently

Nursing: Physical Assessment/MonitoringTo be administered under the supervision of a physician who is experienced in the management of patients with acute leukemia. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking. Assess results of laboratory tests closely. Patient will require close monitoring (eg, cardiac, CNS, and respiratory status) on a frequent basis during therapy. Teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor the patient's hematologic profile, coagulation profile, liver function results and triglyceride and cholesterol levels frequently. Consider temporary discontinuation if LFTs are >5 times the upper limit of normal.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take with food. Do not crush, chew, or dissolve capsules. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol and foods containing vitamin A, and foods with high fat content. May cause lethargy, dizziness, visual changes, confusion, anxiety (avoid driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small, frequent meals, chewing gum, or sucking lozenges may help); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); dry, itchy skin; or dry or irritated eyes (avoid contact lenses). Report persistent vomiting or diarrhea, respiratory difficulty, unusual bleeding or bruising, acute GI pain, bone pain, swelling of extremities, unusual weight gain, or vision changes immediately. **Pregnancy/breast-feeding precautions:** Do not get pregnant (females) or cause a pregnancy (males) while taking this medication and for 1 month following completion of therapy. Consult prescriber for appropriate barrier contraceptive measures if necessary or if you suspect you might be pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 10 mg

Vesanoid®: 10 mg [contains soybean oil and parabens]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Vesanoid)

10 mg (30): $808.84

Mechanism of ActionTretinoin appears to bind one or more nuclear receptors and inhibits clonal proliferation and/or granulocyte differentiation

Pharmacodynamics/Kinetics

Protein binding: >95%

Metabolism: Hepatic via CYP; primary metabolite: 4-oxo-all-*trans*-retinoic acid

Half-life elimination: Terminal: Parent drug: 0.5-2 hours

Time to peak, serum: 1-2 hours

Excretion: Urine (63%); feces (30%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, anxiety, insomnia, depression, and confusion are common; may cause agitation, hallucinations, or cognitive impairment; may rarely cause mood changes

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Tretinoin may be confused with isotretinoin, trientine

International issues:

Renova® may be confused with Remov® which is a brand name for nimesulide in Italy

Pronunciation(TRET i noyn, TOP i kal)

U.S. Brand NamesAtralin™; Avita®; Renova®; Retin-A®; Retin-A® Micro; Tretin-X™

Canadian Brand NamesRejuva-A®; Retin-A®; Retin-A® Micro; Retinova®

Pharmacologic CategoryAcne Products; Retinoic Acid Derivative; Topical Skin Product, Acne

Use: Labeled IndicationsTreatment of acne vulgaris; photodamaged skin; palliation of fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin as part of a comprehensive skin care and sun avoidance program

Use: Unlabeled/InvestigationalSome skin cancers

Dosing: Adults

Acne vulgaris: Topical: Begin therapy with a weaker formulation of tretinoin (0.025% cream, 0.04% microsphere gel, or 0.01% gel) and increase the concentration as tolerated; apply once daily to acne lesions before retiring or on alternate days; if stinging or irritation develop, decrease frequency of application

Palliation of fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin: Topical: Pea-sized amount of the 0.02% or 0.05% cream applied to entire face once daily in the evening

Dosing: ElderlyUse of the 0.02% cream in patients 65-71 years of age showed similar improvement in fine wrinkles as seen in patients <65 years. Safety and efficacy of the 0.02% cream have not been established in patients >71 years of age. Safety and efficacy of the 0.05% cream have not been established in patients >50 years of age.

Dosing: PediatricChildren >12 years: Acne vulgaris: Topical: Refer to adult dosing.

Administration: TopicalPalliation of fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin: Cream: Prior to application, gently wash face with a mild soap. Pat dry. Wait 20-30 minutes to apply cream. Avoid eyes, ears, nostrils, and mouth.

StorageStore at 25°C (77°F). Gel is flammable; keep away from heat and flame.

ContraindicationsHypersensitivity to tretinoin or any component of the formulation; sunburn

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: Use is associated with increased susceptibility/sensitivity to UV light; avoid sunlamps or excessive sunlight exposure. Daily sunscreen use and other protective measures recommended.

- Skin irritation: Treatment can increase skin sensitivity to weather extremes of wind or cold. Also, concomitant topical medications (eg, medicated or abrasive soaps, cleansers, or cosmetics with a strong drying effect) should be used with caution due to increased skin irritation.

Disease-related concerns:

- Eczema: Use with caution in patients with eczema.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Cream 0.02% Do not use the 0.02% cream for longer than 52 weeks when using for palliation of fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin.

- Cream 0.05% Do not use the 0.05% cream for longer than 48 weeks when using for palliation of fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin.

- Gel: Flammable; do not expose to high temperatures or flame.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with abraded skin, sunburned skin, mucous membranes, eyes, mouth, angles of the nose. Not for use on moderate- to heavily-pigmented skin.

Pregnancy Risk FactorC

Pregnancy ConsiderationsOral tretinoin is teratogenic and fetotoxic in rats at doses 1000 and 500 times the topical human dose, respectively. Tretinoin does not appear to be teratogenic when used topically since it is rapidly metabolized by the skin; however, there are rare reports of fetal defects. Use for acne only if benefit to mother outweighs potential risk to fetus. During pregnancy, do not use for palliation of fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin.

LactationEnters breast milk/compatible

Adverse Reactions

>10%: Dermatologic: Excessive dryness, erythema, scaling of the skin, pruritus

1% to 10%:

Dermatologic: Hyperpigmentation or hypopigmentation, photosensitivity, initial acne flare-up

Local: Edema, blistering, stinging

Metabolism/Transport Effects**Substrate** of CYP2A6 (minor), 2B6 (minor), 2C8 (major), 2C9 (minor); **Inhibits** CYP2C9 (weak); **Induces** CYP2E1 (weak)

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb Interactions

Food: Avoid excessive intake of vitamin A (cod liver oil, halibut fish oil).

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid excessive amounts of vitamin A supplements.

Nursing: Physical Assessment/MonitoringAssess knowledge/instruct patient on appropriate application, possible adverse effects, and symptoms to report.

Patient EducationFor once-daily use, do not overuse. Avoid increased intake of vitamin A. Thoroughly wash hands before applying. Wash area to be treated at least 30 minutes before applying. Do not wash face more frequently than 2-3 times a day. Do not apply to areas near your mouth, eyes, corners of your nose, or open sores. Avoid using topical preparations that contain alcohol or harsh chemicals during treatment. It may take several weeks before the full benefit of the medication is seen. You may experience increased sensitivity to sunlight; protect skin with sunblock (minimum SPF 15), wear protective clothing, and avoid direct sunlight. Stop treatment and inform prescriber if rash, skin irritation, redness, scaling, or excessive dryness occurs. When used for hyperpigmentation and tactile redness of facial skin, wrinkles will not be eliminated. Must be used in combination with a comprehensive skin care program. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Gel: Flammable; do not expose to flame and do not smoke during use.

Pharmacologic CategoryChemotherapy Regimen, Leukemia, Acute Myeloid M3 (Promyelocytic)

Regimen UseLeukemia, acute promyelocytic

RegimenNOTE: Multiple variations are listed below.

Induction:

Variation 1:

Tretinoin: Oral: 45 mg/m^2/day day 1 up to 90 days

[total dose/cycle = up to 4050 mg/m^2]

≤20 years: 25 mg/m^2/day day 1 up to 90 days

[total dose/cycle = up to 2250 mg/m^2]

Idarubicin: I.V.: 12 mg/m^2/day days 2, 4, 6, and 8

[total dose/cycle = 48 mg/m^2]

Consolidation:

Course 1:

Idarubicin: I.V.: 5 mg/m^2/day days 1 to 4

[total dose/cycle = 20 mg/m^2]

or

Idarubicin: I.V.: 7 mg/m^2/day days 1 to 4

[total dose/cycle = 28 mg/m^2]

Tretinoin: Oral: 45 mg/m^2/day days 1 to 15

[total dose/cycle = 675 mg/m^2]

Course 2:

Mitoxantrone: I.V.: 10 mg/m^2/day days 1 to 5

[total dose/cycle = 50 mg/m^2]

or

Mitoxantrone: I.V.: 10 mg/m^2/day days 1 to 5

[total dose/cycle = 50 mg/m^2]

Tretinoin: Oral: 45 mg/m^2/day days 1 to 15

[total dose/cycle = 675 mg/m^2]

Course 3:

Idarubicin: I.V.: 12 mg/m^2 day 1

[total dose/cycle = 12 mg/m^2]

or

Idarubicin: I.V.: 12 mg/m^2/day days 1 and 2

[total dose/cycle = 24 mg/m^2]

Tretinoin: Oral: 45 mg/m^2/day days 1 to 15

[total dose/cycle = 675 mg/m^2]

Administer courses sequentially at 1-month intervals for 3 months

Maintenance:

Mercaptopurine: Oral: 50 mg/m^2 daily

[total dose/cycle = 4500 mg/m^2 (90 days)]

Methotrexate: I.M.: 15 mg/m^2 weekly

[total dose/cycle = 180 mg/m^2]

Tretinoin: Oral: 45 mg/m^2/day days 1 to 15

[total dose/cycle = 675 mg/m^2]

Repeat cycle every 3 months for 2 years

Variation 2:

Induction:

Tretinoin: Oral: 45 mg/m^2/day day 1 up to 90 days

[total dose/cycle = up to 4050 mg/m^2]

<15 years: 25 mg/m^2/day day 1 up to 90 days

[total dose/cycle = up to 2250 mg/m^2]

Idarubicin: I.V.: 12 mg/m^2/day days 2, 4, 6, and 8

[total dose/cycle = 48 mg/m^2]

Consolidation:

Course 1:

Idarubicin: I.V.: 5 mg/m^2/day days 1 to 4

[total dose/cycle = 20 mg/m^2]

Course 2:

Mitoxantrone: I.V.: 10 mg/m^2/day days 1 to 5

[total dose/cycle = 50 mg/m^2]

Course 3:

Idarubicin: I.V.: 12 mg/m^2 day 1

[total dose/cycle = 12 mg/m^2]

Administer courses sequentially at 1-month intervals for 3 months

Maintenance:

Mercaptopurine: Oral: 90 mg/m^2 daily

[total dose/cycle = 8100 mg/m^2]

Methotrexate: I.M.: 15 mg/m^2 weekly

[total dose/cycle = 180 mg/m^2]

Tretinoin: Oral: 45 mg/m^2/day days 1 to 15

[total dose/cycle = 675 mg/m^2]

Repeat cycle every 3 months for 2 years

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Kenalog® may be confused with Ketalar®

Pronunciation(trye am SIN oh lone a SEE toe nide paste)

Canadian Brand NamesOracort®

Pharmacologic CategoryAnti-inflammatory Agent; Corticosteroid, Topical

Use: DentalFor adjunctive treatment and for the temporary relief of symptoms associated with oral inflammatory lesions and ulcerative lesions resulting from trauma

Dosing: Adults**Oral inflammatory lesions/ulcers:** Topical: Press a small dab (about $^1/_4$ inch) to the lesion until a thin film develops. A larger quantity may be required for coverage of some lesions. For optimal results use only enough to coat the lesion with a thin film.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to triamcinolone or any component of the formulation; contraindicated in the presence of fungal, viral, or bacterial infections of the mouth or throat

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Impaired immune response: Normal immune responses of the oral tissues are depressed in patients receiving topical corticosteroid therapy; virulent strains of oral microorganisms may multiply without producing the usual warning symptoms of oral infections.

- Local irritation: If local irritation or sensitization should develop, the preparation should be discontinued.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus.

- Peptic ulcer: Use with caution in patients with peptic ulcer.

- Tuberculosis: Use with caution in patients with tuberculosis.

Other warnings/precautions:

- Duration of therapy: If significant regeneration or repair of oral tissues has not occurred in seven days, re-evaluation of the etiology of the oral lesion is advised.

- Systemic effects: The small amount of steroid released from the topical preparation makes systemic effects very unlikely.

Pregnancy Risk FactorC

Adverse ReactionsNo data reported

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Paste, oral, topical, as acetonide: 0.1% (5 g)

Generic AvailableYes

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability; suppresses the immune system by reducing activity and volume of the lymphatic system; suppresses adrenal function at high doses

Pharmacodynamics/Kinetics

Absorption: Systemic

Half-life elimination, serum: Biological: 18-36 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Medication Safety Issues

Sound-alike/look-alike issues:

Kenalog® may be confused with Ketalar®

Nasacort® may be confused with NasalCrom®

TAC (occasional abbreviation for triamcinolone) is an error-prone abbreviation (mistaken as tetracaine-adrenaline-cocaine)

Pronunciation(trye am SIN oh lone)

U.S. Brand NamesAristospan®; Azmacort®; Kenalog-10®; Kenalog-40®; Kenalog®; Nasacort® AQ; Tri-Nasal® [DSC]; Triderm®; Triesence™; Trivaris™; Zytopic™

Canadian Brand NamesAristospan®; Kenalog®; Kenalog® in Orabase; Nasacort® AQ; Oracort; Triaderm; Trinasal®

Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal; Corticosteroid, Ophthalmic; Corticosteroid, Systemic; Corticosteroid, Topical

Use: Labeled Indications

Intra-articular (soft tissue): Acute gouty arthritis, acute/subacute bursitis, acute tenosynovitis, epicondylitis, rheumatoid arthritis, synovitis of osteoarthritis

Intralesional: Alopecia areata, discoid lupus erythematosus, keloids, granuloma annulare lesions (localized hypertrophic, infiltrated, or inflammatory), lichen planus plaques, lichen simplex chronicus plaques, psoriatic plaques, necrobiosis lipoidica diabeticorum, cystic tumors of aponeurosis or tendon (ganglia)

Nasal inhalation: Management of seasonal and perennial allergic rhinitis

Ophthalmic: Intravitreal: treatment of sympathetic ophthalmia, temporal arteritis, uveitis, ocular inflammatory conditions unresponsive to topical corticosteroids

Triesence™: Visualization during vitrectomy

Oral inhalation: Control of bronchial asthma and related bronchospastic conditions

Oral topical: Adjunctive treatment and temporary relief of symptoms associated with oral inflammatory lesions and ulcerative lesions resulting from trauma

Systemic: Adrenocortical insufficiency, dermatologic diseases, endocrine disorders, gastrointestinal diseases, hematologic and neoplastic disorders, nervous system disorders, nephrotic syndrome, rheumatic disorders, allergic states, respiratory diseases, systemic lupus erythematosus (SLE), and other diseases requiring anti-inflammatory or immunosuppressive effects

Topical: Inflammatory dermatoses responsive to steroids

Use: DentalOral topical: Adjunctive treatment and temporary relief of symptoms associated with oral inflammatory lesions and ulcerative lesions resulting from trauma

Dosing: AdultsThe lowest possible dose should be used to control the condition; when dose reduction is possible, the dose should be reduced gradually. Parenteral dose is usually $^{1}/_{3}$ to $^{1}/_{2}$ the oral dose given every 12 hours. In life-threatening situations, parenteral doses larger than the oral dose may be needed.

Allergic rhinitis (perennial or seasonal):

Nasal spray: 220 mcg/day as 2 sprays in each nostril once daily; once symptoms controlled reduce to 110 mcg/day

Nasal inhaler: Initial: 220 mcg/day as 2 sprays in each nostril once daily; may increase dose to 440 mcg/day (given once daily or divided and given 2 or 4 times/day)

Asthma: Oral inhalation: 150 mcg 3-4 times/day **or** 300 mcg twice daily; maximum dose: 1200 mcg/day

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

"Low" dose: 300-750 mcg/day

"Medium" dose: >750-1500 mcg/day

"High" dose: >1500 mcg/day

Carditis (acute rheumatic): Oral: Initial: 20-60 mg/day; reduce dose during maintenance therapy

Dermatoses (steroid-responsive, including contact/atopic dermatitis):

- Injection:
  - Acetonide: Intradermal: Initial: 1 mg
  - Hexacetonide: Intralesional, sublesional: up to 0.5 mg/square inch of affected skin
- Topical:
  - Cream, Ointment:
    - 0.025%: Apply thin film to affected areas 2-4 times/day
    - 0.1% or 0.5%: Apply thin film to affected areas 2-3 times/day
  - Spray: Apply to affected area 3-4 times/day

Hay fever/pollen asthma: I.M.: 40-100 mg as a single injection/season

Multiple sclerosis (acute exacerbation): I.M.: 160 mg daily for 1 week, followed by 64 mg every other day for 1 month

Ocular disease: Intravitreal: Initial: 4 mg as a single dose; additional doses may be given as needed

Oral inflammatory lesions/ulcers: Oral topical: Press a small dab (about $^1/_4$ inch) to the lesion until a thin film develops; a larger quantity may be required for coverage of some lesions. For optimal results, use only enough to coat the lesion with a thin film; do not rub in.

Rheumatic or arthritic disorders:

- Intra-articular (or similar injection as designated):
  - Acetonide: Intra-articular, intrabursal, tendon sheaths: Initial: Smaller joints: 2.5-5 mg, larger joints: 5-15 mg; may require up to 10 mg for small joints and up to 40 mg for large joints; maximum dose/treatment (several joints at one time): 20-80 mg
  - Hexacetonide: Intra-articular: Initial range: 2-20 mg/day
- I.M.:
  - Acetonide: Range: 2.5-100 mg/day; Initial: 60 mg

See table.

Triamcinolone Dosing

	Acetonide	**Hexacetonide**
Intrasynovial	5-40 mg	
Intralesional	1-30 mg (usually 1 mg per injection site); 10 mg/mL suspension usually used	Up to 0.5 mg/sq inch affected area
Sublesional	1-30 mg	
Systemic I.M.	2.5-60 mg/dose (usual adult dose: 60 mg; may repeat with 20-100 mg dose when symptoms recur)	
Intra-articular	2.5-40 mg	2-20 mg average
large joints	5-15 mg	10-20 mg
small joints	2.5-5 mg	2-6 mg
Tendon sheaths	2.5-10 mg	
Intradermal	1 mg/site	

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Allergic rhinitis (perennial or seasonal):

Nasal spray:

Children 2-5 years: 110 mcg/day as 1 spray in each nostril once daily (maximum: 110 mcg/day)

Children 6-11 years: Initial: 110 mcg/day as 1 spray in each nostril once daily; may increase to 220 mcg/day as 2 sprays in each nostril if response not adequate; once symptoms controlled may reduce to 110 mcg/day

Children ≥12 years: Refer to adult dosing.

Nasal inhaler:

Children 6-11 years: Initial: 220 mcg/day as 2 sprays in each nostril once daily

Children ≥12 years: Refer to adult dosing.

Asthma:*Oral inhalation:*

Children 6-12 years: 75-150 mcg 3-4 times/day **or** 150-300 mcg twice daily; maximum dose: 900 mcg/day

Children >12 years: Refer to adult dosing.

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

Children: 5-11 years:

“Low” dose: 300-600 mcg/day

“Medium” dose: >600-900 mcg/day

“High” dose: >900 mcg/day

Children ≥12 years: Refer to adult dosing.

Ocular disease/visualization during vitrectomy: Refer to adult dosing.

Rheumatic conditions:*I.M. (acetonide):* Range: 2.5-100 mg/day

Children: Initial: 0.11-1.6 mg/kg/day in 3-4 divided doses

Children 6-12 years: Initial: 40 mg

Children ≥12 years: Refer to adult dosing.

Calculations

- Corticosteroid Conversion

Administration: I.M.Inject I.M. dose deep in large muscle mass, avoid deltoid.

Administration: Inhalation

Intranasal: Spray/inhaler: Shake well prior to use. Gently blow nose to clear nostrils.

Nasacort® AQ: Prime prior to first use, by shaking contents well and releasing 5 sprays into the air. If product is not used for more than 2 weeks, reprime with 1 spray.

Oral: Shake well prior to use. Rinse mouth and throat after using inhaler to prevent candidiasis. Use spacer device provided with Azmacort®. To prime inhaler prior to first use, shake inhaler, then press cannister to release 2 puffs. Inhaler will need to reprimed if not used for longer than 3 days.

Administration: Topical

Oral topical: Apply small dab to lesion until a thin film develops; do not rub in. Apply at bedtime or after meals if applications are needed throughout the day.

Topical:

Ointment: Apply a thin film sparingly. Do not use on open skin or wounds. Do not occlude area unless directed; if using occluding dressing, monitor for infection.

Spray: Avoid eyes and do not inhale if spraying near face. Occlusive dressing may be used if instructed; monitor for infection.

Administration: OtherAvoid subcutaneous administration.

Ophthalmic injection (intravitreal):

Triescence™: Not for I.V. use. Shake vial well prior to use. Administer under controlled aseptic conditions (eg, sterile gloves, sterile drape, sterile eyelid speculum). Adequate anesthesia and a broad-spectrum bactericidal agent should be administered prior to injection. Inject immediately after withdrawing from vial. If administration is required in the second eye, a new vial should be used. Do not use if agglomerated (clumpy or granular appearance).

Trivaris™: Can be administered intravitreal; **not for I.V use**. Bring to room temperature prior to administration. A 27 gauge $^{1}/_{2}$-inch needle is recommended for intravitreal administration.

Dietary Considerations

May be taken with food to decrease GI distress. Ensure adequate intake of calcium and vitamins (or consider supplementation) in patients on medium-to-high doses of systemic corticosteroids.

Storage

Injection, suspension:

Acetonide injectable suspension:

Kenalog®: Store at 20°C to 25°C (68°F to 77°F); avoid freezing. Protect from light.

Triesence™ : Store at 4°C to 25°C (39°F to 77°F); do not freeze. Protect from light.

Trivaris™: Store at 2°C to 8°C (36°F to 46°F); avoid freezing. Protect from light.

Hexacetonide injectable suspension: Diluted suspension stable up to 1 week.

Inhalation, oral: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F); avoid excessive heat. Do not puncture.

Intranasal: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F); do not freeze.

Topical:

Ointment: Store at room temperature.

Spray: Store at room temperature; avoid excessive heat.

Reconstitution

Hexacetonide injectable suspension: Avoid diluents containing parabens, phenol, or other preservatives (may cause flocculation). Suspension for intralesional use may be diluted with D_5NS, $D_{10}NS$ or SWFI to a 1:1, 1:2, or 1:4 concentration. Solutions for intra-articular use, may be diluted with lidocaine 1% or 2%.

Contraindications

Hypersensitivity to triamcinolone or any component of the formulation; systemic fungal infections; primary treatment of status asthmaticus or other acute episodes of asthma; fungal, viral, or bacterial infections of the mouth or throat (oral topical formulation); cerebral malaria; idiopathic thrombocytopenic purpura (I.M. injection)

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs stop steroid and treat with a fast-acting bronchodilator (eg, albuterol).

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex, cerebral malaria, or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment). Use with caution in patients with threadworm infection; may cause serious hyperinfection.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Cardiovascular disease: Use with caution in patients with HF or hypertension; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Risk is increased in patients receiving ophthalmic injection; monitor closely for increased intraocular pressure. Consider routine eye exams in chronic users. Do not use in patients with active ocular herpes simplex.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention and hypertension may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

- Tuberculosis: Restrict corticosteroid use to fulminating or disseminated tuberculosis; must be used in conjunction with appropriate tuberculosis regimen. Monitor closely in patients with latent tuberculosis.

Concurrent drug therapy issues:

- Immunizations: Patients should not be immunized with live, viral vaccines while receiving immunosuppressive doses of corticosteroids. The ability to respond to dead viral vaccines is unknown.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration. Azmacort® (metered dose inhaler) comes with its own spacer device attached and may be easier to use in older patients.

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients.

Dosage form specific issues:

- High potency products: Avoid the use of high potency steroids on the face.

- Injection: Benzyl alcohol: Some injection suspension formulations contain benzyl alcohol; benzyl alcohol has been associated with the "gasping syndrome" in neonates and low-birth-weight infants.

- Injection: Ocular effects :Intravitreal (Triesence™, Trivaris™) injection has been associated with endophthalmitis and visual disturbances. Blindness has been reported following injection into nasal turbinates and intralesional injections into the head. Safety of intraturbinal, subconjunctival, subtenons, retrobulbar, or has not been demonstrated. Some formulations should not be administered intravitreally.

- Topical: Do not use occlusive dressings on weeping or exudative lesions and general caution with occlusive dressings should be observed; discontinue if skin irritation or contact dermatitis should occur; do not use in patients with decreased skin circulation.

- Topical (oral): Discontinue if local irritation or sensitization should develop. If significant regeneration or repair of oral tissues has not occurred in seven days, re-evaluation of the etiology of the oral lesion is advised.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw systemic therapy with gradual tapering of dose. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time. Azmacort® (metered dose inhaler) comes with its own spacer device attached and may be easier to use in older patients.

Pregnancy Risk FactorC/D (ophthalmic suspension)

Pregnancy ConsiderationsTriamcinolone was shown to be teratogenic following inhalation in animal studies and adverse events have been observed with corticosteroids in animal reproduction studies. Some studies have shown an association between first trimester corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsCorticosteroids are excreted in human milk; information specific to triamcinolone has not been located.

Adverse Reactions

Inhalation (nasal, oral):

>10%:

Central nervous system: Headache (2% to 51%)

Respiratory: Pharyngitis (5% to 25%)

1% to 10%:

Cardiovascular: Facial edema (1% to 3%)

Central nervous system: Pain (1% to 3%)

Dermatologic: Photosensitivity (1% to 3%), rash (1% to 3%)

Endocrine & metabolic: Dysmenorrhea (≥2%)

Gastrointestinal: Taste perversion (5% to 8%), dyspepsia (3% to 5%), abdominal pain (1% to 5%), nausea (2% to 3%), diarrhea (1% to 3%), oral moniliasis (1% to 3%), toothache (1% to 3%), vomiting (1% to 3%), weight gain (1% to 3%), xerostomia (1% to 3%)

Genitourinary: Cystitis (1% to 3%), urinary tract infection (1% to 3%), vaginal moniliasis (1% to 3%)

Local: Nasal burning (≥2%; transient), nasal stinging (≥2%; transient)

Neuromuscular & skeletal: Back pain (2% to 8%), bursitis (1% to 3%), myalgia (1% to 3%), tenosynovitis (1% to 3%)

Ocular: Conjunctivitis (1% to 4%)

Otic: Otitis media (≥2%)

Respiratory: Sinusitis (2% to 9%), cough (≤8%), epistaxis (≤5%), bronchitis (children 3%), chest congestion (1% to 3%), asthma (≥2%), rhinitis (≥2%)

Miscellaneous: Flu-like syndrome (2% to 9%), voice alteration (1% to 3%), allergic reaction (≥2%), infection (≥2%)

<1%, postmarketing, and/or case reports: Anaphylaxis, blood cortisol decreased, bone mineral density loss (rare; prolonged use), cataracts, dizziness, dry throat, dyspnea, fatigue, glaucoma, growth suppression, hoarseness, hypersensitivity, insomnia, intraocular pressure increased, nasal septum perforation, oral candidiasis, osteoporosis (rare; prolonged use), pruritus, sneezing, throat irritation, urticaria (rare), wheezing, wound healing impaired

Injection:

Frequency not defined; reactions reported with corticosteroid therapy in general:

Cardiovascular: Arrhythmia, bradycardia, cardiac arrest, cardiac enlargement, CHF, circulatory collapse, edema, hypertension, hypertrophic cardiomyopathy (premature infants), myocardial rupture (following recent MI), syncope, tachycardia, thromboembolism, vasculitis

Central nervous system: Arachnoiditis (I.T.), depression, emotional instability, euphoria, headache, insomnia, intracranial pressure increased, malaise, meningitis (I.T.), mood changes, neuritis, neuropathy, personality change, pseudotumor cerebri (with discontinuation), seizure, vertigo

Dermatologic: Abscess (sterile), acne, allergic dermatitis, angioedema, atrophy (cutaneous/subcutaneous), bruising, dry skin, erythema, hair thinning, hirsutism, hyper-/hypopigmentation, hypertrichosis, impaired wound healing, lupus erythematosus-like lesions, petechiae, purpura, rash, skin test suppression, striae, thin skin

Endocrine & metabolic: Carbohydrate intolerance, Cushingoid state, diabetes mellitus, fluid retention, glucose intolerance, growth suppression (children), hypokalemia, hypokalemic alkalosis, menstrual irregularities, negative nitrogen balance, sodium retention, sperm motility altered

Gastrointestinal: Abdominal distention, appetite increased, GI hemorrhage, GI perforation, nausea, pancreatitis, peptic ulcer, ulcerative esophagitis, weight gain

Hepatic: Hepatomegaly, liver function tests increased

Local: Thrombophlebitis

Neuromuscular & skeletal: Aseptic necrosis of femoral and humeral heads, calcinosis, Charcot-like arthropathy, fractures, joint tissue damage, muscle mass loss, myopathy, osteoporosis, parasthesia, tendon rupture, vertebral compression fractures, weakness

Ocular: Cataracts, exophthalmos, glaucoma, ocular pressure increased, papilledema

Renal: Glycosuria

Respiratory: Pulmonary edema

Miscellaneous: Abnormal fat deposits, anaphylactoid reaction, anaphylaxis, diaphoresis, hiccups, infection, moon face

Ophthalmic:

>10%: Ocular: Cataract progression (20% to 60%), intraocular pressure increased (20% to 60%)

1% to 10%: Ocular: ≤2%: Blurred vision, conjunctival hemorrhage, discomfort (transient), endophthalmitis, glaucoma, hypopyon, inflammation, optic disc vascular disorder, retinal detachment, vitreous floaters, visual acuity decreased

<1%, postmarketing, and/or case reports: Exophthalmos

Topical:

Frequency not defined:

Dermatologic: Acneiform eruptions, allergic contact dermatitis, dryness, folliculitis,, hypertrichosis, hypopigmentation, itching, miliaria, perioral dermatitis, skin atrophy, skin infection (secondary), skin maceration, striae

Local: Burning, irritation

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Triamcinolone interferes with calcium absorption.

Herb/Nutraceutical: Avoid cat's claw, echinacea (have immunostimulant properties).

Monitoring ParametersOphthalmic injection (intravitreal): Following injection monitor for increased intraocular pressure and endophthalmitis; check for perfusion of optic nerve head immediately after injection, tonometry within 30 minutes, biomicroscopy between 2-7 days after injection.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse effects according to indications for therapy, dose, route (systemic or topical), and duration of therapy. With systemic administration, patients with diabetes should monitor glucose levels closely (corticosteroids may alter glucose levels). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. When used for long-term therapy (>10-14 days), do not discontinue abruptly; decrease dosage incrementally.

Patient EducationThis drug is not intended for use during an acute asthma attack or for the relief of a bronchospasm. May take up to 2 weeks until the full effectiveness is seen. Use exactly as directed; do not increase dose or discontinue abruptly without consulting prescriber. Take oral medication with or after meals. Avoid alcohol. Limit intake of caffeine or stimulants. Prescriber may recommend increased dietary vitamins, minerals, or iron. If you have diabetes, monitor glucose levels closely (antidiabetic medication may need to be adjusted). Inform prescriber if you are experiencing greater than normal levels of stress (medication may need adjustment). Some forms of this medication may cause GI upset (oral medication may be taken with meals to reduce GI upset; or small frequent meals and frequent mouth care may reduce GI upset). You may be more susceptible to infection (avoid crowds and exposure to infection). Report promptly excessive nervousness or sleep disturbances; any signs of infection (sore throat, unhealed injuries); excessive growth of body hair or loss of skin color; vision changes; excessive or sudden weight gain (>3 lb/week); swelling of face or extremities; respiratory difficulty; muscle weakness; change in color of stools (black or tarry) or persistent abdominal pain; or worsening of condition or failure to improve. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Aerosol: Shake gently before use. Use at regular intervals, no more frequently than directed. Not for use during acute asthmatic attack. Follow directions that accompany product. Rinse mouth and throat after use to prevent candidiasis. Do not use intranasal product if you have a nasal infection, nasal injury, or recent nasal surgery. If using two products, consult prescriber in which order to use the two products. Report unusual cough or spasm; persistent nasal bleeding, burning, or irritation; or worsening of condition.

Inhalation: Sit when using. Take deep breaths for 3-5 minutes, and clear nasal passages before administration (use decongestant as needed). Hold breath for 5-10 seconds after use, and wait 1-3 minutes between inhalations. Follow package insert instructions for use. Do not exceed maximum dosage. If also using inhaled bronchodilator, use before triamcinolone. Rinse mouth and throat after use to reduce aftertaste and prevent candidiasis.

Topical: For external use only. Not for eyes or mucous membranes or open wounds. Apply in very thin layer to occlusive dressing. Apply dressing to area being treated. Avoid prolonged or excessive use around sensitive tissues, genital, or rectal areas. Inform prescriber if condition worsens (swelling, redness, irritation, pain, open sores) or fails to improve.

Product Availability Trivaris™: FDA approved June 2008; availability currently undetermined

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol for oral inhalation, as acetonide:

Azmacort®: 75 mcg per actuation (20 g) [contains chlorofluorocarbon; 240 actuations]

Aerosol, topical, as acetonide:

Kenalog®: 0.2 mg/2-second spray (63 g) [contains dehydrated ethanol 10.3%]

Cream, as acetonide: 0.025% (15 g, 80 g, 454 g); 0.1% (15 g, 80 g, 454 g, 2270 g); 0.5% (15 g)

Triderm®: 0.1% (30 g, 85 g)

Zytopic™: 0.1% (85 g)

Injection, suspension, as acetonide:

Kenalog-10®: 10 mg/mL (5 mL) [contains benzyl alcohol, polysorbate 80; not for I.V. or I.M. use]

Kenalog-40®: 40 mg/mL (1 mL, 5 mL, 10 mL) [contains benzyl alcohol, polysorbate 80; not for I.V. or intradermal use]

Triesence™: 40 mg/mL (1 mL) [contains polysorbate 80; not for I.V. use]

Trivaris™: 80 mg/mL (0.1 mL) [preservative free; not for I.V. use; (for intra-articular, intramuscular, intravitreal use)]

Injection, suspension, as hexacetonide:

Aristospan®: 5 mg/mL (5 mL); 20 mg/mL (1 mL, 5 mL) [contains benzyl alcohol, polysorbate 80; not for I.V. use]

Lotion, as acetonide: 0.025% (60 mL); 0.1% (60 mL)

Ointment, topical, as acetonide: 0.025% (15 g, 80 g, 454 g); 0.05% (430 g); 0.1% (15 g, 80 g, 454 g); 0.5% (15 g)

Paste, oral, topical, as acetonide: 0.1% (5 g)

Powder, for prescription compounding, as acetonide [micronized]: Triamcinolone acetonide USP (5 g)

Solution, intranasal, as acetonide [spray]:

Tri-Nasal®: 50 mcg/inhalation (15 mL) [120 actuations] [DSC]

Suspension, intranasal, as acetonide [spray]:

Nasacort® AQ: 55 mcg/inhalation (16.5 g) [120 actuations]

Generic AvailableYes: Cream, lotion, ointment, paste, powder

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability; suppresses the immune system by reducing activity and volume of the lymphatic system; suppresses adrenal function at high doses

Pharmacodynamics/Kinetics

Duration: Oral: 8-12 hours

Absorption: Topical: Systemic

Distribution: V_d: 99.5 L

Protein binding: ~68%

Time to peak: I.M.: 8-10 hours

Half-life elimination: Biologic: 18-36 hours; Intravitreal: Nonvitrectomized patients: 13-24 days, Vitrectomized patients: ~3 days (based upon 1 patient)

Excretion: Urine (~40%); feces (~60%)

Related Information

- Asthma
- Corticosteroids
- Inhalant Agents

Pharmacotherapy Pearls16 mg triamcinolone is equivalent to 100 mg cortisone (no mineralocorticoid activity).

Effects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Ulcerative esophagitis, perioral dermatitis, atrophy of oral mucosa, burning, irritation, and oral monilia (oral inhaler).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNervousness and insomnia are common; may cause drowsiness, delirium, euphoria, hallucinations, or mood swings

Mental Health: Effects on Psychiatric TreatmentBarbiturates may increase the metabolism of triamcinolone

Cardiovascular ConsiderationsInhaled steroid therapy, usually used for chronic obstructive lung disease, has the important advantage of having minimal systemic effects. The inhaled steroid, when administered appropriately, may be assumed to have pulmonary effects equivalent to about 10 mg of oral steroids but with minimal systemic consequences. Oral and intravenous steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Triamcinolone is a long-acting corticosteroid with minimal sodium-retaining potential.

Evidence-Based Information:

Neuromuscular Effects: ICU-acquired paresis was recently studied in five ICUs (three medical and two surgical ICUs) at four French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (de Jonghe, 2002). Each patient had to be mechanically ventilated for ≥7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluated, about 25% developed ICU-acquired paresis. Independent predictors included female gender, the number of days with ≥2 organ dysfunction, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appears to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible.

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (eg, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures have been published (Coursin, 2002; Salem, 1994).

Index TermsTriamcinolone Acetonide, Aerosol; Triamcinolone Acetonide, Parenteral; Triamcinolone Diacetate, Oral; Triamcinolone Diacetate, Parenteral; Triamcinolone Hexacetonide; Triamcinolone, Oral

Triamterene

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Triamterene may be confused with trimipramine

Dyrenium® may be confused with Pyridium®

Pronunciation(trye AM ter een)

U.S. Brand NamesDyrenium®

Pharmacologic CategoryDiuretic, Potassium Sparing

Use: Labeled IndicationsAlone or in combination with other diuretics in treatment of edema and hypertension; decreases potassium excretion caused by kaliuretic diuretics

Dosing: Adults**Edema, hypertension:** Oral: 100-300 mg/day in 1-2 divided doses; maximum dose: 300 mg/day; usual dosage range (JNC 7): 50-100 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Hypertension (unlabeled use):** Oral: Initial: 1-2 mg/kg/day in 2 divided doses; maximum: 3-4 mg/kg/day, up to 300 mg/day

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Avoid use.

Dosing: Hepatic ImpairmentDose reduction is recommended in patients with cirrhosis.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken with food.

ContraindicationsHypersensitivity to triamterene or any component of the formulation; patients receiving other potassium-sparing diuretics; anuria; severe hepatic disease; hyperkalemia or history of hyperkalemia; severe or progressive renal disease; pregnancy (expert analysis)

Warnings/Precautions

Boxed warnings:

- Hyperkalemia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fluid/electrolyte loss: Excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.
- Hyperkalemia: **[U.S. Boxed Warning]: Hyperkalemia can occur; patients at risk include those with renal impairment, diabetes, the elderly, and the severely ill. Serum potassium levels must be monitored at frequent intervals especially when dosages are changed or with any illness that may cause renal dysfunction.**
- Photosensitivity: Can cause photosensitivity.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Kidney stones: Use with caution in patients with kidney stones.

Concurrent drug therapy issues:

- Potassium supplements: Avoid potassium supplements, potassium-containing salt substitutes, a diet rich in potassium, or other drugs that can cause hyperkalemia.

Geriatric ConsiderationsMonitor serum potassium.

Pregnancy Risk FactorB (manufacturer); D (expert analysis)

Pregnancy ConsiderationsNo data available. Generally, use of diuretics during pregnancy is avoided due to risk of decreased placental perfusion.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsNo data available.

Adverse Reactions

1% to 10%:

Cardiovascular: Hypotension, edema, CHF, bradycardia

Central nervous system: Dizziness, headache, fatigue

Gastrointestinal: Constipation, nausea

Respiratory: Dyspnea

<1% (Limited to important or life-threatening): Inability to achieve or maintain an erection, agranulocytosis, thrombocytopenia

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Drospirenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Indomethacin: May enhance the nephrotoxic effect of Triamterene. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Test InteractionsInterferes with fluorometric assay of quinidine

Monitoring ParametersBlood pressure, serum electrolytes (especially potassium), renal function, weight, I & O

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 50 mg, 100 mg [contains benzyl alcohol]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Dyrenium)

50 mg (30): $41.99

100 mg (30): $64.04

Mechanism of ActionInterferes with potassium/sodium exchange (active transport) in the distal tubule, cortical collecting tubule and collecting duct by inhibiting sodium, potassium-ATPase; decreases calcium excretion; increases magnesium loss

Pharmacodynamics/Kinetics

Onset of action: Diuresis: 2-4 hours

Duration: 7-9 hours

Absorption: Unreliable

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness or dizziness

Mental Health: Effects on Psychiatric Treatment Triamterene may increase the side effects of amantadine (dizziness, nausea, dry mouth) necessitating a decrease in dosage; monitor

Cardiovascular Considerations Triamterene is usually combined with other antihypertensive agents for the treatment of hypertension. Triamterene may cause hyperkalemia, the ECG manifestations of which include peaked T waves, QRS prolongation, and cardiac conduction abnormalities.

Anesthesia and Critical Care Concerns/Other Considerations Abrupt discontinuation of therapy may result in rebound kaliuresis; taper off gradually. Triamterene may cause hyperkalemia particularly in diabetes mellitus and those patients with renal dysfunction.

Triazolam

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Triazolam may be confused with ALPRAZolam

Halcion® may be confused with halcinonide, Haldol®

Pronunciation(trye AY zoe lam)
U.S. Brand NamesHalcion®
Canadian Brand NamesApo-Triazo®; Gen-Triazolam; Halcion®
Pharmacologic CategoryBenzodiazepine
Use: Labeled IndicationsShort-term treatment of insomnia
Use: DentalOral premedication before dental procedures
Dosing: Adults**Note:** Onset of action is rapid, patient should be in bed when taking medication.

Insomnia (short-term): Oral: 0.125-0.25 mg at bedtime (maximum dose: 0.5 mg/day)

Dental (preprocedure): Oral: 0.25 mg taken the evening before oral surgery; or 0.25 mg 1 hour before procedure

Dosing: ElderlyOral: Insomnia (short-term use): Initial: 0.125 mg at bedtime; maximum dose: 0.25 mg/day
Dosing: Hepatic ImpairmentReduce dose or avoid use in cirrhosis.
Administration: OralMay take with food. Tablet may be crushed or swallowed whole. Onset of action is rapid, patient should be in bed when taking medication.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
RestrictionsC-IV

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to triazolam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); concurrent therapy with itraconazole, ketoconazole, nefazodone, and other moderate/strong CYP3A4 inhibitors; pregnancy
Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory compromise, COPD or sleep apnea.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.

- Hypnotic: Appropriate use: Should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness. A worsening of insomnia or the emergence of new abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation. Prescription should be written for a maximum of 7-10 days and should not be prescribed in quantities exceeding a 1-month supply.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy. An increase in daytime anxiety may occur after as few as 10 days of continuous use, which may be related to withdrawal reaction in some patients.

Geriatric ConsiderationsDue to the higher incidence of CNS adverse reactions and its short half-life, this benzodiazepine is not a drug of first choice. For short-term only.

Pregnancy Risk FactorX

Pregnancy ConsiderationsOther benzodiazepines are known to cross the placenta and accumulate in the fetus. Teratogenic effects have been reported. Use of triazolam is contraindicated in pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if triazolam is excreted in breast milk; however, other benzodiazepines are known to be excreted in breast milk. The AAP rates use of related agents as “of concern” and breast-feeding is not recommended.

Adverse Reactions

>10%: Central nervous system: Drowsiness (14%)

1% to 10%:

Central nervous system: Headache (10%), dizziness (8%), nervousness (5%), lightheadedness (5%), ataxia (5%)

Gastrointestinal: Nausea (5%), vomiting (5%)

<1%, postmarketing, and/or case reports: Anaphylaxis, angioedema, anterograde amnesia; complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls); confusion, cramps, depression, dermatitis, dreaming/nightmares, dysesthesia, euphoria, fatigue, memory impairment, pain, paresthesia, tachycardia, visual disturbance, weakness, xerostomia

In addition, the following have been reported in association with triazolam and other benzodiazepines: Chest pain, dysarthria, libido changes; paradoxical reactions (eg, mania, sleep disturbances, hallucination, delusions, aggressiveness, falling, syncope); sedation, slurred speech

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (weak), 2C9 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Efavirenz: May increase the serum concentration of Triazolam. *Risk X: Avoid combination*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food may decrease the rate of absorption. Benzodiazepine serum concentrations may be increased by grapefruit juice; monitor.

Herb/Nutraceutical: St John's wort may decrease levels/effects of benzodiazepines. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. Be alert to possibility of anaphylaxis any time during therapy. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for CNS depression. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use.

Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Do not use alcohol or other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, memory impairment; confusion; depression; increased sedation; excitation; headache; agitation; insomnia or nightmares; dizziness; fatigue; impaired coordination; changes in personality, behavior, or cognition); changes in urinary pattern; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; chest pain, palpitations, or rapid heartbeat; unusual swelling, especially on face or neck; excessive perspiration; excessive GI symptoms (cramping, constipation, vomiting, anorexia); or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 0.125 mg, 0.25 mg

Halcion®: 0.125 mg [DSC], 0.25 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Halcion)

0.125 mg (30): $41.99

0.25 mg (30): $57.99

Tablets (Triazolam)

0.125 mg (30): $18.99

0.25 mg (30): $17.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: Hypnotic: 15-30 minutes

Duration: 6-7 hours

Distribution: V_d: 0.8-1.8 L/kg

Protein binding: 89%

Metabolism: Extensively hepatic

Half-life elimination: 1.5-5.5 hours

Excretion: Urine as unchanged drug and metabolites

Dental Health Professional ConsiderationsTriazolam (0.25 mg) 1 hour prior to dental procedure has been used as an oral preop sedative.

Triazolam is a benzodiazepine and is being used in dentistry as a preprocedural oral sedative. There has been recent interest in its use as an orally titratable sedative to render anxious patients at ease during difficult dental procedures. This technique has been referred to as enteral conscious sedation (ECS) and oral conscious sedation (OCS).

Triazolam has the shortest half-life of all the orally administered benzodiazepines. Although midazolam is shorter, it is used parenterally, not orally. The relatively fast onset of action (15-30 minutes) of triazolam offers an advantage in its use as an oral sedative. The clinician is reminded that no kinetic data has been reported with multiple titration doses of triazolam, a technique often used in the ECS/OCS regimen.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Triazolam is a short half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other Considerations Chronic use of this agent may increase the perioperative benzodiazepine dose needed to achieve desired effect. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Triclosan and Fluoride

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(trye KLOE san & FLOR ide)

U.S. Brand NamesColgate Total®

Pharmacologic Category[Antibacterial, Dental]; [Mineral, Oral, Topical]

Use: Labeled IndicationsUsed exclusively in dental applications

Use: DentalAnticavity, antigingivitis, antiplaque toothpaste

Dosing: Adults**Prevention of dental caries and gingivitis:** Oral: Brush teeth thoroughly after each meal or at least twice daily

Dosing: ElderlyRefer to adult dosing.

Warnings/Precautions

Special populations:

- Pediatrics: Antigingivitis and antiplaque effects have not been determined in children <6 years of age.

Other warnings/precautions:

- Accidental ingestion: If an amount greater than used for brushing is swallowed, seek professional assistance of contact a poison control center immediately.

Pregnancy Risk FactorNo data reported

Adverse ReactionsNo data reported

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, oral [toothpaste]: Triclosan 0.30% and sodium fluoride 0.24% (119 g, 170 g, 221 g)

Paste, oral [toothpaste]: Triclosan 0.30% and sodium fluoride 0.24% (119 g, 170 g, 221 g)

Generic AvailableNo

Mechanism of ActionTriclosan is an antibacterial agent which helps to prevent gingivitis with regular use. Fluoride promotes remineralization of decalcified enamel, inhibits the cariogenic microbial process in dental plaque, and increases tooth resistance to acid dissolution

Dental Health Professional ConsiderationsIt has been shown that stannous fluoride and triclosan when formulated into a toothpaste vehicle provide plaque inhibitory effects. To provide a longer retention time of the triclosan in plaque, a polymer has been added to the toothpaste vehicle. The polymer is known as PVM/MA which stands for polyvinylmethyl ether/maleic acid copolymer, and is listed as an inactive ingredient (PVM/MA Copolymer) on the manufacturer's label. Studies have reported that the retention of triclosan in plaque (exceeding the minimal inhibitory concentration) after polymer application was 14 hours after brushing. Ongoing studies are evaluating the effects of triclosan/copolymer on alveolar bone loss. Rosling et al. have reported that the daily use of Colgate Total® reduced (1) the frequency of deep periodontal pockets and (2) the number of sites that exhibited additional probing attachment and bone loss.

Medication Safety Issues

Sound-alike/look-alike issues:

Trientine may be confused with Trental®, tretinoin

Pronunciation(TRYE en teen)
U.S. Brand NamesSyprine®
Canadian Brand NamesSyprine®
Pharmacologic CategoryChelating Agent
Use: Labeled IndicationsTreatment of Wilson's disease in patients intolerant to penicillamine
Dosing: Adults**Wilson's disease:** Oral (administer on an empty stomach): 750-1250 mg/day in divided doses 2-4 times/day; maximum dose: 2 g/day. The practice guideline suggests typical doses of 750-1500 mg/day in 2-3 divided doses with maintenance therapy of 750-1000 mg/day (Roberts, 2003)
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Wilson's disease:** Oral (administer on an empty stomach):

Children <12 years: 500-750 mg/day in divided doses 2-4 times/day; maximum: 1.5 g/day. The practice guideline suggests 20 mg/kg/day rounded off to the nearest 250 mg, given in 2-3 divided doses (Roberts, 2003).

Children ≥12 years: Refer to adult dosing.

Administration: OralDo not chew capsule, swallow whole followed by a full glass of water. Notify healthcare provider of any fever or skin changes. Any skin exposed to the contents of a capsule should be promptly washed with water.
Dietary ConsiderationsShould be taken 1 hour before or 2 hours after meals and at least 1 hour apart from any drug, food, or milk.
StorageStore at 2°C to 8°C (36°F to 46°F).
ContraindicationsHypersensitivity to trientine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anemia: May cause iron-deficiency anemia; monitor closely.
- Copper deficiency: Induced by treatment; may lead to hepatic iron overload and/or sideroblastic anemia; reassess dose.
- Neurologic worsening: May occur with treatment initiation; less common than with penicillamine.

Other warnings/precautions:

- Hypersensitivity: Not reported with use; however, industrial workers exposed to trientine for prolonged periods have reported asthma, bronchitis, and dermatitis.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Central nervous system: Dystonia, malaise

Dermatologic: Rash, thickening and fissuring of skin

Endocrine & metabolic: Iron deficiency

Gastrointestinal: Abdominal pain, anorexia, aphthoid ulcer, colitis, epigastric pain, gastritis, heartburn, loss of taste

Hematologic: Aplastic anemia (rare), anemia, sideroblastic anemia (reversible)

Hepatic: Iron overload

Local: Tenderness

Neuromuscular & skeletal: Muscle cramps, muscle pain, muscular spasm, myasthenia gravis, rhabdomyolysis, weakness

Miscellaneous: Fixed drug eruption, lupus-like reactions

Drug Interactions

Antacids: May decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitor Diuretics: May decrease the serum concentration of Trientine. *Risk C: Monitor therapy*

Iron Salts: Trientine may decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Magnesium Salts: Trientine may decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Zinc Salts: Trientine may decrease the serum concentration of Zinc Salts. Zinc Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Monitoring ParametersPeriodic 24-hour urinary copper assessment (every 6-12 months); free serum copper level

Reference RangeUrinary copper excretion: 200-500 mcg (3-8 micromoles)/day

Monitoring: Lab TestsPeriodic 24-hour urinary copper assessment (every 6-12 months); free serum copper level

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 250 mg

Generic AvailableNo

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Capsules (Syprine)

250 mg (100): $445.99

Mechanism of ActionTrientine hydrochloride is an oral chelating agent structurally dissimilar from penicillamine and other available chelating agents; an effective oral chelator of copper used to induce adequate cupriuresis

Pharmacodynamics/Kinetics

Absorption: Poor

Metabolism: To acetyltrien (chelating activity significantly less than parent)

Excretion: Urine (1% as parent; 8% as metabolite)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Trifluoperazine may be confused with triflupromazine, trihexyphenidyl

Stelazine® may be confused with selegiline

Pronunciation(trye floo oh PER a zeen)

Canadian Brand NamesApo-Trifluoperazine®; Novo-Trifluzine; PMS-Trifluoperazine; Terfluzine

Pharmacologic CategoryAntipsychotic Agent, Typical, Phenothiazine

Use: Labeled IndicationsTreatment of schizophrenia

Use: Unlabeled/InvestigationalManagement of psychotic disorders; behavioral symptoms associated with dementia behavior (elderly); psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Schizophrenia/psychoses: Oral:

Outpatients: 1-2 mg twice daily

Hospitalized or well supervised patient: Initial: 2-5 mg twice daily with optimum response in the 15-20 mg/day range; do not exceed 40 mg/day.

Nonpsychotic anxiety: Oral: 1-2 mg twice daily; maximum: 6 mg/day; therapy for anxiety should not exceed 12 weeks; do not exceed 6 mg/day for longer than 12 weeks when treating anxiety; agitation, jitteriness, or insomnia may be confused with original neurotic or psychotic symptoms.

Dosing: Elderly

Schizophrenia/psychoses: Oral: Refer to adult dosing. Dose selection should start at the low end of the dosage range and titration must be gradual.

Behavioral symptoms associated with dementia behavior (unlabeled use): Oral: Initial: 0.5-1 mg 1-2 times/day; increase dose at 4- to 7-day intervals by 0.5-1 mg/day; increase dosing intervals (bid, tid, etc) as necessary to control response or side effects. Maximum daily dose: 40 mg. Gradual increases (titration) may prevent some side effects or decrease their severity.

Dosing: Pediatric**Schizophrenia/psychoses:** Children 6-12 years: Oral: Hospitalized or well supervised patients: Initial: 1 mg 1-2 times/day, gradually increase until symptoms are controlled or adverse effects become troublesome; maximum: 15 mg/day.

Dosing: Renal ImpairmentNot dialyzable (0% to 5%)

Dietary ConsiderationsMay be taken with food to decrease GI distress.

ContraindicationsHypersensitivity to trifluoperazine or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; bone marrow suppression; blood dyscrasias; severe hepatic disease; coma

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other antipsychotics, trifluoperazine has a low potency of cholinergic blockade.
- Blood dyscrasias: Check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).
- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.
- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Pigmentary retinopathy: May be associated with pigmentary retinopathy.
- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.
- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Trifluoperazine is not approved for this indication.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.
- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Geriatric ConsiderationsElderly are more susceptible to hypotension and neuromuscular reactions.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

Any changes in disease status in any organ system can result in behavior changes.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, orthostatic hypotension, cardiac arrest

Central nervous system: Extrapyramidal symptoms (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia), dizziness, headache, neuroleptic malignant syndrome (NMS), impairment of temperature regulation, lowering of seizure threshold

Dermatologic: Increased sensitivity to sun, rash, discoloration of skin (blue-gray), photosensitivity

Endocrine & metabolic: Changes in menstrual cycle, libido (changes in), breast pain, hyperglycemia, hypoglycemia, gynecomastia, lactation, galactorrhea

Gastrointestinal: Constipation, weight gain, nausea, vomiting, stomach pain, xerostomia

Genitourinary: Difficulty in urination, ejaculatory disturbances, urinary retention, priapism

Hematologic: Agranulocytosis, leukopenia, pancytopenia, thrombocytopenic purpura, eosinophilia, hemolytic anemia, aplastic anemia

Hepatic: Cholestatic jaundice, hepatotoxicity

Neuromuscular & skeletal: Tremor

Ocular: Pigmentary retinopathy, cornea and lens changes

Respiratory: Nasal congestion

Metabolism/Transport Effects**Substrate** of CYP1A2 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression). Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsFalse-positive for phenylketonuria

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS)

Reference RangeTherapeutic response and blood levels have not been established

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Review ophthalmic exam and monitor laboratory results, therapeutic effectiveness (according to rationale for therapy), and adverse reactions at beginning of therapy and periodically with long-term use. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab Tests Lipid profile, fasting blood glucose, Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. Do not discontinue without consulting prescriber. Tablets may be taken with food. Do not take within 2 hours of any antacid. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness, lightheadedness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); ejaculatory dysfunction (reversible); decreased perspiration (avoid strenuous exercise in hot environments); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; altered menstrual pattern, changes in libido, swelling or pain in breasts (male or female); vision changes; skin rash, irritation, or changes in color of skin (gray-blue); or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 1 mg, 2 mg, 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Trifluoperazine HCl)

1 mg (60): $25.97

2 mg (60): $29.99

5 mg (60): $34.99

10 mg (60): $46.99

Mechanism of ActionTrifluoperazine is a piperazine phenothiazine antipsychotic which blocks postsynaptic mesolimbic dopaminergic receptors in the brain; exhibits alpha-adrenergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones

Pharmacodynamics/Kinetics

Metabolism: Extensively hepatic

Half-life elimination: >24 hours with chronic use

Related Information

- Antipsychotic Agents
- CMS: Long-Term Care Facility Thresholds
- Liquid Compatibility

Pharmacotherapy PearlsDo not exceed 6 mg/day for longer than 12 weeks when treating anxiety. Agitation, jitteriness, or insomnia may be confused with original neurotic or psychotic symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension. Xerostomia (normal salivary flow resumes upon discontinuation).

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure.

Mental Health CommentOlder antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsDo not exceed 6 mg/day for >12 weeks when treating anxiety; agitation, jitteriness or insomnia may be confused with original neurotic or psychotic symptoms.

Medication Safety Issues

Sound-alike/look-alike issues:

Viroptic® may be confused with Timoptic®

Pronunciation(trye FLURE i deen)
U.S. Brand NamesViroptic®
Canadian Brand NamesSAB-Trifluridine; Sandoz-Trifluridine; Viroptic®
Pharmacologic CategoryAntiviral Agent, Ophthalmic
Use: Labeled IndicationsTreatment of primary keratoconjunctivitis and recurrent epithelial keratitis caused by herpes simplex virus types I and II
Dosing: Adults**Herpes keratoconjunctivitis, keratitis:** Ophthalmic: Instill 1 drop into affected eye every 2 hours while awake, to a maximum of 9 drops/day, until re-epithelialization of corneal ulcer occurs. Then use 1 drop every 4 hours for another 7 days. Do **not** exceed 21 days of treatment. If improvement has not taken place in 7-14 days, consider another form of therapy.
Dosing: ElderlyRefer to adult dosing.
StorageRefrigerate at 2°C to 8°C (36°F to 46°F). Storage at room temperature may result in a solution altered pH which could result in ocular discomfort upon administration and/or decreased potency.
ContraindicationsHypersensitivity to trifluridine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Mild local irritation of conjunctival and cornea may occur when instilled but usually transient effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Geriatric ConsiderationsAssess ability to self-administer.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse Reactions

1% to 10%: Local: Burning, stinging

<1%: Hyperemia, palpebral edema, epithelial keratopathy, keratitis, stromal edema, increased intraocular pressure, hypersensitivity reactions

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersOphthalmologic exam (test for corneal staining with fluorescein or rose bengal)
Nursing: Physical Assessment/MonitoringMonitor effectiveness of therapy, not for long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationFor ophthalmic use only. Store in refrigerator; do not use discolored solution. Apply prescribed amount as often as directed. Wash hands before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Tilt head back and look upward. Gently pull down lower lid and put drop(s) in inner corner of eye. Close eye and roll eyeball in all directions. Do not blink for $^1/_2$ minute. Apply gentle pressure to inner corner of eye for 30 seconds. Wipe away excess from skin around eye. Do not use any other eye preparation for at least 10 minutes. Do not share medication with anyone else. May cause sensitivity to bright light (dark glasses may help); or temporary stinging or blurred vision may occur. Inform prescriber if you experience eye pain, redness, burning, watering, dryness, double vision, puffiness around eye, vision changes, or other adverse eye response; or worsening of condition or lack of improvement within 7-14 days. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: 1% (7.5 mL)

Viroptic®: 1% (7.5 mL)

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Solution (Trifluridine)

1% (7.5): $117.75

Solution (Viroptic)

1% (7.5): $127.52

Mechanism of Action Interferes with viral replication by incorporating into viral DNA in place of thymidine, inhibiting thymidylate synthetase resulting in the formation of defective proteins

Pharmacodynamics/Kinetics Absorption: Ophthalmic: Systemic absorption negligible, corneal penetration adequate

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Medication Safety Issues

Sound-alike/look-alike issues:

Trihexyphenidyl may be confused with trifluoperazine

Artane may be confused with Altace®, Anturane®, Aramine®

Pronunciation(trye heks ee FEN i dil)

Canadian Brand NamesApo-Trihex®

Pharmacologic CategoryAnti-Parkinson's Agent, Anticholinergic; Anticholinergic Agent

Use: Labeled IndicationsAdjunctive treatment of Parkinson's disease; treatment of drug-induced extrapyramidal symptoms

Dosing: Adults**Parkinson's disease or drug-induced EPS:** Oral: Initial: 1-2 mg/day, increase by 2 mg increments at intervals of 3-5 days; usual dose: 5-15 mg/day in 3-4 divided doses

Dosing: ElderlyParkinsonism: Oral: 1 mg on first day, increase by 2 mg every 3-5 days as needed until a total of 6-10 mg/day (in 3-4 divided doses) is reached. If the patient is on concomitant levodopa therapy, the daily dose is reduced to 1-2 mg 3 times/day. Avoid use if possible (see Geriatric Considerations).

Administration: OralTolerated best if given in 3 daily doses and with food. High doses may be divided into 4 doses, at meal times and at bedtime. Patients may be switched to sustained-action capsules when stabilized on conventional dosage forms.

ContraindicationsHypersensitivity to trihexyphenidyl or any component of the formulation; narrow-angle glaucoma; pyloric or duodenal obstruction; stenosing peptic ulcers; bladder neck obstructions; achalasia; myasthenia gravis

Warnings/Precautions

Concerns related to adverse effects:

- Anhidrosis/hyperthermia: May cause anhidrosis and hyperthermia, which may be severe; use with caution in hot weather or during exercise, especially when administered concomitantly with other atropine-like drugs to chronically-ill patients, alcoholics, patients with CNS disease, or persons doing manual labor in a hot environment.
- Weakness: When given in large doses or to susceptible patients, may cause weakness and inability to move particular muscle groups.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with tachycardia, cardiac arrhythmias, hypertension, or hypotension.
- GI obstruction: Use with caution in patients with obstructive disease of the GI.
- Glaucoma: Use with caution in patients with glaucoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Mental illness: May exacerbate mental symptoms when used to treat extrapyramidal symptoms.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture or retention.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Frequently develop increased sensitivity and require strict dosage regulation; side effects may be more severe in elderly patients with atherosclerotic changes.

Other warnings/precautions:

- Tardive dyskinesia: Does not relieve symptoms of tardive dyskinesia.

Geriatric ConsiderationsAnticholinergic agents are generally not well tolerated in the elderly (eg, confusion, constipation, urinary retention) and their use should be avoided when possible. In elderly, anticholinergic agents should not be used as prophylaxis against extrapyramidal symptoms.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsAnticholinergic agents may suppress lactation.

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia

Central nervous system: Confusion, agitation, euphoria, drowsiness, headache, dizziness, nervousness, delusions, hallucinations, paranoia

Dermatologic: Dry skin, increased sensitivity to light, rash

Gastrointestinal: Constipation, xerostomia, dry throat, ileus, nausea, vomiting, parotitis

Genitourinary: Urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, mydriasis, increase in intraocular pressure, glaucoma, blindness (long-term use in narrow-angle glaucoma)

Respiratory: Dry nose

Miscellaneous: Diaphoresis (decreased)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersIOP monitoring and gonioscopic evaluations should be performed periodically

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor renal function, therapeutic effectiveness, and adverse reactions (eg, anticholinergic syndrome) at beginning of therapy and periodically throughout therapy. Intraocular pressure monitoring and gonioscopic evaluations should be performed periodically. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; with meals if GI upset occurs, before meals if dry mouth occurs, after eating if drooling or if nausea occurs. Take at the same time each day. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake; void before taking medication. Do not use alcohol and all prescription or OTC sedatives or CNS depressants without consulting prescriber. You may experience drowsiness, confusion, or vision changes (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); increased susceptibility to heat stroke, decreased perspiration (use caution in hot weather; maintain adequate fluids and reduce exercise activity); constipation (increased exercise, fluids, fruit, or fiber may help); or dry skin or nasal passages (consult prescriber for appropriate relief). Report unresolved constipation; chest pain or palpitations; respiratory difficulty; CNS changes (hallucination, loss of memory, nervousness, etc); painful or difficult urination; increased muscle spasticity or rigidity; skin rash; or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir, as hydrochloride: 2 mg/5 mL (480 mL)

Tablet, as hydrochloride: 2 mg, 5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Trihexyphenidyl HCl)

2 mg (90): $22.99

5 mg (180): $65.99

Mechanism of ActionExerts a direct inhibitory effect on the parasympathetic nervous system. It also has a relaxing effect on smooth musculature; exerted both directly on the muscle itself and indirectly through parasympathetic nervous system (inhibitory effect)

Pharmacodynamics/Kinetics

Onset of action: Peak effect: ~1 hour

Half-life elimination: 3.3-4.1 hours

Time to peak, serum: 1-1.5 hours

Excretion: Primarily urine

Related Information

- Antiparkinsonian Agents
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsIncidence and severity of side effects are dose related. Patients may be switched to sustained-action capsules when stabilized on conventional dosage forms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia, dry throat (normal salivary flow resumes upon discontinuation). Prolonged xerostomia may contribute to discomfort and dental disease (ie, caries, periodontal disease, and oral candidiasis).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentThis agent should not be used for an acute dystonic reaction. No injectable dosage form is available. However, oral dosage forms may be utilized to treat akathisia and pseudoparkinsonism. It is considered to be the least sedating antihistamine used to treat drug-induced EPS.

Index TermsArtane; Benzhexol Hydrochloride; Trihexyphenidyl Hydrochloride

Trimebutine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(trye me BYOO teen)
Canadian Brand NamesApo-Trimebutine®; Modulon®
Pharmacologic Category5-HT_3 Receptor Antagonist
Use: Labeled IndicationsTreatment and relief of symptoms associated with irritable bowel syndrome (IBS) (spastic colon). In postoperative paralytic ileus in order to accelerate the resumption of the intestinal transit following abdominal surgery.
Dosing: Adults**Irritable bowel syndrome (IBS):** Oral: 200 mg 3 times/day before meals
Dosing: PediatricChildren ≥12 years: Refer to adult dosing.
Administration: OralAdminister before meals.
Dietary ConsiderationsShould be taken before meals.
StorageStore at room temperature of 15°C to 30°C.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to trimebutine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness; use with caution in patients with CNS depression. Advise patient to avoid operating machinery/driving until response is known.

Concurrent drug therapy issues:

- Sedatives: May increase sedation from CNS depressants and/or ethanol.

Special populations:

- Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorNot assigned; not recommended per manufacturer
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use in pregnancy is not recommended per manufacturer.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsMild to moderate effects in 7% of patients.

Central nervous system: Anxiety, drowsiness, dizziness, fatigue, headache

Dermatologic: Rash (0.4%)

Endocrine & metabolic: Gynecomastia, mastalgia, menstrual disorder

Gastrointestinal: Constipation, diarrhea, dyspepsia, epigastric discomfort, nausea, taste disorder, xerostomia

Genitourinary: Urinary retention

Otic: Hearing impairment

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsEthanol: Avoid use (may increase risk of sedation).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as maleate: 100 mg, 200 mg

Generic AvailableNo
ManufacturerAxcan (Canada)
Mechanism of ActionSpasmolytic agent with antiserotonergic activity and moderate opiate receptor affinity. Reduces abnormal motility; does not alter normal GI motility.
Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness, anxiety, dizziness, or fatigue
Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropic agents may produce additive sedative effects.
Index TermsTrimebutine Maleate

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tigan® may be confused with Tiazac®, Ticar®, Ticlid®

Trimethobenzamide may be confused with metoclopramide, trimethoprim

Pronunciation(trye meth oh BEN za mide)
U.S. Brand NamesTigan®
Canadian Brand NamesTigan®
Pharmacologic CategoryAnticholinergic Agent; Antiemetic
Use: Labeled IndicationsTreatment of postoperative nausea and vomiting; treatment of nausea associated with gastroenteritis
Dosing: Adults

Nausea, vomiting:

Oral: 300 mg 3-4 times/day

I.M.: 200 mg 3-4 times/day

Postoperative nausea and vomiting (PONV): I.M.: 200 mg, followed 1 hour later by a second 200 mg dose

Dosing: ElderlyRefer to adult dosing. Consider dosage reduction or increasing dosing interval in elderly patients with renal impairment (specific adjustment guidelines are not provided in the manufacturer's labeling).
Dosing: Pediatric**Nausea, vomiting:** Children >40 kg: Oral: Refer to adult dosing. (Injection is contraindicated in children.)
Dosing: Renal ImpairmentCl_{cr} ≤70 mL/minute: Consider dosage reduction or increasing dosing interval (specific adjustment guidelines are not provided in the manufacturer's labeling)
Administration: I.M.Injection: Administer I.M. only. Inject deep into upper outer quadrant of gluteal muscle.
Administration: I.V.Injection: Not for I.V. administration.
Administration: I.V. DetailpH: 5
Administration: OralCapsule: Administer capsule orally without regard to meals.
StorageStore capsules and injection solution at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
Compatibility

Compatibility in syringe: Compatible: Glycopyrrolate, hydromorphone, midazolam, nalbuphine.

ContraindicationsHypersensitivity to trimethobenzamide or any component of the formulation; injection contraindicated in children
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: The risk of CNS adverse effects (eg, coma, EPS, seizure) may be increased in patients with acute febrile illness, dehydration, electrolyte imbalance, encephalitis, and gastroenteritis; use with caution. May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Extrapyramidal symptoms: May cause extrapyramidal symptoms (EPS) which may be confused with CNS symptoms of primary disease responsible for emesis.

- Skin reactions: Allergic-type skin reactions have been reported with use; discontinue with signs of sensitization.

Disease-related concerns:

- Renal impairment: Trimethobenzamide clearance is predominantly renal; consider dosage reductions.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Use capsule formulation with caution in children; antiemetics are not recommended for uncomplicated vomiting in children, limit antiemetic use to prolonged vomiting of known etiology. Use of injection is contraindicated in children.

Geriatric ConsiderationsNo specific data for use in the elderly have been established; as with any drug which has EPS adverse effects and possibility of confusion, caution should be used when administering to elderly.

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Safety and efficacy have not been established in pregnant patients. Trimethobenzamide has been used to treat nausea and vomiting of pregnancy.

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension (I.V. administration)

Central nervous system: Coma, depression, disorientation, dizziness, drowsiness, EPS, headache, Parkinson-like symptoms, seizure

Dermatologic: Allergic-type skin reactions

Gastrointestinal: Diarrhea

Hematologic: Blood dyscrasias

Hepatic: Jaundice

Local: Injection site burning, pain, redness, stinging, or swelling

Neuromuscular & skeletal: Muscle cramps, opisthotonos

Ocular: Blurred vision

Miscellaneous: Hypersensitivity reactions

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Concomitant use should be avoided (sedative effects may be additive).

Monitoring ParametersRenal function (at baseline)

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness, and adverse reactions with first dose and on a regular basis during therapy (eg, hypovolemia, angioedema, postural hypotension). Teach patient appropriate use (if self-administered injection, teach injection technique and syringe disposal), possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal function (at baseline)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take capsule as directed before meals; do not increase dose and do not discontinue without consulting prescriber. If using injection formulation, follow directions for injection and disposal of syringe. May cause drowsiness or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known) or diarrhea (buttermilk or yogurt may help). Report chest pain or palpitations, persistent dizziness or blurred vision, or CNS changes (disorientation, depression, confusion). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 300 mg

Tigan®: 300 mg

Injection, solution, as hydrochloride: 100 mg/mL (2 mL)

Tigan®: 100 mg/mL (20 mL)

Injection, solution, as hydrochloride [preservative free]:

Tigan®: 100 mg/mL (2 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Tigan)

300 mg (30): $50.49

Capsules (Trimethobenzamide HCl)

300 mg (30): $39.99

Mechanism of ActionActs centrally to inhibit the medullary chemoreceptor trigger zone by blocking emetic impulses to the vomiting center

Pharmacodynamics/Kinetics

Onset of action: Antiemetic: Oral: 10-40 minutes; I.M.: 15-35 minutes

Duration: 3-4 hours

Metabolism: Via oxidation, forms metabolite trimethobenzamide N-oxide

Bioavailability: Oral: 60% to 100%

Half-life elimination: 7-9 hours

Time to peak: Oral: ~45 minutes; I.M.: ~30 minutes

Excretion: Urine (30% to 50%, as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause dizziness; may rarely cause depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Index TermsTrimethobenzamide Hydrochloride

Trimethoprim and Polymyxin B

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(trye METH oh prim & pol i MIKS in bee)
U.S. Brand NamesPolytrimÂŽ
Canadian Brand NamesPMS-Polytrimethoprim; Polytrimâ˘
Pharmacologic CategoryAntibiotic, Ophthalmic
Use: Labeled IndicationsTreatment of surface ocular bacterial conjunctivitis and blepharoconjunctivitis
Dosing: Adults**Conjunctivitis, blepharoconjunctivitis:** Ophthalmic: Instill 1-2 drops in eye(s) every 4-6 hours
Dosing: ElderlyRefer to adult dosing.
Administration: OtherAvoid contamination of the applicator tip.
ContraindicationsHypersensitivity to trimethoprim, polymyxin B, or any component of the formulation
Warnings/PrecautionsSee individual agents.
Pregnancy Risk FactorC
Adverse Reactions1% to 10%: Local: Burning, stinging, itching, increased redness
Metabolism/Transport EffectsTrimethoprim: **Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP2C8 (moderate), 2C9 (moderate)
Drug Interactions

ACE Inhibitors: Trimethoprim may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amantadine: Trimethoprim may enhance the adverse/toxic effect of Amantadine. Specifically, the risk of myoclonus and/or delerium may be increased. Amantadine may increase the serum concentration of Trimethoprim. Trimethoprim may increase the serum concentration of Amantadine. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Trimethoprim may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Antidiabetic Agents (Thiazolidinedione): Trimethoprim may decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

AzaTHIOprine: Trimethoprim may enhance the myelosuppressive effect of AzaTHIOprine. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dapsone: Trimethoprim may increase the serum concentration of Dapsone. Dapsone may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dofetilide: Trimethoprim may decrease the excretion of Dofetilide. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

LamiVUDine: Trimethoprim may decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Leucovorin-Levoleucovorin: May diminish the therapeutic effect of Trimethoprim. *Risk D: Consider therapy modification*

Memantine: Trimethoprim may enhance the adverse/toxic effect of Memantine. Specifically, the risk of myoclonus and/or delerium may be increased. Trimethoprim may increase the serum concentration of Memantine. Memantine may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Methotrexate: Trimethoprim may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Phenytoin: Trimethoprim may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procainamide: Trimethoprim may decrease the excretion of Procainamide. *Risk D: Consider therapy modification*

Repaglinide: Trimethoprim may decrease the metabolism of Repaglinide. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: Trimethoprim 1 mg and polymyxin B sulfate 10,000 units per mL (10 mL) [contains benzalkonium chloride]

Generic AvailableYes

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Trimethoprim may be confused with trimethaphan

Proloprim® may be confused with Prolixin®, Protropin®

Pronunciation(trye METH oh prim)

U.S. Brand NamesPrimsol®

Canadian Brand NamesApo-Trimethoprim®

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsTreatment of urinary tract infections due to susceptible strains of *E. coli*, *P. mirabilis*, *K. pneumoniae*, *Enterobacter* sp and coagulase-negative *Staphylococcus* including *S. saprophyticus*; acute otitis media in children; acute exacerbations of chronic bronchitis in adults; in combination with other agents for treatment of toxoplasmosis, *Pneumocystis carinii*; treatment of superficial ocular infections involving the conjunctiva and cornea

Dosing: Adults**Susceptible infections:** Oral: 100 mg every 12 hours or 200 mg every 24 hours for 10 days; longer treatment periods may be necessary for prostatitis (ie, 4-16 weeks)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricOral: Children (>2 months or age): 4 mg/kg/day in divided doses every 12 hours

Dosing: Renal Impairment

Cl_{cr} 15-30 mL/minute: Administer 100 mg every 18 hours or 50 mg every 12 hours.

Cl_{cr} <15 mL/minute: Administer 100 mg every 24 hours or avoid use.

Moderately dialyzable (20% to 50%)

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister with milk or food.

Dietary ConsiderationsMay cause folic acid deficiency, supplements may be needed. Should be taken with milk or food.

StorageProtect the 200 mg tablet from light.

ContraindicationsHypersensitivity to trimethoprim or any component of the formulation; megaloblastic anemia due to folate deficiency

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Patients with potential for folate deficiency: Use with caution in patients with potential folate deficiency (malnourished, chronic anticonvulsant therapy, or elderly).

Geriatric ConsiderationsTrimethoprim is often used in combination with sulfamethoxazole; it can be used alone in patients who are allergic to sulfonamides; adjust dose for renal function (see Pharmacokinetics and Dosage).

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no well-controlled studies on the use of trimethoprim during pregnancy. Because trimethoprim may interfere with folic acid metabolism, consider using only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Adverse ReactionsFrequency not defined.

Central nervous system: Aseptic meningitis (rare), fever

Dermatologic: Maculopapular rash (3% to 7% at 200 mg/day; incidence higher with larger daily doses), erythema multiforme (rare), exfoliative dermatitis (rare), pruritus (common), phototoxic skin eruptions, Stevens-Johnson syndrome (rare), toxic epidermal necrolysis (rare)

Endocrine & metabolic: Hyperkalemia, hyponatremia

Gastrointestinal: Epigastric distress, glossitis, nausea, vomiting

Hematologic: Leukopenia, megaloblastic anemia, methemoglobinemia, neutropenia, thrombocytopenia

Hepatic: Liver enzyme elevation, cholestatic jaundice (rare)

Renal: BUN and creatinine increased

Miscellaneous: Anaphylaxis, hypersensitivity reactions

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP2C8 (moderate), 2C9 (moderate)
Drug Interactions

ACE Inhibitors: Trimethoprim may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amantadine: Trimethoprim may enhance the adverse/toxic effect of Amantadine. Specifically, the risk of myoclonus and/or delerium may be increased. Amantadine may increase the serum concentration of Trimethoprim. Trimethoprim may increase the serum concentration of Amantadine. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Trimethoprim may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Antidiabetic Agents (Thiazolidinedione): Trimethoprim may decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

AzaTHIOprine: Trimethoprim may enhance the myelosuppressive effect of AzaTHIOprine. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dapsone: Trimethoprim may increase the serum concentration of Dapsone. Dapsone may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dofetilide: Trimethoprim may decrease the excretion of Dofetilide. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

LamiVUDine: Trimethoprim may decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Leucovorin-Levoleucovorin: May diminish the therapeutic effect of Trimethoprim. *Risk D: Consider therapy modification*

Memantine: Trimethoprim may enhance the adverse/toxic effect of Memantine. Specifically, the risk of myoclonus and/or delerium may be increased. Trimethoprim may increase the serum concentration of Memantine. Memantine may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Methotrexate: Trimethoprim may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Phenytoin: Trimethoprim may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procainamide: Trimethoprim may decrease the excretion of Procainamide. *Risk D: Consider therapy modification*

Repaglinide: Trimethoprim may decrease the metabolism of Repaglinide. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Reference RangeTherapeutic: Peak: 5-15 mg/L; Trough: 2-8 mg/L
Nursing: Physical Assessment/MonitoringPerform culture and sensitivity prior to initiating therapy. Assess potential for interactions with other pharmacological agents patient may be taking (eg, risk of increased or decreased levels/effects with other medications). Assess results of laboratory tests with long-term therapy. Evaluate therapeutic effectiveness (resolution of infection) and possible adverse reactions. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsPeriodic CBC and serum potassium during long-term therapy. Perform culture and sensitivity prior to initiating therapy.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take per recommended schedule. Complete full course of therapy even if feeling better; do not skip doses. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea, vomiting, or GI upset (small, frequent meals, frequent mouth care, sucking lozenges, or chewing

gum may help). Report skin rash, redness, or irritation; feelings of acute fatigue or weakness; unusual bleeding or bruising; or other persistent adverse effects. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Primsol®: 50 mg (base)/5 mL (473 mL) [dye free, ethanol free; contains propylene glycol, sodium benzoate; bubble gum flavor]

Tablet: 100 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Tablets (Trimethoprim)

100 mg (30): $19.99

Mechanism of ActionInhibits folic acid reduction to tetrahydrofolate, and thereby inhibits microbial growth

Pharmacodynamics/Kinetics

Absorption: Readily and extensive

Distribution: Widely into body tissues and fluids (middle ear, prostate, bile, aqueous humor, CSF); crosses placenta; enters breast milk

Protein binding: 42% to 46%

Metabolism: Partially hepatic

Half-life elimination: 8-14 hours; prolonged with renal impairment

Time to peak, serum: 1-4 hours

Excretion: Urine (60% to 80%) as unchanged drug

Related Information

- Antimicrobial Drugs of Choice

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Glossitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(tri me TREKS ate)

U.S. Brand NamesNeuTrexin® [DSC]

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsAlternative therapy for the treatment of moderate-to-severe *Pneumocystis jiroveci* pneumonia (PCP) in immunocompromised patients, including patients with acquired immunodeficiency syndrome (AIDS), who are intolerant of, or are refractory to, sulfamethoxazole/trimethoprim therapy or for whom sulfamethoxazole/trimethoprim and pentamidine are contraindicated

Use: Unlabeled/InvestigationalTreatment of nonsmall cell lung cancer, metastatic colorectal cancer, metastatic head and neck cancer, pancreatic adenocarcinoma, cutaneous T-cell lymphoma

Dosing: Adults**Note:** Concurrent leucovorin 20 mg/m^2 every 6 hours must be administered daily (oral or I.V.) during treatment and for 72 hours past the last dose of trimetrexate.

Pneumonia caused by*Pneumocystis jiroveci*(PCP): I.V.: 45 mg/m^2 once daily for 21 days; **alternative dosing based on weight:**

<50 kg: Trimetrexate 1.5 mg/kg/day; leucovorin 0.6 mg/kg 4 times/day

50-80 kg:Trimetrexate 1.2 mg/kg/day; leucovorin 0.5 mg/kg/4 times/day

>80 kg: Trimetrexate 1 mg/kg/day; leucovorin 0.5 mg/kg/4 times/day

Note: Oral doses of leucovorin should be rounded up to the next higher 25 mg increment.

Antineoplastic (unlabeled use): I.V.: 6-16 mg/m^2 once daily for 5 days every 21-28 days **or** 150-200 mg/m^2 every 2 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentAlthough it may be necessary to reduce the dose in patients with liver dysfunction, no specific dosage recommendations exist for treatment initiation with hepatic impairment.

Dosing: Adjustment for ToxicityLeucovorin therapy must be extended for 72 hours past the last dose of trimetrexate glucuronate.

Hematologic toxicity: See table.

Dosage Adjustment in Hematologic Toxicity

Toxicity Grade	**Neutrophils (Polys/Bands)**	**Platelets**	**Dosage Recommendations**	
			Trimetrexate	**Leucovorin**
1	>1000/mm^3	>75,000/mm^3	45 mg/m^2 once daily	20 mg/m^2 every 6 h
2	750-1000/mm^3	50,000-75,000/mm^3	45 mg/m^2 once daily	40 mg/m^2 every 6 h
3	500-749/mm^3	25,000-49,999/mm^3	22 mg/m^2 once daily	40 mg/m^2 every 6 h
4	<500/mm^3	<25,000/mm^3	Day 1-9: Discontinue Day 10-21: Interrupt up to 96 hours (see **Note**)	40 mg/m^2 every 6 h
Note:				

If Grade 4 hematologic toxicity occurs prior to day 10: Trimetrexate should be discontinued and leucovorin administered for an additional 72 hours.
If Grade 4 hematologic toxicity occurs at day 10 or later: Trimetrexate may be held up to 96 hours to allow counts to recover.
If counts recover to Grade 3 within 96 hours, trimetrexate should be administered at a dose of 22 mg/m^2 and leucovorin 40 mg/m^2 every 6 hours.
When counts recover to Grade 2 toxicity, trimetrexate may be increased to 45 mg/m^2. Continue leucovorin at 40 mg/m^2 for duration of treatment.
Discontinue trimetrexate if counts do not improve to less than or equal to Grade 3 toxicity within 96 hours. Continue leucovorin at 40 mg/m^2 every 6 hours for 72 hours following last dose.

Hepatic toxicity (during treatment): Hold drug therapy if transaminase levels or alkaline phosphatase levels increase to >5 times the upper limit of normal.

Renal toxicity (during treatment): Hold drug therapy if serum creatinine levels increase to >2.5 mg/dL and elevation is considered secondary to trimetrexate.

Other toxicities: Hold drug therapy in patients experiencing severe mucosal toxicity that interferes with oral intake. Treatment should be discontinued for fever that cannot be controlled with antipyretics (oral temperature ≥40.5°C/105°F).

In addition: If trimetrexate treatment is interrupted for toxicity, leucovorin therapy must continue for 72 hours past the last administered dose of trimetrexate.

Calculations

- Body Surface Area: Adults

Administration: I.V.Infuse over 60-90 minutes.
Administration: I.V. DetailMust be used with concurrent leucovorin; trimetrexate and leucovorin solutions **must** be administered separately. Intravenous lines should be flushed with at least 10 mL of D_5W before and after trimetrexate and between trimetrexate and leucovorin.

pH: 3.5-5.5

StoragePrior to reconstitution, vials should be stored at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light. Reconstituted solution is stable for 6 hours at room temperature and 24 hours under refrigeration. Diluted solutions for infusion are stable under refrigeration or at room temperature for 24 hours. Do not freeze. Precipitate occurs with leucovorin or any solution containing chloride ion.
ReconstitutionReconstitute with D_5W or SWFI to a concentration of 12.5 mg/mL. Do not use if cloudy or if precipitate forms. Prior to administration, solution should be further diluted with D_5W to a concentration of 0.25 mg/mL to 2 mg/mL.
CompatibilityStable in D_5W, sterile water for injection.

Y-site administration: Compatible: Amifostine, zidovudine. **Incompatible:** Foscarnet, indomethacin.

Compatibility when admixed: Incompatible: Chloride-containing solutions, leucovorin.

ContraindicationsHypersensitivity to trimetrexate, methotrexate, leucovorin, or any component of the formulation; severe existing myelosuppression; pregnancy
Allergy Considerations

- Methotrexate/Trimetrexate Allergy

Warnings/Precautions

Boxed warnings:

- Leucovorin: See “Concurrent drug therapy issues” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Hypersensitivity/allergic-type reactions have been reported, primarily when given as a bolus infusion, at higher than recommended doses for PCP, or in combination with fluorouracil or leucovorin. May cause anaphylactoid reactions (rarely) including acute hypotension and loss of consciousness. Epinephrine should be available for treatment of acute allergic symptoms.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with mild myelosuppression.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hypoalbuminemia/hypoproteinemia: Use with caution in patients with hypoalbuminemia or hypoproteinemia.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Leucovorin: **[U.S. Boxed Warning]: Must be administered with concurrent leucovorin to avoid potentially serious or life-threatening toxicities.** Leucovorin therapy must extend for 72 hours past the last dose of trimetrexate.
- Myelosuppressive therapies: Use with caution in patients on previously extensive myelosuppressive therapies.
- Zidovudine: Withhold zidovudine during trimetrexate treatment.

Geriatric ConsiderationsNo specific recommendations are available for the elderly. Use with caution in patients with liver dysfunction (see Dosage).

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects and fetal loss were observed in animal studies. May cause fetal harm when administered to pregnant women. Women of childbearing potential should avoid becoming pregnant while receiving treatment. If used in pregnancy, or if patient becomes pregnant during treatment, the patient should be apprised of potential hazard to the fetus.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is recommended to discontinue breast-feeding during trimetrexate therapy.

Adverse Reactions

>10%:

Hematologic: Neutropenia (30%)

Hepatic: ALT increased (11%), AST increased (14%)

1% to 10%:

Central nervous system: Fever (8%), confusion (3%), fatigue (2%)

Dermatologic: Rash/pruritus (6%)

Endocrine & metabolic: Hyponatremia (5%), hypocalcemia (2%)

Gastrointestinal: Nausea/vomiting (5%), stomatitis

Hematologic: Thrombocytopenia (10%), anemia (7%)

Hepatic: Alkaline phosphatase increased (5%), bilirubin increased (2%)

Neuromuscular & skeletal: Peripheral neuropathy

Miscellaneous: Flu-like illness; hypersensitivity/allergic reactions (chills, rigors); anaphylactoid reactions (acute hypotension, loss of consciousness)

<1%: Seizure, serum creatinine increased

Oncology: VesicantNo

Oncology: Emetic PotentialLow (<10%)

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring ParametersCheck and record patient's temperature daily; absolute neutrophil counts (ANC), platelet count, renal function tests (serum creatinine, BUN), and hepatic function tests (ALT, AST, alkaline phosphatase) twice weekly

Nursing: Physical Assessment/MonitoringTrimetrexate must be administered with concurrent leucovorin to avoid potentially serious or life-threatening toxicities. Leucovorin therapy must extend for 72 hours past the last dose of trimetrexate to reduce potential for life-threatening toxicities. Assess potential for interactions with other pharmacological agents patient may be taking. Patient must be monitored closely for anaphylactoid reactions; epinephrine should be available. Assess results of laboratory tests at baseline and periodically during therapy. Assess therapeutic effectiveness and adverse reactions (eg, rash, gastrointestinal upset, anemia, peripheral neuropathy, increased LFTs). Teach patient importance of maintaining prescribed schedule of leucovorin, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsAbsolute neutrophil counts (ANC), platelet count, renal function tests (serum creatinine, BUN), and hepatic function (ALT, AST, alkaline phosphatase) twice weekly

Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially aspirin or aspirin-containing products). This medication is only administered by intravenous infusion. Report immediately any redness, swelling, or pain at infusion site. This medication is administered concurrently with an oral medication (leucovorin); maintain exact schedule as prescribed for oral medication in order to reduce potential for serious reaction. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake).

You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). Report unusual or persistent fever, chills, or joint pain; persistent gastrointestinal upset; changes in sensorium (eg, confusion, unusual or excessive fatigue); or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication or for 1 month after completing therapy. Consult prescriber for appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution [preservative free]:

NeuTrexin®: 25 mg, 200 mg [DSC]

Generic AvailableNo

Mechanism of ActionTrimetrexate is a folate antimetabolite that inhibits DNA synthesis by inhibition of dihydrofolate reductase (DHFR); DHFR inhibition reduces the formation of reduced folates and thymidylate synthetase, resulting in inhibition of purine and thymidylic acid synthesis.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.62 L/kg

Protein binding: 80% to 90% (concentration dependent)

Metabolism: Extensively hepatic: O-demethylation followed by conjugation to glucuronide or sulfate (major); N-demethylation and oxidation (minor)

Half-life elimination: 9-18 hours (11 hours with leucovorin)

Excretion: Urine (10% to 40% as unchanged drug); feces (<1% to 8%)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsNot a vesicant; methotrexate derivative

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine

Index TermsNSC-352122; Trimetrexate Glucuronate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Trimipramine may be confused with triamterene, trimeprazine

Pronunciation(trye MI pra meen)

U.S. Brand NamesSurmontil®

Canadian Brand NamesApo-Trimip®; Nu-Trimipramine; Rhotrimine®; Surmontil®

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine)

Use: Labeled IndicationsTreatment of depression

Dosing: Adults**Depression:** Oral: 50-150 mg/day as a single bedtime dose up to a maximum of 200 mg/day for outpatients and 300 mg/day for inpatients

Dosing: ElderlyOral: Initial: 25 mg at bedtime; increase by 25 mg/day every 3 days for inpatients and weekly for outpatients, as tolerated, to a maximum of 100 mg/day (see Geriatric Considerations).

StorageSolutions stable at a pH of 4-5. Turns yellowish or reddish on exposure to light. Slight discoloration does not affect potency; marked discoloration is associated with loss of potency. Capsules stable for 3 years following date of manufacture.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to trimipramine, any component of the formulation, or other dibenzodiazepines; use of MAO inhibitors within 14 days; use in a patient during the acute recovery phase of MI

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Trimipramine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Trimipramine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is very high relative to other antidepressants.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is high relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is very high relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is high relative to other antidepressants.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose regulation.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsSimilar to doxepin in its side effect profile; has not been well studied in the elderly; very anticholinergic and, therefore, not considered a drug of first choice in the elderly when selecting an antidepressant. Data from a clinical trial comparing fluoxetine to tricyclics suggest that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular diseases.
Pregnancy Risk FactorC
LactationEnters breast milk/contraindicated
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, heart block, hyper-/hypotension, MI, palpitation, stroke, tachycardia

Central nervous system: Agitation, anxiety, confusion, delirium, delusions, drowsiness, exacerbation of psychosis, hallucinations, headache, insomnia, nervousness, nightmares, restlessness, seizure

Dermatologic: Itching, petechiae, photosensitivity, rash

Endocrine & metabolic: Breast enlargement, galactorrhea, sexual dysfunction, syndrome of inappropriate ADH secretion (SIADH)

Gastrointestinal: Anorexia, constipation, decreased lower esophageal sphincter tone may cause GE reflux, diarrhea, heartburn, increased appetite, nausea, trouble with gums, unpleasant taste, vomiting, weight gain, xerostomia

Genitourinary: Difficult urination, testicular edema, urinary retention

Hematologic: Agranulocytosis, eosinophilia, purpura, thrombocytopenia

Hepatic: Cholestatic jaundice, liver enzymes increased

Neuromuscular & skeletal: Ataxia, extrapyramidal symptoms, incoordination, numbness, paresthesia, peripheral neuropathy, tingling, tremor

Ocular: Blurred vision, disturbances in accommodation, eye pain, increased intraocular pressure, mydriasis

Otic: Tinnitus

Miscellaneous: Allergic reactions

Metabolism/Transport Effects**Substrate** (major) of CYP2C19, 2D6, 3A4
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting).

Exceptions: Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Yohimbine: Tricyclic Antidepressants may increase the serum concentration of Yohimbine. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may inhibit the metabolism of some TCAs and clinical toxicity may result.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersBlood pressure and pulse rate prior to and during initial therapy; evaluate mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); monitor weight; ECG in older adults

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness (according to rationale for therapy), and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for CNS depression, thoughts of suicide. Taper dosage slowly when discontinuing (allow 3-4 weeks between discontinuing Surmontil® and starting another antidepressant). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Take at bedtime. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, altered taste, dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); increased appetite (monitor dietary intake to avoid excess weight gain); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); urinary retention (void before taking medication); or sexual dysfunction (reversible). Report persistent CNS effects (eg, insomnia, restlessness, fatigue, anxiety, impaired cognitive function, seizures, suicide ideation); muscle cramping or tremors; chest pain, palpitations, rapid heartbeat, swelling of extremities, or severe dizziness; unresolved urinary retention; vision changes or eye pain; yellowing of eyes or skin; pale stools/dark urine; suicidal ideation; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 25 mg, 50 mg, 100 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Surmontil)

25 mg (100): $221.57

50 mg (100): $338.11

Capsules (Trimipramine Maleate)

50 mg (90): $282.84

Mechanism of ActionIncreases the synaptic concentration of serotonin and/or norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane

Pharmacodynamics/Kinetics

Distribution: V_d: 17-48 L/kg

Protein binding: 95%; free drug: 3% to 7%

Metabolism: Hepatic; significant first-pass effect

Bioavailability: 18% to 63%

Half-life elimination: 16-40 hours

Excretion: Urine

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsMay cause alterations in bleeding time.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and unpleasant taste. Long-term treatment with TCAs, such as trimipramine, increases the risk of caries by reducing salivation and salivary buffer capacity.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Trimipramine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.
Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Medication Safety Issues

Sound-alike/look-alike issues:

Aprodine® may be confused with Aphrodyne®

Pronunciation(trye PROE li deen & soo doe e FED rin)

U.S. Brand NamesAllerfrim [OTC]; Aprodine® [OTC]; Genac® [OTC]; Silafed® [OTC]; Sudafed® Maximum Strength Sinus Nighttime [OTC] [DSC]; Tri-Sudo® [OTC] [DSC]; Zymine®-D

Canadian Brand NamesActifed®

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of nasal congestion, decongest sinus openings, running nose, sneezing, itching of nose or throat and itchy, watery eyes due to common cold, hay fever, or other upper respiratory allergies

Dosing: Adults**Cold, allergy symptoms:** Oral:

Liquid (Zymine®-D): 5-10 mL every 4-6 hours (maximum pseudoephedrine: 240 mg/24 hours)

Syrup (Allerfrim, Aprodine®): 10 mL every 4-6 hours; do not exceed 4 doses in 24 hours

Tablet (Aprodine®): One tablet every 4-6 hours; do not exceed 4 doses in 24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cold, allergy symptoms:** Oral:

Liquid (Zymine®-D):

Children:

2-4 years: 1.25 mL every 4-6 hours (maximum pseudoephedrine: 60 mg/24 hours)

4-6 years: 2.5 mL every 4-6 hours (maximum pseudoephedrine: 60 mg/24 hours)

6-12 years: 2.5-5 mL every 4-6 hours (maximum pseudoephedrine: 120 mg/24 hours)

Children ≥12 years: Refer to adult dosing.

Syrup (Allerfrim, Aprodine®):

Children 6-12 years: 5 mL every 4-6 hours; do not exceed 4 doses in 24 hours

Children >12 years: Refer to adult dosing.

Tablet (Aprodine®):

Children 6-12 years:$^1/_2$ tablet every 4-6 hours; do not exceed 4 doses in 24 hours

Children >12 years: Refer to adult dosing.

ContraindicationsHypersensitivity to pseudoephedrine or any component of the formulation; MAO therapy, severe hypertension, severe coronary artery disease

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Not for OTC use in children <6 years of age.

Other warnings/precautions:

- Self-medication (OTC use): When used for self medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness or sleeplessness occur.

Geriatric ConsiderationsUse with caution in patients with cardiovascular disease; the anticholinergic action of triprolidine may cause confusion, constipation, or urinary retention in the elderly. Also refer to Pseudoephedrine.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia

Central nervous system: Drowsiness, nervousness, insomnia, transient stimulation, headache, fatigue, dizziness

Respiratory: Thickening of bronchial secretions, pharyngitis

Gastrointestinal: Appetite increase, weight gain, nausea, diarrhea, abdominal pain, xerostomia

Genitourinary: Dysuria

Neuromuscular & skeletal: Arthralgia, weakness

Miscellaneous: Diaphoresis

Metabolism/Transport EffectsTriprolidine: **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Zymine®-D: Triprolidine hydrochloride 1.25 mg and pseudoephedrine hydrochloride 45 mg per 5 mL (480 mL)

Syrup: Triprolidine hydrochloride 1.25 mg and pseudoephedrine hydrochloride 30 mg per 5 mL (120 mL) [DSC]

Allerfrim: Triprolidine hydrochloride 1.25 mg and pseudoephedrine hydrochloride 30 mg per 5 mL (120 mL, 480 mL) [contains sodium benzoate]

Aprodine®: Triprolidine hydrochloride 1.25 mg and pseudoephedrine hydrochloride 30 mg per 5 mL (120 mL)

Silafed®: Triprolidine hydrochloride 1.25 mg and pseudoephedrine hydrochloride 30 mg per 5 mL (120 mL, 240 mL)

Tablet:

Allerfrim, Aprodine®, Genac®, Sudafed® Maximum Strength Sinus Nighttime, Tri-Sudo® [DSC]: Triprolidine hydrochloride 2.5 mg and pseudoephedrine hydrochloride 60 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Allerfrim)

2.5-60 mg (100): $12.99

Mechanism of ActionRefer to Pseudoephedrine monograph

Triprolidine is a member of the propylamine (alkylamine) chemical class of H_1-antagonist antihistamines. As such, it is considered to be relatively less sedating than traditional antihistamines of the ethanolamine, phenothiazine, and ethylenediamine classes of antihistamines. Triprolidine has a shorter half-life and duration of action than most of the other alkylamine antihistamines. Like all H_1-antagonist antihistamines, the mechanism of action of triprolidine is believed to involve competitive blockade of H_1-receptor sites resulting in the inability of histamine to combine with its receptor sites and exert its usual effects on target cells. Antihistamines do not interrupt any effects of histamine which have already occurred. Therefore, these agents are used more successfully in the prevention rather than the treatment of histamine-induced reactions.

Pharmacodynamics/KineticsSee Pseudoephedrine monograph.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation). Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; this may contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness, nervousness, and insomnia are common; may cause dizziness; may rarely cause depression, hallucinations, or paradoxical excitement

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; concurrent use with psychotropics may produce additive sedation

Index TermsPseudoephedrine and Triprolidine

International Brand NamesActifed (AE, AU, BB, BE, BF, BH, BJ, BM, BS, BZ, CI, CY, EE, EG, ET, GH, GM, GN, GY, HK, ID, IL, IQ, IR, JM, JO, KE, KP, KW, LB, LR, LY, MA, ML, MR, MU, MW, MX, MY, NE, NG, NL, OM, PE, PY, QA, SA, SC, SD, SL, SN, SR, SY, TH, TN, TT, TZ, UG, VE, YE, ZA, ZM, ZW); Actifedrin (AR, BR, CN); Actiplex (TH); Beatafed (MY); Becanden (TW); Colfed (BF, BJ, CI, ET, GH, GM, GN, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Consudine (TH); Eugen (TW); Fedac (HK, MY); Hiscifed (TH); Histafed (IL); Histamine-Care (IL); Lapifed (ID); Mecofed (ID); Nasafed (ID); Nostel (ID); Peace (MY, TW); Policolo (TH); Pseudoephedrine T (MY); Tosumin (TW); Trifed (AE, BH, CY, EG, ID, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Triprodine (TH); Unifed (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Valved (ID)

Health Canada: Labeling Changes for OTC Cough and Cold Preparations - December, 2008

Health Canada has issued an advisory to Canadian consumers regarding upcoming labeling changes for the use of over-the-counter (OTC) cough and cold medicines in children. Specific labeling changes as well as other important information may be found at http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_184-eng.php.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Medication Safety Issues

Sound-alike/look-alike issues:

Triacin-C® may be confused with triacetin

Pronunciation(trye PROE li deen, soo doe e FED rin, & KOE deen)

Canadian Brand NamesCoActifed®; Covan®; ratio-Cotridin

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of upper respiratory symptoms and cough

Dosing: Adults**Cold, allergy symptoms:** Oral: 10 mL 4 times/day **or** 1 tablet 4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Cold, allergy symptoms: Oral: Children:

2-6 years: 2.5 mL 4 times/day

7-12 years: 5 mL 4 times/day **or** $^1/_2$ tablet 4 times/day

Children ≥12 years: Refer to adult dosing.

RestrictionsC-V (CDSA-I)

ContraindicationsHypersensitivity to triprolidine, pseudoephedrine, opiates, or any component of the formulation (some formulations contain ethanol); acute respiratory depression; CNS depression or coma; increased intracranial pressure (ICP)/head trauma; convulsive disorder; acute abdomen/obstruction; use of MAO inhibitors within 14 days

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Overdosage: Hallucinations, seizures, CNS depression, and death may occur from overdosage.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease including hypertension, tachycardia, and/or ischemic heart disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Glaucoma: Use with caution in patients with angle-closure glaucoma and/or increased intraocular pressure.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with respiratory diseases including asthma, emphysema, and/or COPD.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in patients >60 years of age; may be more sensitive to adverse effects. Triprolidine may not be considered the antihistamine of choice for prolonged use in the elderly.
- Pediatrics: Not recommended as an antitussive for children <2 years of age. May cause paradoxical excitation in children.

Other warnings/precautions:

- Cough control: Codeine is not recommended for use for cough control in patients with a productive cough.
- Duration of therapy: Avoid prolonged use; generally limited to not more than 5 days.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Sedation, dizziness, drowsiness, increased ICP, lightheadedness, dysphoria, euphoria, headache, agitation, hallucinations, seizure, respiratory depression

Dermatologic: Pruritus, rash

Gastrointestinal: Constipation, nausea, vomiting, anorexia, xerostomia, taste disturbance, biliary tract spasm

Genitourinary: Urinary retention, urinary tract spasm

Neuromuscular & skeletal: Muscle tremor, paresthesia, muscular rigidity (rare)

Ocular: Blurred vision, nystagmus

Miscellaneous: Diaphoresis, physical or psychological dependence with continued use, withdrawal syndrome

Metabolism/Transport Effects

Triprolidine: **Inhibits** CYP2D6 (weak)

Codeine: **Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Syrup:

- CoActifed® [CAN], ratio-Cotridin [CAN]: Triprolidine hydrochloride 2 mg, pseudoephedrine hydrochloride 30 mg, and codeine phosphate 10 mg per 5 mL (100 mL, 2000 mL) [not available in U.S.]
- CoVan® [CAN]: Triprolidine hydrochloride 2 mg, pseudoephedrine hydrochloride 30 mg, and codeine phosphate 10 mg per 5 mL (500 mL) [not available in U.S.]

Tablet:

- CoActifed® [CAN]: Triprolidine hydrochloride 4 mg, pseudoephedrine hydrochloride 60 mg, and codeine phosphate 20 mg (50s) [not available in U.S.]

Generic Available No

Pharmacodynamics/Kinetics See Pseudoephedrine and Codeine monographs.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation) and taste disturbance.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental Status Drowsiness, nervousness, and insomnia are common; may cause dizziness; may rarely cause depression, hallucinations, or paradoxical excitement

Mental Health: Effects on Psychiatric Treatment May see increased toxicity with MAO inhibitors (hypertensive crisis), sympathomimetics, CNS depressants, ethanol (sedation)

Index Terms Codeine, Pseudoephedrine, and Triprolidine; Codeine, Triprolidine, and Pseudoephedrine; Pseudoephedrine, Codeine, and Triprolidine; Pseudoephedrine, Triprolidine, and Codeine; Triprolidine, Codeine, and Pseudoephedrine

International Brand Names Actifed Antitusivo (PE); Actifed Compound (TH); Actifed Compound Linctus (AE, BF, BH, BJ, CI, CY, EG, ET, GH, GM, GN, HK, IQ, IR, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, NE, NG, OM, QA, SA, SC, SD, SL, SN, SY, TZ, UG, YE, ZA, ZM, ZW); CoActifed (CA); Covan (CA); Fedac Compound (HK, MY); ratio-Cotridin (CA)

Use: Labeled IndicationsPalliative treatment of advanced prostate cancer as an alternative to orchiectomy or estrogen administration
Use: Unlabeled/InvestigationalTreatment of endometriosis, growth hormone deficiency, hyperandrogenism, *in vitro* fertilization, ovarian carcinoma, pancreatic carcinoma, precocious puberty, uterine leiomyomata
Dosing: Adults**Advanced prostate carcinoma:**

Trelstar® Depot: 3.75 mg once every 28 days

Trelstar® LA: 11.25 mg once every 84 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentSpecific guidelines are not available.
Dosing: Hepatic ImpairmentSpecific guidelines are not available.
Administration: I.M.Administer by I.M. injection into the buttock; alternate injection sites.
Storage

Trelstar® Depot: Store at 15°C to 30°C (59°F to 86°F).

Trelstar® LA: Store at 20°C to 25°C (68°F to 77°F).

ReconstitutionReconstitute with 2 mL sterile water for injection. Shake well to obtain a uniform suspension.

Debioclip™: Follow manufacturer's instructions for mixing prior to use.

ContraindicationsHypersensitivity to triptorelin or any component of the formulation, other LHRH agonists or LHRH; pregnancy
Allergy Considerations

- GnRH Agonist Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hypersensitivity reactions: Angioedema and anaphylaxis have rarely occurred.
- Pituitary apoplexy: Rare cases of pituitary apoplexy (frequently secondary to pituitary adenoma) have been observed with leuprolide administration (onset from 1 hour to usually <2 weeks); may present as sudden headache, vomiting, visual or mental status changes, and infrequently cardiovascular collapse; immediate medical attention required.
- Spinal cord compression: Cases of spinal cord compression have been reported with LHRH agonists; observe patients with metastatic vertebral lesions closely.
- Tumor flare: Transient increases in testosterone can lead to worsening symptoms (bone pain, hematuria, bladder outlet obstruction) of prostate cancer during the first few weeks of therapy.

Disease-related concerns:

- Urinary tract obstruction: Observe patients with urinary tract obstruction closely.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsSince many elderly men may have hypertension, blood pressure needs be monitored closely for the first 4-8 weeks.
Pregnancy Risk FactorX
Pregnancy ConsiderationsContraindicated in women who are or may become pregnant.
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsAs reported with Trelstar® Depot and Trelstar® LA; frequency of effect may vary by product:

>10%:

Central nervous system: Headache (30% to 60%)

Endocrine & metabolic: Hot flashes (95% to 100%), glucose increased

Hematologic: Hemoglobin decreased, RBC count decreased

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased

Neuromuscular & skeletal: Skeletal pain (12% to 13%)

Renal: BUN increased

1% to 10%:

Cardiovascular: Leg edema (6%), hypertension (4%), chest pain (2%), peripheral edema (1%)

Central nervous system: Dizziness (1% to 3%), pain (2% to 3%), emotional lability (1%), fatigue (2%), insomnia (2%)

Dermatologic: Rash (2%), pruritus (1%)

Endocrine & metabolic: Alkaline phosphatase increased (2%), breast pain (2%), gynecomastia (2%), libido decreased (2%), tumor flare (8%)

Gastrointestinal: Nausea (3%), anorexia (2%), constipation (2%), dyspepsia (2%), vomiting (2%), abdominal pain (1%), diarrhea (1%)

Genitourinary: Dysuria (5%), impotence (2% to 7%), urinary retention (1%), urinary tract infection (1%)

Hematologic: Anemia (1%)

Local: Injection site pain (4%)

Neuromuscular & skeletal: Leg pain (2% to 5%), back pain (3%), arthralgia (2%), leg cramps (2%), myalgia (1%), weakness (1%)

Ocular: Conjunctivitis (1%), eye pain (1%)

Respiratory: Cough (2%), dyspnea (1%), pharyngitis (1%)

Postmarketing and/or case reports: Anaphylaxis, angioedema, hypersensitivity reactions, pituitary apoplexy, spinal cord compression, renal dysfunction

Drug Interactions

Antidiabetic Agents: Luteinizing Hormone-Releasing Hormone Analogs may diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Test InteractionsPituitary-gonadal function may be suppressed with chronic administration and for up to 8 weeks after triptorelin therapy has been discontinued.

Monitoring ParametersSerum testosterone levels, prostate-specific antigen

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness, and adverse response. Teach patient possible side effects/appropriate interventions and adverse symptoms to report. **Pregnancy risk factor X.**

Monitoring: Lab TestsSerum testosterone levels, prostate-specific antigen

Patient EducationThis medication can only be administered by injection. If you have diabetes, may alter blood glucose levels; monitor blood sugar closely. Report swelling, pain, or burning at injection site. May cause disease flare (increased bone pain), blood in urine, or urinary retention during early treatment (usually resolves within 1 week); impotence; or hot flashes (cool cloth on forehead, cool environment, and light, layered clothing may help; contact prescriber if these become intolerable). Report any persistent adverse GI upset; chest pain, rapid heartbeat, or palpations; numbness in extremities; acute headache; alterations in urinary pattern; or other persistent adverse effects. Report immediately sudden headache, severe vomiting, visual or mental status change, and cardiovascular collapse. **Pregnancy/breast-feeding precautions:** This drug will cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Trelstar® Depot: 3.75 mg [contains polylactide-co-glycolide; polysorbate 80]

Trelstar® LA: 11.25 mg [contains polylactide-co-glycolide; polysorbate 80]

Generic AvailableNo

ManufacturerPharmacia

Mechanism of ActionCauses suppression of ovarian and testicular steroidogenesis due to decreased levels of LH and FSH with subsequent decrease in testosterone (male) and estrogen (female) levels. After chronic and continuous administration, usually 2-4 weeks after initiation, a sustained decrease in LH and FSH secretion occurs.

Pharmacodynamics/Kinetics

Absorption: Oral: Not active

Distribution: V_d: 30-33 L

Protein binding: None

Metabolism: Unknown; unlikely to involve CYP; no known metabolites

Half-life elimination: 2.8 ± 1.2 hours

Moderate to severe renal impairment: 6.5-7.7 hours

Hepatic impairment: 7.6 hours

Time to peak: 1-3 hours

Excretion: Urine (42% as intact peptide); hepatic

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, fatigue, emotional lability, or dizziness

Mental Health: Effects on Psychiatric TreatmentContraindicated with dopamine antagonists

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tromethamine may be confused with TrophAmine®

Pronunciation(troe METH a meen)

U.S. Brand NamesTHAM®

Pharmacologic CategoryAlkalinizing Agent, Parenteral

Use: Labeled IndicationsCorrection of metabolic acidosis associated with cardiac bypass surgery or cardiac arrest; to correct excess acidity of stored blood that is preserved with acid citrate dextrose (ACD); indicated in infants needing alkalinization after receiving maximum sodium bicarbonate (8-10 mEq/kg/24 hours)

Dosing: Adults

Note: Dose depends on buffer base deficit; when deficit is known: tromethamine (mL of 0.3 M solution) = body weight (kg) x base deficit (mEq/L) x 1.1

Metabolic acidosis with cardiac arrest:

I.V.: 3.6-10.8 g (111-333 mL); additional amounts may be required to control acidosis after arrest reversed

Open chest: Intraventricular: 2-6 g (62-185 mL). **Note:** Do not inject into cardiac muscle

Acidosis associated with cardiac bypass surgery: I.V.: Average dose: 9 mL/kg (2.7 mEq/kg); 500 mL is adequate for most adults; maximum dose: 500 mg/kg in ≤1 hour

Excess acidity of acid citrate dextrose (ACD) blood in coronary artery surgery: 15-77 mL of 0.3 molar solution added to each 500 mL of blood

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Metabolic acidosis associated with RDS: I.V.: Neonates and Infants: Initial: Approximately 1 mL/kg for each pH unit below 7.4; additional doses determined by changes in PaO_2, pH, and pCO_2; **Note:** Although THAM® solution does not raise pCO_2 when treating metabolic acidosis with concurrent respiratory acidosis, bicarbonate may be preferred because the osmotic effects of THAM® are greater.

Dosing: Renal ImpairmentUse with caution; monitor for toxicity.

Administration: I.V.Maximum concentration: 0.3 molar; infuse slowly over at least 1 hour; to avoid glucose or potassium changes, should not exceed 16.5 mL/kg in 1 hour

Administration: I.V. DetailOsmolality 389 mOsmol/L

pH 8.4-8.7

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from freezing.

ContraindicationsHypersensitivity to tromethamine or any component of the formulation; uremia or anuria; chronic respiratory acidosis (neonates); salicylate intoxication (neonates)

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: May cause hypoglycemia with extremely large doses.
- Respiratory depression: May cause respiratory depression; monitor closely especially if patient not intubated.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; reduce dose and monitor pH carefully.

Other warnings/precautions:

- Duration of therapy: Drug should not be given for a period of longer than 24 hours unless for a life-threatening situation.
- Extravasation: Avoid extravasation; may cause tissue necrosis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit outweighs possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypervolemia, venospasm

Endocrine & metabolic: Hyperkalemia, hypoglycemia (usually doses >500 mg/kg administered over <1 hour)

Hepatic: Hepatic necrosis (resulted during delivery via umbilical venous catheter)

Local: Necrosis with extravasation, phlebitis, tissue irritation

Respiratory: Apnea, pulmonary edema, respiratory depression

Drug Interactions

Amphetamines: Alkalinizing Agents may decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Monitoring ParametersSerum electrolytes (especially potassium, blood glucose); renal function, arterial blood gases, ECG monitoring, fluid status, ventilation rate

Check infusion site frequently during administration.

Reference RangeBlood pH (physiologic): 7.38-7.42

Monitoring: Lab TestsSerum electrolytes (especially potassium, blood glucose); renal function; arterial blood gases

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

THAM®: 18 g [0.3 molar] (500 mL)

Generic AvailableNo

Mechanism of Action Acts as a proton acceptor, which combines with hydrogen ions, liberating bicarbonate buffer, to correct acidosis. It buffers both metabolic and respiratory acids, limiting carbon dioxide generation. Also an osmotic diuretic.

Pharmacodynamics/Kinetics

Distribution: Distributes quickly into extracellular space; at steady state distributes into a volume slightly greater than total body water; penetrates slowly intracellularly

Half-life elimination: 5.6 hours

Excretion: Urine (>75%) within 8 hours

Pharmacotherapy Pearls1 mM = 120 mg = 3.3 mL = 1 mEq of THAM®

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTris Buffer; Tris(hydroxymethyl)aminomethane

English

Jump To Field (Select Field Name)

Pronunciation(troe PIK a mide)
U.S. Brand NamesMydral™; Mydriacyl®; Tropicacyl®
Canadian Brand NamesDiotrope®; Mydriacyl®
Pharmacologic CategoryOphthalmic Agent, Mydriatic
Use: Labeled IndicationsShort-acting mydriatic used in diagnostic procedures; as well as preoperatively and postoperatively; treatment of some cases of acute iritis, iridocyclitis, and keratitis
Dosing: Adults**Note:** Individuals with heavily pigmented eyes may require larger doses:

Cycloplegia: Ophthalmic: Instill 1-2 drops (1%); may repeat in 5 minutes

Exam must be performed within 30 minutes after the repeat dose; if the patient is not examined within 20-30 minutes, instill an additional drop

Mydriasis: Ophthalmic: Instill 1-2 drops (0.5%) 15-20 minutes before exam; may repeat every 30 minutes as needed

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
StorageStore in tightly closed containers.
ContraindicationsHypersensitivity to tropicamide or any component of the formulation; glaucoma
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Increased intraocular pressure: May cause an increase in intraocular pressure.

Special populations:

• Contact lens wearers: Remove contact lenses before using.

• Pediatrics: Use with caution in infants and children; may cause potentially dangerous CNS disturbances.

Other warnings/precautions:

• Appropriate use: For ophthalmic use only.

Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, tachycardia, vascular congestion

Central nervous system: Headache, parasympathetic stimulations, somnolence

Dermatologic: Eczematoid dermatitis

Gastrointestinal: Dryness of mouth

Local: Transient stinging

Ocular: Blurred vision, follicular conjunctivitis, increased intraocular pressure, photophobia with or without corneal staining

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersOphthalmic exam
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic [drops]: 0.5% (15 mL); 1% (2 mL, 3 mL, 15 mL)

Mydriacyl®: 1% (3 mL, 15 mL) [contains benzalkonium chloride]

Mydral™, Tropicacyl®: 0.5% (15 mL); 1% (15 mL) [contains benzalkonium chloride]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Solution (Mydriacyl)

1% (3): $14.99

1% (15): $52.99

Solution (Tropicamide)

0.5% (15): $12.99

1% (2): $7.99

1% (3): $13.99

1% (15): $13.99

Mechanism of ActionPrevents the sphincter muscle of the iris and the muscle of the ciliary body from responding to cholinergic stimulation

Pharmacodynamics/Kinetics

Onset of action: Mydriasis: ~20-40 minutes; Cycloplegia: ~30 minutes

Duration: Mydriasis: ~6-7 hours; Cycloplegia: <6 hours

Related Information

Trospium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(TROSE pee um)

U.S. Brand NamesSanctura®; Sanctura® XR

Canadian Brand NamesTrosec

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled IndicationsTreatment of overactive bladder with symptoms of urgency, incontinence, and urinary frequency

Dosing: AdultsOveractive bladder: Oral: Immediate release formulation: 20 mg twice daily; extended release formulation: 60 mg once daily

Dosing: Elderly≥75 years: Immediate release formulation: Consider initial dose of 20 mg once daily (based on tolerability) at bedtime

Dosing: Renal ImpairmentCl_{cr} ≤30 mL/minute: Immediate release formulation: 20 mg once daily at bedtime; Extended release formulation: Use not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister tablets at bedtime on an empty stomach. Administer extended release capsules in the morning with a full glass of water 1 hour before eating.

Dietary ConsiderationsGive 1 hour prior to meals or on an empty stomach.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to trospium or any component of the formulation; urinary retention; gastric retention; uncontrolled narrow-angle glaucoma

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Alzheimer's disease: Use with caution in patients with Alzheimer's disease.
- Bladder flow obstruction: Use with caution in patients with bladder flow obstruction; may increase the risk of urinary retention.
- Gastrointestinal obstructive disorders: Use with caution in patients with gastrointestinal obstructive disorders (ie, pyloric stenosis); may increase the risk of gastric retention.
- Glaucoma: Use with caution in patients with controlled (treated) narrow-angle glaucoma.
- Hepatic impairment: Use with caution in patients with moderate-to-severe hepatic impairment.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis due to decreased GI motility.
- Renal impairment: Avoid use of extended release formulation in severe renal impairment (Cl_{cr} <30 mL/minute). Use immediate release formulation with caution in patients with renal impairment; dosage adjustment is required.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis due to decreased GI motility.

Concurrent drug therapy issues:

- Medications eliminated by active tubular secretion (ATS): ATS is a route of elimination; use caution with other medications that are eliminated by ATS (eg, procainamide, pancuronium, vancomycin, morphine).

Special populations:

- Elderly: Use with caution in the elderly ≥65 years of age; increased anticholinergic side effects are seen.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsIn studies, the incidence of anticholinergic side effects was higher in patients ≥65 years of age as compared to younger adults. The extended release formulation should be avoided in patients with Cl_{cr} <30 mL/minute. Not enough information to recommend its use in the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in animal studies. There are no adequate or well-controlled studies in pregnant women; use only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Gastrointestinal: Xerostomia (9% to 22%)

1% to 10%:

Cardiovascular: Tachycardia

Central nervous system: Headache (4% to 7%), fatigue (2%)

Dermatologic: Dry skin

Gastrointestinal: Constipation (9% to 10%), abdominal pain (1% to 3%), dyspepsia (1% to 2%), flatulence (1% to 2%), nausea (1%), abdominal distention (<2%), taste abnormal, vomiting

Genitourinary: Urinary retention (≤1%), urinary tract infection (1% to 7%)

Ocular: Dry eyes (1% to 2%), blurred vision (1%)

Respiratory: Nasopharyngitis (3%), nasal dryness (1%)

Miscellaneous: Influenza (2%)

<1%: Angioneurotic edema, back pain, feces hard, somnolence

Postmarketing and/or case reports: Anaphylaxis, chest pain, delirium, gastritis, hallucinations, hypertensive crisis, palpitation, rash, rhabdomyolysis, Stevens-Johnson syndrome, supraventricular tachycardia, syncope, T-wave inversion

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid use since ethanol may enhance the sedative effects of trospium. Ethanol should not be ingested within 2 hours of the administration of the trospium extended release formulation.

Food: Administration with a fatty meal reduces the absorption and bioavailability of trospium.

Nursing: Physical Assessment/MonitoringUse with caution in presence of narrow-angle glaucoma, bladder flow or gastrointestinal obstruction, renal or hepatic impairment, or Alzheimer's. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, acetylcholinesterase inhibitors, other anticholinergics). Evaluate therapeutic effect (eg, voiding patterns) at baseline and periodically during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Void before taking this medication. Take tablets at bedtime on an empty stomach. Take extended release capsules in the morning with a full glass of water 1 hour before eating. Avoid alcohol for 2 hours before or after taking extended release capsules. May cause dry or sore mouth (frequent mouth care, sucking lozenges or chewing gum may help); constipation (increased exercise, fluids, fruit, or fiber may help); headache or blurred vision (use caution when driving or engaged in potentially hazardous tasks until response to drug in known); or decreased sweating (avoid extreme exercise or activity in hot weather). Report rapid heart beat or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to be pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, as chloride:

Sanctura® XR: 60 mg

Tablet, as chloride:

Sanctura®: 20 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Sanctura XR)

60 mg (30): $105.98

Tablets (Sanctura)

20 mg (30): $66.98

Mechanism of ActionTrospium antagonizes the effects of acetylcholine on muscarinic receptors in cholinergically innervated organs. It reduces the smooth muscle tone of the bladder.

Pharmacodynamics/Kinetics

Absorption: <10%; decreased with food

Distribution: V_d: 395 - >600 L, primarily in plasma

Protein binding: 48% to 85% *in vitro*

Metabolism: Hypothesized to be via esterase hydrolysis and conjugation; forms metabolites

Bioavailability: Immediate release formulation: ~10% (range: 4% to 16%)

Half-life elimination: Immediate release formulation: 20 hours

Severe renal insufficiency (Cl_{cr} <30 mL/minute): ~33 hours; extended release formulation: ~35 hours

Time to peak, plasma: 5-6 hours

Excretion: Feces (85%); urine (~6%; mostly as unchanged drug) primarily via active tubular secretion

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause delirium and hallucinations

Mental Health: Effects on Psychiatric TreatmentDry mouth and other anticholinergic effects are common; concurrent use with psychotropics may produce additive effects; use caution in patients with Alzheimer's disease

Index TermsTrospium Chloride

Trypan Blue

English

Jump To Field (Select Field Name)

Pronunciation(TRYE pan bloo)

U.S. Brand NamesVisionBlue®

Pharmacologic CategoryOphthalmic Agent

Use: Labeled IndicationsStaining of anterior capsule of the lens during cataract surgery

Dosing: Adults**Cataract surgery:** Topical: Apply onto anterior lens capsule using a blunt cannula. Irrigate with balanced salt solution to remove excess dye.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cataract surgery:** Topical: Refer to adult dosing.

Administration: OtherOphthalmic: To minimize dilution, an air bubble should be injected into the anterior chamber of the eye prior to application of trypan blue. Irrigate with balanced salt solution to remove excess dye.

StorageStore at 15°C to 25°C (59°F to 77°F). Protect from direct sunlight.

ContraindicationsHypersensitivity to trypan blue or any component of the formulation; nonhydrated, hydrophilic acrylic intraocular lens (IOL) insertion

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: Irrigate to remove excess solution following injection.
- Staining of dye: Dye may be absorbed by and stain a nonhydrated hydrophilic acrylic IOL.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects, increased fetal mortality, and decreased fetal weight were observed following systemic use in animal studies.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsOcular: Posterior lens staining, vitreous face staining; staining may last up to 1 week

Nursing: Physical Assessment/MonitoringThis medication is used during cataract surgery.

Patient EducationThis medication is used during cataract surgery. Teaching will be appropriate to situation. Posterior lens may become stained during procedure. May last for up to 1 week. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: 0.06% (0.5 mL)

Generic AvailableNo

ManufacturerDORC International

Mechanism of ActionAn acid di-azo group dye which selectively stains connective tissue structures in the human eye

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Trypsin, Balsam Peru, and Castor Oil

Medication Safety Issues

Sound-alike/look-alike issues:

Granulex® may be confused with Regranex®

Pronunciation(TRIP sin, BAL sam pe RUE, & KAS tor oyl)

U.S. Brand NamesAllanderm-T™; Granulex®; Optase™; Xenaderm™

Pharmacologic CategoryProtectant, Topical

Use: Labeled IndicationsTreatment of decubitus ulcers, varicose ulcers, debridement of eschar, dehiscent wounds and sunburn; promote wound healing; reduce odor from necrotic wounds

Dosing: Adults**Dermatologic conditions:** Topical: Apply a minimum of twice daily or as often as necessary

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalClean wound prior to application and at each redressing; shake can well before spraying; hold can upright ~12" from area to be treated. May be used with appropriate dressing if needed.

StorageStore at controlled room temperature; do not freeze. Do not expose spray to fire, open flame, or temperatures >120°F.

ContraindicationsHypersensitivity to trypsin, balsam peru, castor oil, or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Hemoglobin deficiency: Wound healing may be retarded in the presence of hemoglobin deficiency.
- Zinc deficiency: Wound healing may be retarded in the presence of zinc deficiency.

Other warnings/precautions:

- Appropriate use: For external use only; do not apply to fresh arterial clots.

Geriatric ConsiderationsPreventive skin care should be instituted in all elderly patients at high risk for decubitus ulcers. Practical experience with Granulex® has found that it is not as effective in debriding wounds as compared to other enzymatic products. Therefore, Granulex® may be more appropriately used on stage 1 and 2 decubiti.

Adverse ReactionsFrequency not defined: Local: Temporary stinging at application site

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, topical: Trypsin 0.12 mg, balsam Peru 87 mg, and castor oil 788 mg per gram (120 g)

Granulex®: Trypsin 0.12 mg, balsam Peru 87 mg, and castor oil 788 mg per gram (60 g, 120 g)

Gel, topical:

Optase™: Trypsin 0.12 mg, balsam Peru 87 mg, and castor oil 788 mg per gram (95 g)

Ointment, topical:

Allanderm-T™, Xenaderm™: Trypsin 90 USP units, balsam Peru 87 mg, and castor oil 788 mg per gram (30 g, 60 g)

Generic AvailableYes: Aerosol

Pricing: U.S. (www.drugstore.com)

Ointment (Xenaderm)

(30): $59.99

(60): $68.80

Mechanism of ActionTrypsin is used to debride necrotic tissue; balsam peru stimulates circulation at the wound site and may be mildly bactericidal; castor oil improves epithelialization, acts as a protectant covering and helps reduce pain

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBalsam Peru, Trypsin, and Castor Oil; Castor Oil, Trypsin, and Balsam Peru

---

Tuberculin Tests

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Aplisol® may be confused with Anusol®, A.P.L.®, Aplitest®, Atropisol®

Administration issues:

Tuberculin products may be confused with tetanus toxoid products and influenza virus vaccine. Medication errors have occurred when tuberculin skin tests (PPD) have been inadvertently administered instead of tetanus toxoid products and influenza virus vaccine. These products are refrigerated and often stored in close proximity to each other.

Pronunciation(too BER kyoo lin tests)

U.S. Brand NamesAplisol®; Tubersol®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsSkin test in diagnosis of tuberculosis

Dosing: Adults

Diagnosis of tuberculosis, cell-mediated immunodeficiencies: Intradermal: 0.1 mL

TST interpretation: Criteria for positive TST read at 48-72 hours (see Note below for healthcare workers):

Induration ≥5 mm: Persons with HIV infection (or risk factors for HIV infection, but unknown status), recent close contact to person with known active TB, persons with chest x-ray consistent with healed TB, persons who are immunosuppressed

Induration ≥10 mm: Persons with clinical conditions which increase risk of TB infection, recent immigrants, I.V. drug users, residents and employees of high-risk settings, children <4 years of age

Induration ≥15 mm: Persons who do not meet any of the above criteria (no risk factors for TB)

Note: A two-step test is recommended when testing will be performed at regular intervals (eg, for healthcare workers). If the first test is negative, a second TST should be administered 1-3 weeks after the first test was read.

TST interpretation (CDC guidelines) in a healthcare setting:

Baseline test: ≥10 mm is positive (either first or second step)

Serial testing without known exposure: Increase of ≥10 mm is positive

Known exposure:

≥5 mm is positive in patients with baseline of 0 mm

≥10 mm is positive in patients with negative baseline or previous screening result of ≥0mm

Read test at 48-72 hours following placement. Test results with 0 mm induration or measured induration less than the defined cutoff point are considered to signify absence of infection with *M. tuberculosis*. Test results should be documented in millimeters even if classified as negative. Erythema and redness of skin are not indicative of a positive test result.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: OtherFor intradermal administration only. Administer to upper third of forearm (palm up) ≥2 inches from elbow, wrist, or other injection site. If neither arm can be used, may administer to back of shoulder. Administer using inch $^{1}/_{4}$ to $^{1}/_{2}$ inch 27-gauge needle or finer tuberculin syringe. Should form wheal (6-10 mm in diameter) as liquid is injected which will remain ~10 minutes. Avoid pressure or bandage at injection site. Document date and time of injection, person placing TST, location of injection site and lot number of solution.

StorageAplisol®, Tubersol®: Store under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Opened vials should be discarded after 30 days.

ContraindicationsHypersensitivity to tuberculin purified protein derivative (PPD) or any component of the formulation; previous severe reaction to tuberculin PPD skin test (TST)

Warnings/Precautions

Disease-related concerns:

- Burns: Do not administer to persons with extensive burns.

- Eczema: Do not administer to persons with eczema.

- Tuberculosis: Do not administer to persons with documented tuberculosis or a clear history of treatment for tuberculosis.

- Viral infections: Skin testing may be deferred with major viral infections.

Special populations:

- Pediatrics: Very young children (<6 weeks of age) may also have an absent or delayed response.

Other warnings/precautions:

- Administration: For intradermal administration only; do not administer I.V., I.M., or SubQ. Epinephrine (1:1000) should be available to treat possible allergic reactions.

- Appropriate use: Patients with a previous severe reaction to TST (vesiculation, ulceration, necrosis) at the injection site should not receive tuberculin PPD again.

- Conditions decreasing response: Tuberculous or other bacterial infections, viral infection, live virus vaccination, malignancy, immunosuppressive agents, and conditions which impair immune response may cause a decreased response to test.

- Vaccinations: Skin testing may be deferred with live-virus vaccination within 1 month.

Geriatric ConsiderationsDue to changes in the immune system with age, skin test response may be delayed or reduced in magnitude; therefore when testing, use a two-step test procedure; repeat test 2-4 weeks after reading first test dose; this elicits a “booster effect”.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Pregnancy is not a contraindication to testing.

Breast-Feeding ConsiderationsBreast-feeding is not a contraindication to testing.

Adverse ReactionsSuspected adverse reactions should be reported to the Food and Drug Administration (FDA) MedWatch Program at 1-800-332-1088

Frequency not defined:

Dermatologic: Rash

Local: Injection site reactions: Bleeding, bruising, discomfort, erythematous reaction, hematoma, necrosis, pain, pruritus, redness, scarring, ulceration, vesiculation

Miscellaneous: Anaphylaxis

Drug Interactions

Vaccines (Live): May diminish the diagnostic effect of Tuberculin Tests. **Exceptions:** Poliovirus Vaccine (Live/Trivalent/Oral). *Risk D: Consider therapy modification*

Test InteractionsFalse-positive reactions may occur with BCG vaccination or previous mycobacteria (nonTB) infection (previous BCG vaccination is not a contraindication to testing). False-negative reactions may occur with impaired cell mediated immunity.

Monitoring ParametersMonitor for immediate hypersensitivity reactions for ~15 minutes following injection.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Aplisol®, Tubersol®: 5 TU/0.1 mL (1 mL, 5 mL) [contains polysorbate 80]

Generic AvailableNo

Mechanism of ActionTuberculosis results in individuals becoming sensitized to certain antigenic components of the *M. tuberculosis* organism. Culture extracts called tuberculins are contained in tuberculin skin test preparations. Upon intracutaneous injection of these culture extracts, a classic delayed (cellular) hypersensitivity reaction occurs. This reaction is characteristic of a delayed course (peak occurs >24 hours after injection, induration of the skin secondary to cell infiltration, and occasional vesiculation and necrosis). Delayed hypersensitivity reactions to tuberculin may indicate infection with a variety of nontuberculosis mycobacteria, or vaccination with the live attenuated mycobacterial strain of *M. bovis* vaccine, BCG, in addition to previous natural infection with *M. tuberculosis*.

Pharmacodynamics/Kinetics

Onset of action: Delayed hypersensitivity reactions: 5-6 hours

Peak effect: 48-72 hours

Duration: Reactions subside over a few days

Related Information

- Prophylaxis for Patients Exposed to Common Communicable Diseases
- Skin Tests

Pharmacotherapy PearlsSituations where risk of tuberculosis infection may be increased are with contacts of recently-diagnosed persons with active disease, contact with immigrants from countries where tuberculosis is still common, or reactivation with impaired immunity (HIV infection, diabetes, renal failure, immunosuppressant use, pulmonary silicosis). Healthcare workers, staff of correctional facilities, and travelers at high risk of exposure should have routine testing. Patients with HIV infection should be tested as soon as possible following diagnosis.

The date of administration, the product manufacturer, and lot number of product must be entered into the patient's permanent medical record. Results should be recorded in millimeters (even if 0), not “negative” or “positive”.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Typhoid Vaccine

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(TYE foid vak SEEN)
U.S. Brand NamesTyphim Vi®; Vivotif®
Canadian Brand NamesTypherix®; Typhim Vi®; Vivotif®
Pharmacologic CategoryVaccine
Use: Labeled IndicationsActive immunization against typhoid fever caused by *Salmonella typhi*

Not for routine vaccination. In the United States and Canada, use should be limited to:

- Travelers to areas with a prolonged risk of exposure to *S. typhi*
- Persons with intimate exposure to a *S. typhi* carrier
- Laboratory technicians with exposure to *S. typhi*
- Travelers with achlorhydria or hypochlorhydria (Canadian recommendation)

Dosing: Adults**Immunization:**

Oral:

Primary immunization: One capsule on alternate days (day 1, 3, 5, and 7) for a total of 4 doses; all doses should be complete at least 1 week prior to potential exposure

Booster immunization: Repeat full course of primary immunization every 5 years

I.M.:

Initial: 0.5 mL given at least 2 weeks prior to expected exposure

Reimmunization:

Typhim Vi®: 0.5 mL; optimal schedule has not been established; a single dose every 2 years is currently recommended for repeated or continued exposure

Typherix®: 0.5 mL every 3 years

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Immunization:**

Children ≥6 years: Oral: Refer to adult dosing.

Children ≥2 years: I.M.: Refer to adult dosing.

Administration: I.M.Typhim Vi® and Typherix® may be given I.M. and are indicated for children ≥2 years of age; administer as a single 0.5 mL (25 mcg) injection in deltoid muscle. **Do not administer Typhim Vi® or Typherix® intravascularly.**

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends "it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

Administration: OralCapsule: Swallow whole soon after placing into mouth; do not chew or open capsule. Capsule should be taken with a cold or lukewarm beverage (≤37˚C/98.6˚F). Take one hour prior to a meal. Avoid alcohol within 2 hours of administration.
Storage

Typherix®: Store between 2°C to 8°C (35°F to 46°F); do not freeze. Discard if vaccine has been frozen. Protect from light.

Typhim Vi®: Store between 2°C to 8°C (35°F to 46°F); do not freeze.

Vivotif®: Store between 2°C to 8°C (35°F to 46°F).

ContraindicationsHypersensitivity to any component of the vaccine. In addition, the oral vaccine is contraindicated with congenital or acquired immunodeficient state, acute febrile illness, acute GI illness
Warnings/Precautions

Disease-related concerns:

- Typhoid fever: Should not be used to treat typhoid fever. Not all recipients of typhoid vaccine will be fully protected against typhoid fever. Travelers should take all necessary precautions to avoid contact or ingestion of potentially contaminated food or water sources.

Special populations:

- Pediatrics: Safety and efficacy of the injection have not been established in children <2 years of age; safety and efficacy of oral form have not been established in children <6 years of age.

Dosage form specific issues:

- Injection: Administer at least 2 weeks prior to expected exposure. Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever). Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Oral: Full immunization schedule should be completed at least 1 week prior to expected exposure. The complete immunization schedule must be followed to achieve optimum immune response. Vaccination may be deferred with persistent diarrhea or vomiting.

Geriatric ConsiderationsVaccinating elderly is often overlooked; if no record of immunization can be recalled, repeat primary series.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. The manufacturer of the Typhim Vi® injection suggests delaying vaccination until the 2nd or 3rd trimester if possible. Untreated typhoid fever may lead to miscarriage or vertical intrauterine transmission causing neonatal typhoid (rare).

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**In the U.S., all serious adverse reactions must be reported to the Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967. In Canada, adverse reactions are reported to the Canadian Adverse Events following Immunization Surveillance System (CAEFISS) via the Adverse Event Following Immunization Report Form available at http://www.phac-aspc.gc.ca/im/aefi-form_e.html.**

Oral:

1% to 10%:

Central nervous system: Headache (5%), fever (3%)

Dermatologic: Rash (1%)

Gastrointestinal: Abdominal pain (6%), diarrhea (3%), nausea (6%), vomiting (2%)

Postmarketing and/or case reports: Anaphylactic reaction, demyelinating disease, myalgia, pain, RA, urticaria, sepsis, weakness

Injection (incidence may vary based on age and/or product used):

>10%:

Central nervous system: Headache (16% to 20%), fever (undefined; 2% to 32%), malaise (4% to 24%)

Local: Injection site: Tenderness (97% to 98%), pain (27% to 41%), soreness (up to 16%), induration (5% to 15%)

Neuromuscular & skeletal: General aches (1% to 13%)

1% to 10%:

Central nervous system: Fever ≥100°F (2%), >102°F (2%)

Dermatologic: Pruritus (up to 8%)

Gastrointestinal: Nausea (up to 8%), vomiting (2%)

Local: Injection site: Erythema (up to 5%), swelling (up to 4%)

Neuromuscular & skeletal: Myalgia (3% to 7%)

Postmarketing and/or case reports: Abdominal pain, allergic reactions, anaphylaxis, arthralgia, cervical pain, diarrhea, dizziness, flu-like syndrome, Guillain-Barré syndrome, hypotension, injection site inflammation (including angioedema and urticaria), loss of consciousness, lymphadenopathy, malaise, perforated jejunum, rash, serum sickness, tremor, urticaria, vasodilation, weakness

Drug Interactions

Antibiotics: May diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. **Exceptions:** Acetic Acid; Aluminum Acetate; Bacitracin; Benzalkonium Chloride; Benzoin; Capreomycin; Gentian Violet; Hexachlorophene; Mafenide; Neomycin; Oxychlorosene; Polymyxin B; Povidone-Iodine; Silver Nitrate; Silver Sulfadiazine. *Risk D: Consider therapy modification*

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Mefloquine: May enhance the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid alcohol within 2 hours of taking the capsule; may disrupt the enteric coating
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule, enteric coated:

Vivotif®: Viable *S. typhi* Ty21a 2-6.8 x 10^9 colony-forming units and nonviable *S. typhi* Ty21a 5-50 x 10^9 bacterial cells [contains lactose 100-180 mg/capsule and sucrose 26-130 mg/capsule]

Injection, solution:

Typherix® [CAN]: Vi capsular polysaccharide 25 mcg/0.5 mL (0.5 mL) [derived from *S. typhi* Ty2 strain] [not available in U.S.]

Typhim Vi®: Purified Vi capsular polysaccharide 25 mcg/0.5 mL (0.5 mL, 10 mL) [derived from *S. typhi* Ty2 strain]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Capsule, delayed release (Vivotif Berna Vaccine)

(4): $49.99

Mechanism of ActionVirulent strains of *Salmonella typhi* cause disease by penetrating the intestinal mucosa and entering the systemic circulation via the lymphatic vasculature. One possible mechanism of conferring immunity may be the provocation of a local immune response in the intestinal tract induced by oral ingesting of a live strain with subsequent aborted infection. The ability of *Salmonella typhi* to produce clinical disease (and to elicit an immune response) is dependent on the bacteria having a complete lipopolysaccharide. The live attenuate Ty21a strain lacks the enzyme UDP-4-galactose epimerase so that lipopolysaccharide is only synthesized under conditions that induce bacterial autolysis. Thus, the strain remains avirulent despite the production of sufficient lipopolysaccharide to evoke a protective immune response. Despite low levels of lipopolysaccharide synthesis, cells lyse before gaining a virulent phenotype due to the intracellular accumulation of metabolic intermediates.
Pharmacodynamics/Kinetics

Onset of action: Immunity to *Salmonella typhi*: Oral: ~1 week

Duration: Immunity: Oral: ~4-7 years; Parenteral: Typhim Vi®: >17-21 months, Typherix®: ~3 years

Drug InteractionsNone reported

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC} = Discontinued product

Capsule:

Orzel® [DSC]: Tegafur 100 mg and uracil 224 mg

Generic AvailableNo

Mechanism of ActionTegafur is a prodrug of fluorouracil. It is converted *in vivo* to fluorouracil through hepatic microsomal cytochrome P450, and also via thymidine phosphorylase and spontaneous anabolic conversion. Uracil is a competitive inhibitor of dihydropyrimidine dehydrogenase (DPD), the enzyme responsible for catabolism of approximately 85% of fluorouracil to fluoro-β alanine.

Pharmacodynamics/Kinetics

Plasma levels: Tegafur > uracil > fluorouracil

Time to C_{pmax}: Tegafur: 0.6-2.1 hours; uracil: 0.6-4.1 hours; fluorouracil: 0.7-2.0 hours; the relationship between UFT dose and fluorouracil C_{pmax} is not linear

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, and valproic acid may produce additive effects. Hematological side effects are common; use caution with clozapine, carbamazepine, and valproic acid.

Index TermsUracil and Ftorafur; Uracil and Tegafur; Uracil and Tetrahydrofuranyl-5-Fluorouracil

International Brand NamesDerman (MX); Micotex (MX)

Unoprostone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(yoo noe PROS tone)

Canadian Brand NamesRescula®

Pharmacologic CategoryOphthalmic Agent, Antiglaucoma; Prostaglandin, Ophthalmic

Use: Labeled IndicationsTo lower intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension; should be used in patients who are not tolerant of, or failed treatment with other IOP-lowering medications

Dosing: Adults**Glaucoma or ocular hypertension:** Ophthalmic: Instill 1 drop into affected eye(s) twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse with caution, no dosing adjustment reported.

Dosing: Hepatic ImpairmentUse with caution, no dosing adjustment reported.

StorageStore between 2°C to 25°C (36°F to 77°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to unoprostone, benzalkonium chloride, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Ocular effects: May cause permanent change in eye color (increases the amount of brown pigment in the iris); long-term consequences and potential injury to eye are not known. Bacterial keratitis, caused by inadvertent contamination of multiple-dose ophthalmic solutions, has been reported.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established.

- Ocular disease: Use with caution in patients with intraocular inflammation. Safety and efficacy have not been determined for use in patients angle closure, inflammatory or neovascular glaucoma.

- Renal impairment: Use with caution in patients with renal impairment; safety and efficacy have not been established.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo differences in safety and efficacy have been reported in the elderly. Assess patient's ability to self-administer eye drops.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Ocular: Burning/stinging (10% to 25%), dry eyes (10% to 25%), injection (10% to 25%), ophthalmic itching (10% to 25%), increased length of eyelashes (10% to 14%)

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Dizziness, headache, insomnia, pain

Endocrine & metabolic: Diabetes mellitus

Neuromuscular & skeletal: Back pain

Ocular: Abnormal vision (5% to 10%), eyelid disorder (5% to 10%), foreign body sensation (5% to 10%), lacrimation disorder (5% to 10%), decreased length of eyelashes (7%), blepharitis, cataract, conjunctivitis, corneal lesion, eye discharge, eye hemorrhage, eye pain, irritation, keratitis, photophobia, vitreous disorder

Respiratory: Bronchitis, increased cough, pharyngitis, rhinitis, sinusitis

Miscellaneous: Flu-like syndrome (6%), accidental injury, allergic reaction

<1%: Color blindness, corneal deposits, corneal edema, corneal opacity, diplopia, acute elevated intraocular pressure, hyperpigmentation of the eyelid, increase in number of eyelashes, iris hyperpigmentation, iritis, optic atrophy, ptosis, retinal hemorrhage, visual field defect

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic: 0.15% (5 mL) [contains benzalkonium chloride] [DSC]

Generic AvailableNo

Mechanism of ActionThe exact mechanism of action is unknown; however, unoprostone decreases IOP by increasing the outflow of aqueous humor. Cardiovascular and pulmonary function were not affected in clinical studies. IOP was decreased by 3-4 mm Hg in patients with a mean baseline IOP of 23 mm Hg.

Pharmacodynamics/Kinetics

Absorption: Through cornea and conjunctival epithelium

Metabolism: Hydrolyzed by esterases unoprostone-free acid

Half-life elimination: 14 minutes

Excretion: Urine (as metabolites)

Related Information

- Glaucoma Drug Therapy

Pharmacotherapy PearlsContains benzalkonium chloride 0.015% as a preservative

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

U.S. Brand NamesCarmol-HC速
Canadian Brand NamesTi-U-Lac速 H; Uremol速 HC
Pharmacologic CategoryCorticosteroid, Topical
Use: Labeled IndicationsInflammation of corticosteroid-responsive dermatoses
Dosing: Adults**Steroid-responsive dermatoses:** Topical: Apply thin film and rub in well 1-4 times/day. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Allergy Considerations

- Corticosteroid Allergy

Pregnancy Risk FactorC
Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

U.S. Brand NamesAquacare® [OTC]; Aquaphilic® With Carbamide [OTC]; Carmol® 10 [OTC]; Carmol® 20 [OTC]; Carmol® 40; Carmol® Deep Cleaning; Cerovel™; DPM™ [OTC]; Gormel® [OTC]; Hydro 40™; Kerafoam™; Keralac™; Keralac™ Nailstik; Kerol™; Kerol™ Redi-Cloths; Kerol™ ZX; Lanaphilic® [OTC]; Nutraplus® [OTC]; Rea-Lo® [OTC]; Ultra Mide® [OTC]; Umecta® ; Ureacin® [OTC]; Vanamide™

Canadian Brand NamesUltraMide 25™; Uremol®; Urisec®

Pharmacologic CategoryDiuretic, Osmotic; Keratolytic Agent; Topical Skin Product

Use: Labeled IndicationsKeratolytic agent to soften nails or skin; OTC: Moisturizer for dry, rough skin

Dosing: Adults**Hyperkeratotic conditions, dry skin:** Topical: Apply 1-3 times/day.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to urea or any component of the formulation; viral skin disease

Warnings/Precautions

Other warnings/precautions:

- Appropriate application: Urea should not be used near the eyes. Use with caution if applied to face or broken or inflamed skin.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined: Local: Transient stinging, local irritation

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess knowledge/teach appropriate administration, possible side effects, and symptoms to report.

Patient EducationFor external use only. Best effect is obtained when applied to skin while still wet or moist after washing or bathing. Do not apply to broken, inflamed, or infected skin. Do not use near eyes. Report skin redness, irritation, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(yoor oh fol li TROE pin)

U.S. Brand NamesBravelle®

Canadian Brand NamesBravelle®; Fertinorm® H.P.

Pharmacologic CategoryGonadotropin; Ovulation Stimulator

Use: Labeled IndicationsOvulation induction in patients who previously received pituitary suppression; development of multiple follicles with Assisted Reproductive Technologies (ART)

Dosing: Adults**Note:** Dose should be individualized. Use the lowest dose consistent with the expectation of good results. Over the course of treatment, doses may vary depending on individual patient response.

Females:

Ovulation induction: I.M., SubQ: Initial: 150 int. units daily for the first 5 days of treatment. Dose adjustments ≤75-150 int. units can be made every ≥2 days; maximum daily dose: 450 int. units; treatment >12 days is not recommended. If response to follitropin is appropriate, hCG is given 1 day following the last dose. Withhold hCG if serum estradiol is >2000 pg/mL, if the ovaries are abnormally enlarged, or if abdominal pain occurs.

ART: SubQ: 225 int. units daily for the first 5 days; dose may be adjusted based on patient response, but adjustments should not be made more frequently than once every 2 days; maximum adjustment: 75-150 int. units; maximum daily dose: 450 int. units; maximum duration of treatment: 12 days. When a sufficient number of follicles of adequate size are present, the final maturation of the follicles is induced by administering hCG. Withhold hCG in cases where the ovaries are abnormally enlarged on the last day of therapy.

Administration: I.M.Administer I.M. or SubQ; gently massage site after administration. For I.M. injection, administer in upper quadrant of buttock near hip.

Administration: OtherAdminister SubQ or I.M.; gently massage site after administration. For SubQ injection, administer on lower abdomen; thigh is not recommended unless abdomen cannot be used.

StorageLyophilized powder may be stored in the refrigerator or at room temperature of 3°C to 25°C (37°F to 77°F). Protect from light.

Reconstitution Dissolve contents of vial in sterile saline 1 mL; gently swirl (do not shake). Do not use if solution is not clear or contains particles. If more than 1 vial is required for a single dose, up to 6 vials can be reconstituted with sterile saline 1 mL and administered as a single injection. This is done by first reconstituting 1 vial with sterile saline as previously described, withdrawing the entire contents of the reconstituted vial, and (using this as the diluent for the second vial) injecting into the second vial, etc. Use immediately after reconstitution.

ContraindicationsHypersensitivity to follitropins or any component of the formulation; high levels of FSH indicating primary ovarian failure; uncontrolled thyroid or adrenal dysfunction; the presence of any cause of infertility other than anovulation; presence of an organic intracranial lesion (eg, pituitary tumor); abnormal vaginal bleeding of undetermined origin; ovarian cysts or enlargement not due to polycystic ovary syndrome; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain, occurs in ~20% of those treated with urofollitropin and hCG, and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of ovarian hyperstimulation syndrome (OHSS).

- Ovarian hyperstimulation syndrome (OHSS): OHSS is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly within 24 hours to several days and generally occurs during the 7-10 days immediately following treatment. Hemoconcentration associated with fluid loss into the abdominal cavity has occurred and should be assessed by fluid intake and output, weight, hematocrit, serum and urinary electrolytes, urine specific gravity, BUN and creatinine, and abdominal girth. Determinations should be performed daily or more often if the need arises. Treatment is primarily symptomatic and consists of bedrest, fluid and electrolyte replacement, and analgesics. The ascitic, pleural, and pericardial fluids should not be removed unless needed to relieve symptoms of cardiopulmonary distress.

- Pulmonary effects: Serious pulmonary conditions (atelectasis, acute respiratory distress syndrome, and exacerbation of asthma) have been reported.

- Thromboembolic events: In association with and separate from ovarian hyperstimulation syndrome (OHSS), thromboembolic events have been reported.

Special populations:

- Elderly: Safety and efficacy have not been established in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Lactose: Products may contain lactose.

Other warnings/precautions:

- Appropriate use: To minimize risks, use only at the lowest effective dose. Monitor ovarian response with serum estradiol and vaginal ultrasound on a regular basis.
- Experienced physician: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management.
- Multiple births: May result from the use of these medications; advise patient of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsEctopic pregnancy, congenital abnormalities, spontaneous abortion, and multiple births have been reported. The incidence of congenital abnormality may be slightly higher after ART than with spontaneous conception; higher incidence may be related to parenteral characteristics (maternal age, sperm characteristics).

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsPercentage may vary by indication, route of administration.

>10%:

Central nervous system: Headache

Endocrine & metabolic: Ovarian enlargement, ovarian hyperstimulation syndrome

Gastrointestinal: Abdominal cramps

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Depression, emotional lability, fever, pain

Dermatologic: Acne, exfoliative dermatitis, rash

Endocrine & metabolic: Breast tenderness, hot flashes, ovarian disorder (pain, cyst)

Gastrointestinal: Abdomen enlarged, abdominal pain, constipation, diarrhea, dehydration, nausea, vomiting, weight gain

Genitourinary: Cervical disorder, urinary tract infection, pelvic pain/cramps, uterine spasms, vaginal discharge, vaginal hemorrhage, vaginal spotting

Local: Injection site reaction

Neuromuscular & skeletal: Neck pain

Respiratory: Respiratory disorder, sinusitis

Miscellaneous: Infection, postretrieval pain

Postmarketing, case reports, or events reported with gonadotropins: Acute respiratory distress syndrome, adnexal torsion, anaphylactic reactions, arterial occlusion, atelectasis, cerebral vascular occlusion, deep vein thrombosis, hemoperitoneum, hypersensitivity reactions, ovarian neoplasms, pulmonary embolism

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor sufficient follicular maturation. This may be directly estimated by sonographic visualization of the ovaries and endometrial lining or measuring serum estradiol levels. The combination of both ultrasonography and measurement of estradiol levels is useful for monitoring for the growth and development of follicles and timing hCG administration.

The clinical evaluation of estrogenic activity (changes in vaginal cytology and changes in appearance and volume of cervical mucus) provides an indirect estimate of the estrogenic effect upon the target organs and, therefore, it should only be used adjunctively with more direct estimates of follicular development (ultrasonography and serum estradiol determinations).

The clinical confirmation of ovulation is obtained by direct and indirect indices of progesterone production. The indices most generally used are: rise in basal body temperature, increase in serum progesterone, and menstruation following the shift in basal body temperature.

Monitor for signs and symptoms of OHSS for at least 2 weeks following hCG administration.

Nursing: Physical Assessment/MonitoringThis medication should only be prescribed by a fertility specialist. Assess results of laboratory tests and therapeutic effectiveness on a regular basis. Assess knowledge/teach patient appropriate use (injection technique and syringe disposal), interventions to reduce side effects, and adverse symptoms to report. **Pregnancy risk factor X:** Pregnancy must be excluded before starting medication.

Monitoring: Lab TestsMonitor sufficient follicular maturation. This may be directly estimated by sonographic visualization of the ovaries and endometrial lining or measuring serum estradiol levels. The combination of both ultrasonography and measurement of estradiol levels is useful for monitoring for the growth and development of follicles and timing hCG administration.

Patient EducationThis medication can only be administered by injection. If you are using this medication at home, follow exact instruction for administering injections and disposal of syringes. Administer exact amount as instructed; do not alter dosage or miss a dose. If dose is missed, notify prescriber. Frequent laboratory tests will be required while you are on this therapy; do not miss appointments for laboratory tests or ultrasound. You may experience headache, dizziness, or fever (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or vomiting (small frequent meals, frequent oral care, sucking lozenges, or chewing gum may help). Report immediately abdominal pain/distension, bloating, persistent nausea, vomiting, diarrhea; dyspnea, respiratory difficulty, exacerbation of asthma; swelling, pain, or redness of extremities; itching or burning on urination; menstrual irregularity, acute backache; rash, pain, or inflammation at injection site; or other adverse response. **Pregnancy/breast-feeding precautions:** Pregnancy must be ruled out prior to initiating this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [human origin]:

Bravelle®: 75 int. units [contains lactose; packaged with diluent]

Mechanism of ActionUrofollitropin is a preparation of highly purified follicle-stimulating hormone (FSH) extracted from the urine of postmenopausal women. Follitropins stimulate ovarian follicular growth in women who do not have primary ovarian failure. FSH is required for normal follicular growth, maturation, gonadal steroid production, and spermatogenesis.

Pharmacodynamics/Kinetics

Half-life elimination

I.M.: 37 hours, 15 hours following multiple doses

SubQ: 32 hours, 21 hours following multiple doses

Time to peak, plasma:

I.M.: 17 hours, 11 hours following multiple doses

SubQ: 21 hours, 10 hours following multiple doses

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ur oh KYE nase)

U.S. Brand NamesKinlytic™

Pharmacologic CategoryThrombolytic Agent

Use: Labeled IndicationsThrombolytic agent for the lysis of acute massive pulmonary emboli or pulmonary emboli with unstable hemodynamics

Use: Unlabeled/InvestigationalThrombolytic agent used in treatment of recent severe or massive deep vein thrombosis, and occluded I.V. or dialysis cannulas; peripheral arterial occlusive disease

Dosing: Adults

Acute pulmonary embolism: I.V.: Loading: 4400 int. units/kg over 10 minutes; maintenance: 4400 int. units/kg/hour for 12 hours. To prevent recurrent thrombosis, anticoagulation treatment is recommended after the completion of urokinase infusion; if heparin is used, do not administer heparin loading dose. Do not start anticoagulation until aPTT has decreased to less than twice the normal control value.

Acute peripheral arterial occlusion of leg (unlabeled use; Ouriel, 1998): I.V.: 4000 int. units/minute for 4 hours, followed by 2000 int. units/minute for up to a total duration of therapy of 48 hours. **Note:** Systemic heparinization should not be given concurrently.

Deep vein thrombosis (unlabeled use): I.V.: Loading: 4400 units/kg over 10 minutes, then 4400 units/kg/hour for 12 hours

Occluded I.V. catheters (unlabeled use):

5000 units in each lumen over 1-2 minutes, leave in lumen for 1-4 hours, then aspirate. May repeat with 10,000 units in each lumen if 5000 units fails to clear the catheter. **Do not infuse into the patient**. Volume to instill into catheter is equal to the volume of the catheter. Will not dissolve drug precipitate or anything other than blood products.

I.V. infusion: 200 units/kg/hour in each lumen for 12-48 hours at a rate of at least 20 mL/hour

Dialysis patient: 5000 units is administered in each lumen over 1-2 minutes; leave urokinase in lumen for 1-2 days, then aspirate.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren: Deep vein thrombosis: I.V.: Refer to adult dosing.

Administration: I.V.Solution may be filtered with ≤0.45 micron filter during I.V. therapy. Administer using an infusion pump. When prepared to a total volume of 195 mL, the loading dose should be administered at 90 mL/hour over 10 minutes. The maintenance dose should be administered at 15 mL/hour over 12 hours. I.V. tubing should be flushed with NS or D_5W to ensure total dose is administered.

Administration: I.V. DetailpH: 6-7.5

StoragePrior to reconstitution, store in refrigerator at 2°C to 8°C (36°F to 46°F).

ReconstitutionReconstitute vial with 5 mL preservative free sterile water for injection by gently rolling and tilting; do not shake. Contains no preservatives; should not be reconstituted until immediately before using. Discard unused portion. Solution will look pale and straw colored. May filter through ≤0.45 micron filter. Prior to infusion, solution should be further diluted in D_5W or NS; the manufacturer recommends a total infusion volume of 195 mL.

CompatibilityStable in NS, D_5W.

Y-site administration: Variable (consult detailed reference): TPN.

ContraindicationsHypersensitivity to urokinase or any component of the formulation; active internal bleeding; recent (within 2 months) CVA, intracranial surgery or intraspinal surgery; recent trauma (including cardiopulmonary resuscitation); intracranial neoplasm, arteriovenous malformation, or aneurysm; known bleeding diathesis; severe uncontrolled arterial hypertension

Allergy Considerations

- Urokinase Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Risk of bleeding is increased with use; fatal hemorrhage has been reported. Monitor all potential bleeding sites. If serious bleeding occurs, urokinase infusion should be stopped.
- Cholesterol embolization: Has been reported rarely with the use of thrombolytics, usually associated with invasive vascular procedures and/or anticoagulant therapy.
- Hypersensitivity: Hypersensitivity reactions, including fatal anaphylaxis (rare), bronchospasm, orolingual edema, and urticaria have been reported. Infusion reactions (eg, chills, rigor, hypoxia, hyper-/hypotension, tachycardia) may also occur. Reactions usually occur

within the first hour of infusion.

Disease-related concerns:

- Conditions that increase bleeding risk: For the following conditions the risk of bleeding is higher with use of thrombolytics and should be weighed against the benefits of therapy: Recent (within 10 days) major surgery, obstetrical delivery, organ biopsy, or previous puncture of noncompressible vessels; pregnancy, cerebrovascular disease, recent (within 10 days) gastrointestinal bleeding, high likelihood of left heart thrombus (in the setting of mitral stenosis with atrial fibrillation), subacute bacterial endocarditis, hemostatic defects including those caused by severe renal or hepatic dysfunction, diabetic hemorrhagic retinopathy, and/or any other condition in which bleeding constitutes a significant hazard or would be particularly difficult to manage because of location. Use is contraindicated in recent trauma, including CPR.

Concurrent drug therapy issues:

- Anticoagulants: Use with caution in patients receiving oral anticoagulants or platelet inhibitors; increased risk of bleeding.

- Heparin: Concurrent heparin anticoagulation may contribute to bleeding.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Formulated in human albumin; products made from human sources have a theoretical risk of transmitting infectious agents.

Other warnings/precautions:

- Administration: Intramuscular injections and nonessential handling of the patient should be avoided. Venipunctures should be performed carefully and only when necessary. If arterial puncture is necessary, use an upper extremity vessel that can be manually compressed.

Pregnancy Risk FactorB

Pregnancy ConsiderationsUrokinase was not found to be teratogenic in animal studies; it is not known if it crosses the human placenta. Placental separation and hemorrhage have been reported in one patient treated at 3 months gestation. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is the major adverse effect associated with urokinase. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the dosage administered, concurrent use of multiple agents which alter hemostasis, and patient predisposition.

>10%: Local: Injection site: Bleeding (5% decrease in hematocrit reported in 37% patients; most bleeding occurring at external incisions or injection sites, but also reported in other areas)

<1%, postmarketing, and/or case reports: Allergic reaction (includes anaphylaxis, bronchospasm, orolingual edema, urticaria, skin rash, pruritus), cardiac arrest, cerebral vascular accident, chest pain, cholesterol embolism, diaphoresis, hemiplegia, intracranial hemorrhage, retroperitoneal hemorrhage, MI, pulmonary edema, recurrent pulmonary embolism, reperfusion ventricular arrhythmia, stroke, substernal pain, thrombocytopenia, vascular embolization (cerebral and distal); infusion reactions (most occurring within 1 hour) including acidosis, back pain, chills, cyanosis, dyspnea, fever, hyper-/hypotension, hypoxia, nausea, rigors, tachycardia, vomiting

Drug Interactions

Anticoagulants: Thrombolytic Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Aprotinin: May diminish the therapeutic effect of Thrombolytic Agents. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Thrombolytic Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Thrombolytic Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure (avoid using lower extremities for BP), pulse; CBC, platelet count, aPTT, urinalysis

Nursing: Physical Assessment/MonitoringWeigh benefits against risks when bleeding/hemorrhage constitute a significant hazard. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (especially those medications that may affect coagulation or platelet function). See Administration for infusion specifics. Assess results of laboratory results. Patient should be closely monitored for bleeding during and following treatment (infusion site, neurological status [eg, intracranial hemorrhage], vital signs, ECG [reperfusion arrhythmias]). Bedrest and bleeding precautions should be maintained; avoid I.M. injections, venipuncture (unless absolutely necessary), and nonessential handling of the patient. If arterial puncture is necessary, use an upper extremity vessel that can be manually compressed. Patient instructions determined by patient condition.

Monitoring: Lab TestsCBC, platelet count, aPTT, urinalysis

Patient EducationInform prescriber of all medications or herbal products you are taking. This medication is only administered by infusion; you will be monitored closely during and after treatment. Immediately report burning, pain, redness, swelling, or oozing at infusion site;

sudden acute headache; joint pain; chest pain; or altered vision. Following infusion, you will have a tendency to bleed easily; use caution to prevent injury (use electric razor, soft toothbrush, and caution with knives, needles, or anything sharp). Follow instructions for strict bedrest to reduce the risk of injury. If bleeding occurs, report immediately and apply pressure to bleeding spot until bleeding stops completely. Report unusual bruising or bleeding; blood in urine, stool, or vomitus; bleeding gums; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Product Availability

Kinlytic™: ImaRx Therapeutics retired the trade name Abbokinase® for urokinase and is currently marketing urokinase under the trade name Kinlytic™

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Kinlytic™: 250,000 int. units [contains albumin (human)]

Generic AvailableNo

ManufacturerIMARX Therapeutics

Mechanism of ActionPromotes thrombolysis by directly activating plasminogen to plasmin, which degrades fibrin, fibrinogen, and other procoagulant plasma proteins

Pharmacodynamics/Kinetics

Onset of action: I.V.: Fibrinolysis occurs rapidly

Duration: ≥4 hours

Distribution: 11.5 L

Half-life elimination: 6.4-18.8 minutes

Excretion: Urine and feces (small amounts)

Dental Health: Effects on Dental TreatmentNo effects or complications reported

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

Acute Pulmonary Embolism (PE): The American College of Chest Physicians (Kearon, 2008) recommends the following:

All patients with PE: All patients with diagnosed PE should undergo rapid risk stratification based on risk of death from PE and bleeding. In general, the majority of patients with PE will not require treatment with thrombolytics; however, treatment with anticoagulation (eg, enoxaparin, heparin) will be necessary unless contraindicated.

Patients with PE without hemodynamic compromise: In general, patients without hemodynamic compromise should not receive thrombolytic therapy. However, patients without hemodynamic compromise but with poor prognostic indicators (elevated troponin, right ventricular dysfunction on echocardiogram, etc) are at high risk of an adverse outcome and may derive benefit from receiving systemic thrombolysis. Therefore, the most recent recommendation is to administer thrombolysis in these selected high-risk patients who have a low risk of bleeding. The use of regimens with short infusion times (eg, 2-hour infusion) is recommended over longer infusion times (eg, 12-hour infusions). The most widely used thrombolytic for this indication is alteplase which is administered as an infusion of 100 mg over 2 hours. Urokinase may also be used; however, the administration time for urokinase is 12 hours.

Patients with PE with hemodynamic compromise: Since thrombolytic therapy has been shown to accelerate thrombolysis resulting in more rapid resolution of perfusion scan abnormalities, decrement angiographic thrombus, reduction in elevated pulmonary artery pressures, and normalization of right ventricular dysfunction in patients with PE and hemodynamic compromise (usually defined as SBP <90 mm Hg requiring vasopressor therapy), the use of thrombolytic therapy via a peripheral vein is recommended unless major contraindications exist. The use of regimens with short infusion times (eg, 2-hour infusion) is recommended over longer infusion times (eg, 12-hour infusions). The most widely used thrombolytic for this indication is alteplase which is administered as an infusion of 100 mg over 2 hours. Urokinase may also be used; however, the administration time for urokinase is 12 hours.

Patients with PE experiencing cardiac arrest: According to the 2005 ACLS guidelines, when PE is responsible for cardiac arrest and the patient is unresponsive to cardiopulmonary resuscitation (CPR), it is reasonable to administer bolus thrombolytic therapy, specifically alteplase (Böttiger, 2001). However, routine use in cardiac arrest or undifferentiated pulseless electrical activity (PEA) is not recommended. Of note, ongoing CPR is not a contraindication in this setting.

Anesthesia and Critical Care Concerns/Other Considerations

Acute Pulmonary Embolism (PE): The American College of Chest Physicians (Kearon, 2008) recommends the following:

All patients with PE: All patients with diagnosed PE should undergo rapid risk stratification based on risk of death from PE and bleeding. In general, the majority of patients with PE will not require treatment with thrombolytics; however, treatment with anticoagulation (eg, enoxaparin, heparin) will be necessary unless contraindicated.

Patients with PE without hemodynamic compromise: In general, patients without hemodynamic compromise should not receive thrombolytic therapy. However, patients without hemodynamic compromise but with poor prognostic indicators (elevated troponin, right ventricular dysfunction on echocardiogram, etc) are at high risk of an adverse outcome and may derive benefit from receiving systemic thrombolysis. Therefore, the most recent recommendation is to administer thrombolysis in these selected high-risk patients who have a low risk of bleeding. The use of regimens with short infusion times (eg, 2-hour infusion) is recommended over longer infusion times (eg, 12-hour infusions). The most widely used thrombolytic for this indication is alteplase which is administered as an infusion of 100 mg over 2 hours. Urokinase may also be used; however, the administration time for urokinase is 12 hours.

Patients with PE with hemodynamic compromise: Since thrombolytic therapy has been shown to accelerate thrombolysis resulting in more rapid resolution of perfusion scan abnormalities, decrement angiographic thrombus, reduction in elevated pulmonary artery pressures, and normalization of right ventricular dysfunction in patients with PE and hemodynamic compromise (usually defined as SBP <90 mm Hg requiring vasopressor therapy), the use of thrombolytic therapy via a peripheral vein is recommended unless major contraindications exist. The use of regimens with short infusion times (eg, 2-hour infusion) is recommended over longer infusion times (eg, 12-hour infusions). The most widely used thrombolytic for this indication is alteplase which is administered as an infusion of 100 mg over 2 hours. Urokinase may also be used; however, the administration time for urokinase is 12 hours.

Patients with PE experiencing cardiac arrest: According to the 2005 ACLS guidelines, when PE is responsible for cardiac arrest and the patient is unresponsive to cardiopulmonary resuscitation (CPR), it is reasonable to administer bolus thrombolytic therapy, specifically alteplase (Böttiger, 2001). However, routine use in cardiac arrest or undifferentiated pulseless electrical activity (PEA) is not recommended. Of note, ongoing CPR is not a contraindication in this setting.

Ursodiol

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(ur soe DYE ol)

U.S. Brand NamesActigall®; Urso 250™; Urso Forte™

Canadian Brand NamesDOM-Ursodiol C; PHL-Ursodiol C; PMS-Ursodiol C; Urso®; Urso® DS

Pharmacologic CategoryGallstone Dissolution Agent

Use: Labeled IndicationsActigall®: Gallbladder stone dissolution; prevention of gallstones in obese patients experiencing rapid weight loss; Urso®: Primary biliary cirrhosis

Use: Unlabeled/InvestigationalLiver transplantation

Dosing: Adults

Gallstone dissolution: Oral: 8-10 mg/kg/day in 2-3 divided doses; use beyond 24 months is not established; obtain ultrasound images at 6-month intervals for the first year of therapy; 30% of patients have stone recurrence after dissolution

Gallstone prevention: Oral: 300 mg twice daily

Primary biliary cirrhosis: Oral: 13-15 mg/kg/day in 2-4 divided doses (with food)

Dosing: ElderlyRefer to adult dosing.

Administration: OralDo not administer with aluminum-based antacids. If aluminum-based antacids are needed, administer 2 hours after ursodiol. Urso® should be taken with food.

Dietary ConsiderationsUrso® should be taken with food.

StorageDo not store above 30°C (86°F).

Extemporaneously PreparedA 60 mg/mL ursodiol suspension may be made by opening twelve 300 mg capsules and wetting with sufficient glycerin and triturating to make a fine paste; gradually add 45 mL of simple syrup in three steps:

1. Add 15 mL to paste, triturate well, and transfer to 2 oz amber bottle
2. Rinse mortar with 10 mL simple syrup and add to amber bottle
3. Repeat step 2 with sufficient syrup to make 60 mL final volume; label “Shake Well and Store in Refrigerator”; 35-day stability

ContraindicationsHypersensitivity to ursodiol, bile acids, or any component of the formulation; not to be used with cholesterol, radiopaque, bile pigment stones, or stones >20 mm in diameter; allergy to bile acids

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with chronic liver disease.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Duration of therapy: Gallbladder stone dissolution may take several months of therapy; complete dissolution may not occur and recurrence of stones within 5 years has been observed in 50% of patients.
- Nonvisualizing gallbladder: Use with caution in patients with a nonvisualizing gallbladder.

Geriatric ConsiderationsNo specific clinical studies in the elderly. Would recommend starting at lowest recommended dose with scheduled monitoring.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (up to 25%), dizziness (up to 17%)

Gastrointestinal: In treatment of primary biliary cirrhosis: Constipation (up to 26%)

1% to 10%:

Dermatologic: Rash (<1% to 3%), alopecia (<1% to 5%)

Gastrointestinal:

In gallstone dissolution: Most GI events (diarrhea, nausea, vomiting) are similar to placebo and attributable to gallstone disease.

In treatment of primary biliary cirrhosis: Diarrhea (1%)

Hematologic: Leukopenia (3%)

Miscellaneous: Allergy (5%)

<1%: Abdominal pain, biliary pain, fatigue, metallic taste, nausea, pruritus, vomiting

In treatment of primary biliary cirrhosis: Constipation, dyspepsia, headache

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersALT, AST, sonogram
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness, and adverse reactions. Teach patient proper use and possible side effects signs to report.
Monitoring: Lab Tests

Gallstone disease: ALT, AST, ALP; sonogram may be required

Hepatic disease: Monitor hepatic function tests frequently

Patient EducationTake medication as directed with food. Drug will need to be taken for 1-3 months after stone is dissolved and stones may recur. Report any persistent nausea, vomiting, abdominal pain, or yellowing of skin or eyes. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Actigall®): 300 mg

Tablet:

Urso 250™: 250 mg

Urso Forte™: 500 mg

Generic AvailableYes: Capsule
Pricing: U.S. (www.drugstore.com)

Capsules (Actigall)

300 mg (30): $127.76

Capsules (Ursodiol)

300 mg (30): $71.99

Tablets (Urso 250)

250 mg (30): $85.85

Tablets (Urso Forte)

500 mg (30): $152.58

Mechanism of ActionDecreases the cholesterol content of bile and bile stones by reducing the secretion of cholesterol from the liver and the fractional reabsorption of cholesterol by the intestines. Mechanism of action in primary biliary cirrhosis is not clearly defined.
Pharmacodynamics/Kinetics

Metabolism: Undergoes extensive enterohepatic recycling; following hepatic conjugation and biliary secretion, the drug is hydrolyzed to active ursodiol, where it is recycled or transformed to lithocholic acid by colonic microbial flora

Half-life elimination: 100 hours

Excretion: Feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Stelara® may be confused with Aldara®

Ustekinumab may be confused with infliximab, rituximab

Pronunciation(yoo stek in YOO mab)

Canadian Brand NamesStelara®

Pharmacologic CategoryAntipsoriatic Agent; Interleukin-12 Inhibitor; Interleukin-23 Inhibitor; Monoclonal Antibody

Use: Labeled IndicationsTreatment of moderate-to-severe chronic plaque psoriasis

Dosing: Adults **Plaque psoriasis:** SubQ:

Initial and maintenance: **Note:** Following an interruption in therapy, retreatment may be initiated at the initial dosing interval. Consider therapy discontinuation in any patient failing to demonstrate a response after 12 weeks of therapy.

≤100 kg: 45 mg at 0- and 4 weeks, and then every 12 weeks thereafter (if inadequate response, may change to every 8 weeks)

>100 kg: 45 mg or 90 mg at 0- and 4 weeks, and then every 12 weeks thereafter (if inadequate response, may change to every 8 weeks)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse has not been studied in renal dysfunction.

Dosing: Hepatic ImpairmentUse has not been studied in hepatic dysfunction.

Administration: OtherDo not use if cloudy or discolored. Administer by subcutaneous injection into the top of the thigh, abdomen, upper arms, or buttocks. Avoid areas of skin where psoriasis is present.

StorageStore vials refrigerated at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake . Protect from light; store in original container.

RestrictionsNot available in the U.S

ContraindicationsHypersensitivity to ustekinumab or any component of the formulation; severe infections such as sepsis, tuberculosis and opportunistic infections

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: Antibody formation to ustekinumab has been observed with therapy and has been associated with decreased serum levels and therapeutic response in some patients.

- Hypersensitivity reactions: Discontinue immediately with signs/symptoms of hypersensitivity reaction and treat appropriately as indicated.

- Infections: Infrequent, but serious bacterial, fungal, and viral infections have been observed with use. Avoid use in patients with clinically important active infection. Exercise caution when considering use in patients with a history of new/recurrent infections, with conditions that predispose them to infections (eg, diabetes or residence/travel from areas of endemic mycoses), or with chronic, latent, or localized infections. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued or withheld until successful resolution of infection.

- Malignancy: May increase the risk for malignancy although the impact on the development and course of malignancies is not fully defined. In clinical trials, the incidence of malignancy associated with ustekinumab therapy was comparable to that of the general population. Use with caution in patients with prior malignancy (use not studied in this population).

- Tuberculosis: Avoid use in patients with active tuberculosis (TB). Patients should be evaluated for latent tuberculosis infection with a tuberculin skin test prior to starting therapy. Treatment of latent TB should be initiated before ustekinumab therapy is used. During and following treatment, monitor for signs/symptoms of active TB.

Disease-related concerns:

- Hepatic impairment: Use caution in patients with hepatic impairment. Use has not been studied in this patient population.

- Renal impairment: Use caution in patients with renal impairment. Use has not been studied in this patient population.

Concurrent drug therapy issues:

- Immunosuppressive therapy: Use in combination with other immunosuppressive drugs has not been studied; use caution.

Special populations:

- Patients >100 kg: May require higher dose to achieve adequate serum levels.

- Pediatrics: Use has not been studied in children <18 years of age.

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. **Live vaccines should not be given concurrently**; inactivated or nonlive vaccines may be given concurrently.

- Phototherapy: Use in combination with phototherapy has not been studied; use caution.

Pregnancy ConsiderationsReproduction studies have not been conducted in pregnant women. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsIt is not known whether ustekinumab is secreted in human milk. Because many immunoglobulins are secreted in milk and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.
Adverse Reactions

1% to 10%:

Central nervous system: Headache (5%), fatigue (3%), dizziness (1% to 2%), depression (≤1%)

Dermatologic: Pruritus (1% to 2%), rash (<2%), urticaria (<2%)

Local: Injection site erythema (1% to 2%)

Neuromuscular & skeletal: Arthralgia (2% to 3%), back pain (1% to 2%), myalgia (1%)

Respiratory: Nasopharyngitis (7% to 8%), upper respiratory infection (4% to 5%), pharyngolaryngeal pain (1% to 2%)

Miscellaneous: Antibody formation (5%)

<1%, postmarketing, and/or case reports: Angina, bacterial infection, cellulitis, dactylitis, diverticulitis, fungal infection, gastroenteritis, herpes zoster, hypertension; injection site reactions (bruising, hemorrhage, induration, irritation, pain, pruritus, swelling); malignancy (breast, colon, head and neck, prostate, thyroid); MI, nephrolithiasis, osteomyelitis, pneumonia, stroke, urinary tract infection, viral infection

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersPlace and read PPD prior to initiating therapy; monitor for signs/symptoms of infection; CBC; Ustekinumab-antibody formation
Monitoring: Lab TestsPlace and read PPD prior to initiating therapy; CBC; Ustekinumab-antibody formation
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian product availability

Injection, solution [preservative free]:

Stelara® [CAN]: 45 mg/0.5 mL (0.5 mL); 90 mg/1 mL (1 mL) [not available in the U.S.]

Generic AvailableNo
ManufacturerJanssen-Ortho, Inc
Mechanism of ActionUstekinumab is a human monoclonal antibody that binds to and interferes with the proinflammatory cytokines, interleukin (IL)-12 and IL-23. Biological effects of IL-12 and IL-23 include natural killer (NK) cell activation, CD4+ T-cell differentiation and activation. Ustekinumab also interferes with the expression of monocyte chemotactic protein-1 (MCP-1), tumor necrosis factor-alpha (TNF-α), interferon-inducible protein-10 (IP-10), and interleukin-8 (IL-8). Significant clinical improvement in psoriasis patients is seen in association with reduction of these proinflammatory signalers.
Pharmacodynamics/Kinetics

Distribution: V_d (terminal elimination phase): 0.076-0.161 L/kg

Bioavailability: Absolute bioavailability: SubQ: ~57%

Half-life elimination: 15-32 days

Vaccinia Immune Globulin (Intravenous)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(vax IN ee a i MYUN GLOB yoo lin IN tra VEE nus)

U.S. Brand NamesCNJ-016™

Pharmacologic CategoryImmune Globulin

Use: Labeled IndicationsTreatment of infectious complications of smallpox (vaccinia virus) vaccination, such as eczema vaccinatum, progressive vaccinia, and severe generalized vaccinia; treatment of vaccinia infections in individuals with concurrent skin conditions or accidental virus exposure to eyes (except vaccinia keratitis), mouth, or other areas where viral infection would pose significant risk

Dosing: Adults **Vaccinial infection:** I.V.:

CNJ-016™ (Cangene product): 6000 units/kg; 9000 units/kg may be considered if patient does not respond to initial dose.

DynPort product: Total dose: 2 mL/kg (100 mg/kg); higher doses (200-500 mg/kg) may be considered if patient does not respond to initial recommended dose (sucrose-related renal impairment is worsened at doses ≥400 mg/kg)

Dosing: ElderlySafety and efficacy have not been established.

Dosing: Renal ImpairmentUse caution. Doses ≥400 mg/kg of the DynPort product are not recommended.

Administration: I.V.Do not shake; avoid foaming. For intravenous use only. Predilution is not recommended. If dedicated line not available, flush with NS prior to administration of VIGIV. Do not exceed recommended rates of infusion.

CNJ-016™ (Cangene product): Patients ≥50 kg: Infuse at ≤2 mL/minute; Patients <50 kg: Infuse at 0.04 mL/kg/minute. Maximum assessed rate of infusion: 4 mL/minute. Decrease rate of infusion if minor adverse reactions develop in patients with risk factors for thrombosis/thromboembolism and/or renal insufficiency.

DynPort product: Infuse at 1 mL/kg/hour for 30 minutes, then 2 mL/kg/hour for 30 minutes, then 3 mL/kg/hour until complete. Administer through 0.22 micron filtered set; use of infusion pump is recommended.

Dietary ConsiderationsDynPort solution for injection contains sodium 0.02-0.03 mEq/mL.

StorageStore between 2°C and 8°C (35.6°F to 46.4°F).

CNJ-016™ (Cangene product): If frozen, use within 60 days of thawing at 2°C and 8°C. Infusion should begin within 4 hours after entering vial.

DynPort product: Use within 6 hours of piercing vial stopper; complete infusion within 12 hours of spiking vial.

Compatibility

Y-site administration:

CNJ-016™ (Cangene product): **Compatible** (in a dilution not to exceed 1:2, v/v) with NS.

DynPort product: **Compatible** (in a dilution not to exceed 1:2, v/v) with NS or 2.5% to 20% dextrose solutions with or without sodium chloride.

ContraindicationsHypersensitivity to immune globulin or any component of the formulation; isolated vaccinia keratitis; selective IgA deficiency

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Contains trace amounts of IgA; use caution in IgA-deficient patients.
- Aseptic meningitis: Aseptic meningitis syndrome (AMS) has been reported with intravenous immune globulin administration (rare); may occur with high doses (≥2 g/kg).
- Hemolysis: Intravenous immune globulin has been associated with antiglobulin hemolysis; monitor for signs of hemolytic anemia.
- Pulmonary edema: Monitor for transfusion-related acute lung injury (TRALI); noncardiogenic pulmonary edema has been reported with intravenous immune globulin use.
- Renal impairment: Acute renal dysfunction (increased serum creatinine, oliguria, acute renal failure) can rarely occur; usually within 7 days of use (more likely with products stabilized with sucrose). Use with caution in the elderly, patients with renal disease, diabetes mellitus, volume depletion, sepsis, paraproteinemia, and nephrotoxic medications due to risk of renal dysfunction. In patients at risk of renal dysfunction, the rate of infusion and concentration of solution should be minimized. discontinue if renal function deteriorates.
- Thrombotic events: Thrombotic events have been reported with administration of intravenous immune globulin; use with caution in patients with cardiovascular risk factors.

Disease-related concerns:

- Hypovolemia: Patients should not be volume depleted prior to therapy.

- Postvaccinial encephalitis: Not effective for use in postvaccinial encephalitis.

Special populations:

- Elderly: Use with caution in the elderly; safety and efficacy have not been established.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.
- Maltose: Some products may contain maltose, which may result in falsely-elevated blood glucose readings.

Other warnings/precautions:

- Administration: For intravenous administration only.

Pregnancy Risk FactorC

Pregnancy ConsiderationsImmune globulins cross the placenta in increased amounts after 30 weeks gestation. There are no adequate and well-controlled studies in pregnant women; use only if benefits outweigh the risks.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Actual frequency varies by dose, rate of infusion, and specific product used

Cardiovascular: Flushing

Central nervous system: Cold or hot feeling, dizziness, fatigue, headache, pain, pallor, pyrexia

Dermatologic: Erythema, urticaria

Gastrointestinal: Abdominal pain, appetite decreased, nausea, vomiting

Local: Injection site reaction

Neuromuscular & skeletal: Arthralgia, back pain, paraesthesia, muscle cramp, rigors, tremor, weakness

Miscellaneous: Diaphoresis

Postmarketing and/or case reports (as reported with other IVIG products): Apnea, acute respiratory distress syndrome, bronchospasm, bullous dermatitis, cardiac arrest, coma, Coombs' test positive, cyanosis, dyspnea, epidermolysis, erythema multiforme, hemolysis, hepatic dysfunction, hypoxemia, hypotension, leukopenia, loss of consciousness, lung injury (transfusion associated), pancytopenia, pulmonary edema, seizure, Stevens-Johnson syndrome, syncope, thromboembolism, vascular collapse

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test InteractionsCNJ-016™ contains maltose. Falsely-elevated blood glucose levels may occur when glucose monitoring devices and test strips utilizing the glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ) based methods are used. Glucose monitoring devices and test strips which utilize the glucose-specific method are recommended.

Monitoring ParametersDuring infusion, monitor patient for signs of infusion-related reactions, including (but not limited to) flushing, fever, chills, respiratory distress, blood pressure or heart rate changes.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free; solvent-detergent treated]:

CNJ-016™ (Cangene product): ≥50,000 units/15 mL (15 mL) [contains maltose 10% and polysorbate 80 0.03%]

DynPort product: 50 mg/mL (50 mL) [contains sucrose 50 mg/mL, human albumin 10 mg/mL, sodium 0.02-0.03 mEq/mL]

Generic AvailableNo

Mechanism of ActionAntibodies obtained from pooled human plasma of individuals immunized with the smallpox vaccine provide passive immunity

Pharmacodynamics/Kinetics

Distribution: V_d: CNJ-016™ (Cangene product): 6630 L

Half-life elimination:

CNJ-016™ (Cangene product): 30 days (range 13-67 days)

DynPort product: 22 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Medication Safety Issues

Sound-alike/look-alike issues:

Valtrex® may be confused with Valcyte™

Valacyclovir may be confused with valganciclovir, vancomycin

Pronunciation(val ay SYE kloe veer)

U.S. Brand NamesValtrex®

Canadian Brand NamesAPO-Valacyclovir; PMS-Valacyclovir; RIVA-Valacyclovir; Valtrex®

Pharmacologic CategoryAntiviral Agent, Oral

Use: Labeled IndicationsTreatment of herpes zoster (shingles) in immunocompetent patients; treatment of first-episode and recurrent genital herpes; suppression of recurrent genital herpes and reduction of heterosexual transmission of genital herpes in immunocompetent patients; suppression of genital herpes in HIV-infected individuals; treatment of herpes labialis (cold sores); chickenpox in immunocompetent children

Use: Unlabeled/InvestigationalProphylaxis of cancer-related HSV, VZV, and CMV infections; treatment of cancer-related HSV, VZV infection

Use: DentalTreatment of herpes labialis (cold sores)

Dosing: Adults

CMV prophylaxis in allogeneic HSCT recipients (unlabeled use): 2 g 4 times/day

Herpes labialis (cold sores): Oral: 2 g twice daily for 1 day (separate doses by ~12 hours)

Herpes zoster (shingles): Oral: 1 g 3 times/day for 7 days

HSV, VZV in cancer patients (unlabeled use):

Prophylaxis: 500 mg 2-3 times/day

Treatment: 1 g 3 times/day

Genital herpes: Oral:

Initial episode: 1 g twice daily for 10 days

Recurrent episode: 500 mg twice daily for 3 days

Reduction of transmission: 500 mg once daily (source partner)

Suppressive therapy:

Immunocompetent patients: 1000 mg once daily (500 mg once daily in patients with <9 recurrences per year)

HIV-infected patients (CD4 ≥100 cells/mm^3): 500 mg twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Chickenpox: Children 2 to <18 years: 20 mg/kg/dose 3 times/day for 5 days (maximum: 1 g 3 times/day)

Herpes labialis (cold sores): Children ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Herpes zoster: Adults:

Cl_{cr} 30-49 mL/minute: 1 g every 12 hours

Cl_{cr} 10-29 mL/minute: 1 g every 24 hours

Cl_{cr} <10 mL/minute: 500 mg every 24 hours

Genital herpes: Adults:

Initial episode:

Cl_{cr} 10-29 mL/minute: 1 g every 24 hours

Cl_{cr} <10 mL/minute: 500 mg every 24 hours

Recurrent episode: Cl_{cr} <29 mL/minute: 500 mg every 24 hours

Suppressive therapy: Cl_{cr} <29 mL/minute:

For usual dose of 1 g every 24 hours, decrease dose to 500 mg every 24 hours

For usual dose of 500 mg every 24 hours, decrease dose to 500 mg every 48 hours

HIV-infected patients: 500 mg every 24 hours

Herpes labialis: Adolescents and Adults:

Cl_{cr} 30-49 mL/minute: 1 g every 12 hours for 2 doses

Cl_{cr} 10-29 mL/minute: 500 mg every 12 hours for 2 doses

Cl_{cr} <10 mL/minute: 500 mg as a single dose

Hemodialysis: Dialyzable (~33% removed during 4-hour session); administer dose postdialysis

Chronic ambulatory peritoneal dialysis/continuous arteriovenous hemofiltration dialysis: Pharmacokinetic parameters are similar to those in patients with ESRD; supplemental dose not needed following dialysis

Dosing: Hepatic ImpairmentNo adjustment required.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralIf GI upset occurs, administer with meals.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 25°C (59°F to 77°F).

Extemporaneously Prepared

To prepare a valacyclovir 25 mg/mL oral suspension, crush five valacyclovir 500 mg caplets (10 caplets for 50 mg/mL suspension) into a fine powder in a mortar. Gradually add 5 mL aliquots of Suspension Structured Vehicle USP-NF (SSV) to powder and triturate until a paste is formed. Continue adding 5 mL aliquots of SSV to the mortar until a suspension is formed (minimum 20 mL SSV and maximum 40 mL SSV). Transfer to 100 mL bottle. Add the cherry flavor (amount recommended on package) to the mortar and dissolve in ~5 mL of SSV. Add to bottle once dissolved. Rinse the mortar at least 3 times with ~5 mL of SSV, transferring contents between additions of SSV. Continue to add the SSV to bring final volume to 100 mL. The preparation is stable for 28 days under refrigeration; shake well before using. (Refer to manufacturer's current labeling.)

ContraindicationsHypersensitivity to valacyclovir, acyclovir, or any component of the formulation

Allergy Considerations

- Antiviral Acyclic Guanine Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Thrombotic thrombocytopenic purpura/hemolytic uremic syndrome: Has occurred in immunocompromised patients (at doses of 8 g/day).
- Urinary precipitation: Decreased precipitation in renal tubules may occur; adequately hydrate patient.

Disease-related concerns:

- Renal impairment: Use caution in patients with renal impairment, the elderly, and/or those receiving nephrotoxic agents. Acute renal failure and CNS effects have been observed in patients with renal dysfunction; dose adjustment may be required.

Special populations:

- Elderly: Use with caution in the elderly; CNS effects have been reported.
- Immunocompromised patients: Advanced HIV (CD4 <100 cells/mm^3): Safety and efficacy have not been established for treatment/suppression of recurrent genital herpes or disseminated herpes in patients with profound immunosuppression.
- Pediatrics: Safety and efficacy have not been established in patients <2 years of age.

Other warnings/precautions:

- Appropriate use: For cold sores, treatment should begin with earliest symptom (tingling, itching, burning). For genital herpes, treatment should begin as soon as possible after the first signs and symptoms (within 72 hours of onset of first diagnosis or within 24 hours of onset of recurrent episodes). For herpes zoster, treatment should begin within 72 hours of onset of rash. For chickenpox, treatment should begin with earliest sign or symptom.

Geriatric ConsiderationsMore convenient dosing and increased bioavailability, without increasing side effects, make valacyclovir a favorable choice compared to acyclovir. Has been shown to accelerate resolution of postherpetic pain. Adjust dose for renal impairment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic events were not observed in animal studies. Data from a pregnancy registry has shown no increased rate of birth defects than that of the general population; however, the registry is small and use during pregnancy is only warranted if the potential benefit to the mother justifies the risk of the fetus.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsPeak concentrations in breast milk range from 0.5-2.3 times the corresponding maternal acyclovir serum concentration. This is expected to provide a nursing infant with a dose of acyclovir equivalent to ~0.6 mg/kg/day following ingestion of valacyclovir 500 mg twice daily by the mother. Use with caution while breast-feeding.

Adverse Reactions

>10%:

Central nervous system: Headache (13% to 38%)

Gastrointestinal: Nausea (5% to 15%), abdominal pain (1% to 11%)

Hematologic: Neutropenia (≤18%)

Hepatic: ALT increased (≤14%), AST increased (2% to 16%)

Respiratory: Nasopharyngitis (≤16%)

1% to 10%:

Central nervous system: Fatigue (≤8%), depression (≤7%), fever (children 4%), dizziness (2% to 4%)

Dermatologic: Rash (≤8%)

Endocrine: Dysmenorrhea (≤1% to 8%), dehydration (children 2%)

Gastrointestinal: Vomiting (<1% to 6%), diarrhea (children 5%; adults <1%)

Hematologic: Thrombocytopenia (≤3%)

Hepatic: Alkaline phosphatase increased (≤4%)

Neuromuscular & skeletal: Arthralgia (<1 to 6%)

Respiratory: Rhinorrhea (children 2%)

Miscellaneous: Herpes simplex (children 2%)

<1%, postmarketing, and/or case reports: Acute hypersensitivity reactions (angioedema, anaphylaxis, dyspnea, pruritus, rash, urticaria); aggression, agitation, alopecia, anemia, aplastic anemia, ataxia, creatinine increased, coma, confusion, consciousness decreased, dysarthria, encephalopathy, erythema multiforme, facial edema, hallucinations (auditory and visual), hemolytic uremic syndrome (HUS), hepatitis, hypertension, leukocytoclastic vasculitis, leukopenia, mania, photosensitivity reaction, psychosis, renal failure, renal pain, seizure, tachycardia, thrombotic thrombocytopenic purpura (TTP), tremor, urinary precipitation, visual disturbances

Drug Interactions

Mycophenolate: Acyclovir-Valacyclovir may increase the serum concentration of Mycophenolate. Mycophenolate may increase the serum concentration of Acyclovir-Valacyclovir. *Risk C: Monitor therapy*

Tenofovir: Acyclovir-Valacyclovir may decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Zidovudine: Acyclovir-Valacyclovir may enhance the CNS depressant effect of Zidovudine. *Risk C: Monitor therapy*

Zoster Vaccine: Acyclovir-Valacyclovir may diminish the therapeutic effect of Zoster Vaccine. Management: When possible, discontinue antiviral agents with anti-zoster activity (i.e., acyclovir, valacyclovir, famciclovir) for at least 24 hours prior to and 14 days after receiving a live attenuated zoster vaccine. *Risk X: Avoid combination*

Monitoring ParametersUrinalysis, BUN, serum creatinine, liver enzymes, and CBC

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacologic agents or herbal products patient may be taking. Assess therapeutic effectiveness (resolution of clinical symptoms) and adverse responses (eg, CNS changes [dizziness, depression], nausea, vomiting, dysmenorrhea, arthralgia). Teach patient appropriate use (eg, timing of treatment according to purpose for use), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsUrinalysis, BUN, serum creatinine, liver enzymes, and CBC

Patient EducationThis medication is not a cure for genital herpes; it is not known if it will prevent transmission to others. Use appropriate precautions to prevent spread to other persons. Take as directed, with or without food. Begin use at first sign of herpes. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause headache, dizziness (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); or nausea, vomiting, or abdominal pain (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Immediately report difficulty swallowing or breathing; rash or hives; changes in menses; or other persistent unresolved adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Valtrex®: 500 mg, 1000 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Valtrex)

1 g (30): $365.87

500 mg (30): $208.10

Mechanism of ActionValacyclovir is rapidly and nearly completely converted to acyclovir by intestinal and hepatic metabolism. Acyclovir is converted to acyclovir monophosphate by virus-specific thymidine kinase then further converted to acyclovir triphosphate by other cellular enzymes. Acyclovir triphosphate inhibits DNA synthesis and viral replication by competing with deoxyguanosine triphosphate for viral DNA polymerase and being incorporated into viral DNA.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: Acyclovir is widely distributed throughout the body including brain, kidney, lungs, liver, spleen, muscle, uterus, vagina, and CSF

Protein binding: ~14% to 18%

Metabolism: Hepatic; valacyclovir is rapidly and nearly completely converted to acyclovir and L-valine by first-pass effect; acyclovir is hepatically metabolized to a very small extent by aldehyde oxidase and by alcohol and aldehyde dehydrogenase (inactive metabolites)

Bioavailability: ~55% once converted to acyclovir

Half-life elimination: Normal renal function: Adults: Acyclovir: 2.5-3.3 hours, Valacyclovir: ~30 minutes; End-stage renal disease: Acyclovir: 14-20 hours; During hemodialysis: 4 hours

Excretion: Urine, primarily as acyclovir (89%); **Note:** Following oral administration of radiolabeled valacyclovir, 46% of the label is eliminated in the feces (corresponding to nonabsorbed drug), while 47% of the radiolabel is eliminated in the urine.

Medication Safety Issues

Sound-alike/look-alike issues:

Valcyte™ may be confused with Valium®, Valtrex®

Valganciclovir may be confused with valacyclovir

Pronunciation(val gan SYE kloh veer)

U.S. Brand NamesValcyte™

Canadian Brand NamesValcyte™

Pharmacologic CategoryAntiviral Agent

Use: Labeled IndicationsTreatment of cytomegalovirus (CMV) retinitis in patients with acquired immunodeficiency syndrome (AIDS); prevention of CMV disease in high-risk patients (donor CMV positive/recipient CMV negative) undergoing kidney, heart, or kidney/pancreas transplantation

Dosing: Adults

CMV retinitis: Oral:

Induction (active retinitis): 900 mg twice daily for 21 days (with food)

Maintenance: Following induction treatment, or for patients with inactive CMV retinitis who require maintenance therapy: Recommended dose: 900 mg once daily (with food)

Prevention of CMV disease following transplantation: Oral: 900 mg once daily (with food) beginning within 10 days of transplantation; continue therapy until 100 days post-transplantation.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Induction dose:

Cl_{cr} 40-59 mL/minute: 450 mg twice daily

Cl_{cr} 25-39 mL/minute: 450 mg once daily

Cl_{cr} 10-24 mL/minute: 450 mg every 2 days

Maintenance dose:

Cl_{cr} 40-59 mL/minute: 450 mg once daily

Cl_{cr} 25-39 mL/minute: 450 mg every 2 days

Cl_{cr} 10-24 mL/minute: 450 mg twice weekly

Note: Valganciclovir is not recommended in patients receiving hemodialysis. For patients on hemodialysis (Cl_{cr} <10 mL/minute), it is recommended that ganciclovir be used (dose adjusted as specified for ganciclovir).

Calculations

- Creatinine Clearance: Adults

Administration: OralAvoid direct contact with broken or crushed tablets. Consideration should be given to handling and disposal according to guidelines issued for antineoplastic drugs. However, there is no consensus on the need for these precautions.

Dietary ConsiderationsShould be taken with meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to valganciclovir, ganciclovir, acyclovir, or any component of the formulation; absolute neutrophil count <500/mm^3; platelet count <25,000/mm^3; hemoglobin <8 g/dL

Allergy Considerations

- Antiviral Acyclic Guanine Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Blood dyscrasias: See "Concerns related to adverse effects" below.
- Carcinogenic/teratogenic/fertility effects: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Blood dyscrasias: **[U.S. Boxed Warning]: May cause dose- or therapy-limiting granulocytopenia, anemia, and/or thrombocytopenia;** use with caution in patients with pre-existing bone marrow suppression, cytopenias, or in those receiving myelosuppressive drugs/irradiation.
- Carcinogenic/teratogenic/fertility effects: **[U.S. Boxed Warning]: Ganciclovir may adversely affect spermatogenesis and fertility;** due to its mutagenic potential, contraceptive precautions for female and male patients need to be followed during and for at least 90 days after therapy with the drug.

Disease-related concerns:

- Renal impairment: Use with caution in patients with impaired renal function; dosage adjustment required.

Special populations:

- Liver transplant recipients: Not indicated for use in liver transplant patients (higher incidence of tissue-invasive CMV relative to oral ganciclovir was observed in trials).
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Product bioavailability variation: Due to differences in bioavailability, valganciclovir tablets cannot be substituted for ganciclovir capsules on a one-to-one basis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsValganciclovir is converted to ganciclovir and shares its reproductive toxicity. **[U.S. Boxed Warning]: Ganciclovir may adversely affect spermatogenesis and fertility;** due to its mutagenic potential, contraceptive precautions for female and male patients need to be followed during and for at least 90 days after therapy with this drug.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease the potential transmission of HIV.

Adverse Reactions

>10%:

Central nervous system: Fever (31%), headache (9% to 22%), insomnia (16%)

Gastrointestinal: Diarrhea (16% to 41%), nausea (8% to 30%), vomiting (21%), abdominal pain (15%)

Hematologic: Granulocytopenia (11% to 27%), anemia (8% to 26%)

Ocular: Retinal detachment (15%)

1% to 10%:

Central nervous system: Peripheral neuropathy (9%), paresthesia (8%), seizure (<5%), psychosis, hallucinations (<5%), confusion (<5%), agitation (<5%)

Hematologic: Thrombocytopenia (8%), pancytopenia (<5%), bone marrow depression (<5%), aplastic anemia (<5%), bleeding (potentially life-threatening due to thrombocytopenia <5%)

Renal: Renal function decreased (<5%)

Miscellaneous: Local and systemic infection, including sepsis (<5%); allergic reaction (<5%)

<1%: Valganciclovir is expected to share the toxicities which may occur at a low incidence or due to idiosyncratic reactions which have been associated with ganciclovir

Drug Interactions

Mycophenolate: May increase the serum concentration of Ganciclovir-Valganciclovir. Ganciclovir-Valganciclovir may increase the serum concentration of Mycophenolate. *Risk C: Monitor therapy*

Reverse Transcriptase Inhibitors (Nucleoside): Ganciclovir-Valganciclovir may enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. **Exceptions:** Stavudine; Zalcitabine. *Risk D: Consider therapy modification*

Tenofovir: Ganciclovir-Valganciclovir may decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Coadministration with a high-fat meal increased AUC by 30%.

Monitoring ParametersRetinal exam (at least every 4-6 weeks), CBC, platelet counts, serum creatinine

Nursing: Physical Assessment/MonitoringUse caution with renal impairment. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased risk of nephrotoxicity and hematologic toxicity). Assess results of laboratory tests, therapeutic effectiveness (reduction in clinical symptoms), and adverse response (eg, peripheral neuropathy, neutropenia, anemia, nephrotoxicity, retinal detachment, vomiting, bloody diarrhea) on a regular basis during therapy. Teach proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsRetinal exam (at least every 4-6 weeks), CBC, platelet counts, serum creatinine

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is not a cure for CMV retinitis. Take exactly as directed; do not alter dosage or discontinue without consulting prescriber. You will need frequent and regular laboratory tests and ophthalmic exams while taking this medication. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds or exposure to infection and do not have any vaccinations unless approved by prescriber). May cause headache or insomnia (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea or vomiting (small, frequent meals, good mouth care, sucking lozenges, or chewing gum may help); diarrhea (boiled milk, yogurt, or buttermilk may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report fever; chills; unusual bleeding or bruising; infection or unhealed sores; white plaques in mouth or vaginal discharge; CNS disturbances (eg, hallucinations, confusion, nightmares); or weakness or loss of feeling in nerves or muscles. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Males and females should use appropriate barrier contraceptive measures during and for 90 days following end of therapy. Consult prescriber if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 450 mg [valganciclovir hydrochloride 496.3 mg equivalent to valganciclovir 450 mg]

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Valcyte)

450 mg (60): $2189.19

Mechanism of ActionValganciclovir is rapidly converted to ganciclovir in the body. The bioavailability of ganciclovir from valganciclovir is increased 10-fold compared to oral ganciclovir. A dose of 900 mg achieved systemic exposure of ganciclovir comparable to that achieved with the recommended doses of intravenous ganciclovir of 5 mg/kg. Ganciclovir is phosphorylated to a substrate which competitively inhibits the binding of deoxyguanosine triphosphate to DNA polymerase resulting in inhibition of viral DNA synthesis.

Pharmacodynamics/Kinetics

Absorption: Well absorbed; high-fat meal increases AUC by 30%

Distribution: Ganciclovir: V_d: 15.26 L/1.73 m^2; widely to all tissue including CSF and ocular tissue

Protein binding: 1% to 2%

Metabolism: Converted to ganciclovir by intestinal mucosal cells and hepatocytes

Bioavailability: With food: 60%

Half-life elimination: Ganciclovir: 4.08 hours; prolonged with renal impairment; Severe renal impairment: Up to 68 hours

Excretion: Urine (primarily as ganciclovir)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common; may cause confusion and psychosis

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; use caution with SSRIs, lithium, and valproic acid. Granulocytopenia is common; use caution with clozapine, carbamazepine, and valproic acid.

Index TermsValganciclovir Hydrochloride

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Depakene® may be confused with Depakote®

Depakote® may be confused with Depakene®, Depakote® ER, Senokot®

Depakote® ER may be confused with Depakote®

Pronunciation(val PROE ik AS id & dah RIV ah tives)

U.S. Brand NamesDepacon®; Depakene®; Depakote®; Depakote® ER; Depakote® Sprinkle; Stavzor™

Canadian Brand NamesAlti-Divalproex; Apo-Divalproex®; Apo-Valproic®; Depakene®; Dom-Divalproex; Epival® I.V.; Gen-Divalproex; Novo-Divalproex; Nu-Divalproex; PHL-Divalproex; PHL-Valproic Acid; PHL-Valproic Acid E.C.; PMS-Valproic Acid; PMS-Valproic Acid E.C.; ratio-Valproic; ratio-Valproic ECC; Rhoxal-valproic; Sandoz-Valproic

Pharmacologic CategoryAnticonvulsant, Miscellaneous; Antimanic Agent; Histone Deacetylase Inhibitor

Use: Labeled Indications

Depacon®, Depakene®, Depakote®, Depakote® ER, Depakote® Sprinkle, Stavzor™: Monotherapy and adjunctive therapy in the treatment of patients with complex partial seizures; monotherapy and adjunctive therapy of simple and complex absence seizures; adjunctive therapy in patients with multiple seizure types that include absence seizures

Depakote®, Depakote® ER, Stavzor™: Mania associated with bipolar disorder; migraine prophylaxis

Use: Unlabeled/InvestigationalStatus epilepticus

Dosing: Adults

Seizures: Administer doses >250 mg/day in divided doses.

Oral:

Simple and complex absence seizure: Initial: 15 mg/kg/day; increase by 5-10 mg/kg/day at weekly intervals until therapeutic levels are achieved; maximum: 60 mg/kg/day.

Complex partial seizure: Initial: 10-15 mg/kg/day; increase by 5-10 mg/kg/day at weekly intervals until therapeutic levels are achieved; maximum: 60 mg/kg/day.

Note: Regular release and delayed release formulations are usually given in 2-4 divided doses/day; extended release formulation (Depakote® ER) is usually given once daily. Conversion to Depakote® ER from a stable dose of Depakote® may require an increase in the total daily dose between 8% and 20% to maintain similar serum concentrations.

I.V.: Administer as a 60-minute infusion (≤20 mg/minute) with the same frequency as oral products; switch patient to oral products as soon as possible. Rapid infusions ≤45 mg/kg over 5-10 minutes (1.5-6 mg/kg/minute) were generally well tolerated in clinical trials.

Rectal (unlabeled): Dilute syrup 1:1 with water for use as a retention enema; loading dose: 17-20 mg/kg one time; maintenance: 10-15 mg/kg/dose every 8 hours

Status epilepticus (unlabeled use):

Loading dose: I.V.: 15-45 mg/kg administered at ≤ 6 mg/kg/minute

Maintenance dose: I.V. infusion: 1-4 mg/kg/hour; titrate dose as needed based upon patient response and evaluation of drug-drug interactions

Mania:*Oral:*

Depakote® tablet, Stavzor™: Initial: 750 mg/day in divided doses; dose should be adjusted as rapidly as possible to desired clinical effect; maximum recommended dosage: 60 mg/kg/day

Depakote® ER: Initial: 25 mg/kg/day given once daily; dose should be adjusted as rapidly as possible to desired clinical effect; maximum recommended dose: 60 mg/kg/day.

Migraine prophylaxis: *Oral:*

Depakote® tablet, Stavzor™: 250 mg twice daily; adjust dose based on patient response, up to 1000 mg/day

Depakote® ER: 500 mg once daily for 7 days, then increase to 1000 mg once daily; adjust dose based on patient response; usual dosage range 500-1000 mg/day

Dosing: ElderlyInitiate at lower doses; dose escalation should be managed more slowly (in persons of advanced age). Refer to adult dosing.

Dosing: Pediatric

Seizures:

Oral, I.V.:

Simple and complex absence seizures: Refer to adult dosing. Larger maintenance doses may be required in younger children.

Complex partial seizures: Children ≥10 years: Refer to adult dosing. Larger maintenance doses may be required in younger children.

Note: Depakote® ER is not recommended for use in children <10 years of age.

Rectal (unlabeled): Refer to adult dosing.

Migraine prophylaxis: Oral: Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentA 27% reduction in clearance of unbound valproate is seen in patients with Cl_{cr} <10 mL/minute. Hemodialysis reduces valproate concentrations by 20%, therefore, no dose adjustment is needed in patients with renal failure. Protein binding is reduced, monitoring only total valproate concentrations may be misleading.

Dosing: Hepatic ImpairmentDosage reduction is required. Clearance is decreased with liver impairment. Hepatic disease is also associated with decreased albumin concentrations and 2- to 2.6-fold increase in the unbound fraction. Free concentrations of valproate may be elevated while total concentrations appear normal. Use is contraindicated in severe impairment.

Administration: I.V.Depacon®: Following dilution to final concentration, administer over 60 minutes at a rate ≤20 mg/minute. Alternatively, single doses up to 45 mg/kg have been administered as a rapid infusion over 5-10 minutes (1.5-6 mg/kg/minute).

Administration: Oral

Depakote® ER: Swallow whole; do not crush or chew. Patients who need dose adjustments smaller than 500 mg/day for migraine prophylaxis should be changed to Depakote® delayed release tablets.

Depakote® Sprinkle capsules may be swallowed whole or open capsule and sprinkle on small amount (1 teaspoonful) of soft food and use immediately (do not store or chew).

Depakene® capsule, Stavzor™: Swallow whole; do not chew.

Dietary ConsiderationsValproic acid may cause GI upset; take with large amount of water or food to decrease GI upset. May need to split doses to avoid GI upset.

Depakote® Sprinkle capsule contents may be mixed with semisolid food (eg, applesauce or pudding) in patients having difficulty swallowing; particles should be swallowed and not chewed.

Valproate sodium oral solution will generate valproic acid in carbonated beverages and may cause mouth and throat irritation; do not mix valproate sodium oral solution with carbonated beverages.

Storage

Depakote® tablet, Depakene® solution: Store below 30°C (86°F).

Depakote® Sprinkles: Store below 25°C (77°F).

Depakote® ER, Stavzor™: Store at controlled room temperature of 25°C (77°F).

Depakene® capsule: Store at controlled room temperature of 15˚C to 25°C (59°F to 77°F).

Depacon®: Store vial at room temperature of 15°C to 30°C (59°F to 86°F). Stable in D_5W, NS, and LR for at least 24 hours when stored in glass or PVC.

ReconstitutionDepacon®: Injection should be diluted in 50 mL of a compatible diluent.

CompatibilityStable in D_5W, NS, and LR.

Y-site administration: Compatible with cefepime, ceftazidime

ContraindicationsHypersensitivity to valproic acid, derivatives, or any component of the formulation; hepatic disease or significant impairment; urea cycle disorders

Allergy Considerations

- Valproic Acid Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Hepatic failure: See "Concerns related to adverse effects" below.
- Pancreatitis: See "Concerns related to adverse effects" below.
- Pregnancy: See "Special populations" below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatic failure: **[U.S. Boxed Warning]: Hepatic failure resulting in fatalities has occurred in patients; children <2 years of age are at considerable risk.** Other risk factors include organic brain disease, mental retardation with severe seizure disorders, congenital metabolic disorders, and patients on multiple anticonvulsants. Hepatotoxicity has usually been reported within 6 months of therapy initiation. Monitor patients closely for appearance of malaise, weakness, facial edema, anorexia, jaundice, and vomiting; discontinue immediately with signs/symptom of significant or suspected impairment. Liver function tests should be performed at baseline and at regular intervals after initiation of therapy, especially within the first 6 months. Hepatic dysfunction may progress despite discontinuing treatment. Should only be used as monotherapy in children <2 years of age and patients at high risk for hepatotoxicity.
- Hyperammonemia/encephalopathy: Hyperammonemia and/or encephalopathy, sometimes fatal, has been reported following the initiation of valproic acid therapy and may be present with normal transaminase levels. Ammonia levels should be measured in patients who develop unexplained lethargy and vomiting, or changes in mental status or in patients who present with hypothermia. Discontinue therapy if ammonia levels are increased and evaluate for possible urea cycle disorder (UCD). Contraindicated in patients with UCD. Evaluation of UCD should be considered for the following patients prior to the start of therapy: History of unexplained encephalopathy or coma; encephalopathy associated with protein load; pregnancy or postpartum encephalopathy; unexplained mental retardation; history of elevated plasma ammonia or glutamine; history of cyclical vomiting and lethargy; episodic extreme irritability, ataxia; low BUN or protein avoidance; family history of UCD or unexplained infant deaths (particularly male); or signs or symptoms of UCD (hyperammonemia, encephalopathy, respiratory alkalosis).
- Hypothermia: Hypothermia (unintentional drop in core body temperature to <35°C/95°F) has been reported with valproic acid therapy; may or may not be associated with hyperammonemia; may also occur with concomitant topiramate therapy.
- Multiorgan hypersensitivity reactions: Potentially serious, sometimes fatal multiorgan hypersensitivity reactions have rarely been reported with some antiepileptic drugs including valproic acid therapy in adults and children; monitor for signs and symptoms of possible disparate manifestations associated with lymphatic, hepatic, renal, and/or hematologic organ systems; discontinuation and conversion to alternate therapy may be required.
- Pancreatitis: **[U.S. Boxed Warning]: Cases of life-threatening pancreatitis, occurring at the start of therapy or following years of use, have been reported in adults and children.** Some cases have been hemorrhagic with rapid progression of initial symptoms to death. Promptly evaluate symptoms of abdominal pain, nausea, vomiting, and/or anorexia; should generally be discontinued if pancreatitis is diagnosed.
- Suicidal ideation: FDA reports demonstrate a statistically significant increased risk of suicidality; relative risk appears to be higher in patients with epilepsy compared to patients treated for psychiatric or other considerations. Monitor all patients for notable changes in behavior that might indicate suicidal thoughts or depression.
- Thrombocytopenia: May cause severe thrombocytopenia (may be dose-related), inhibition of platelet aggregation, and bleeding. In some cases, platelet counts may be normalized with continued treatment, however, reduce dose or discontinue drug if patient develops evidence of hemorrhage, bruising, or a disorder of hemostasis/coagulation. Evaluate platelet counts prior to initiating therapy and periodically thereafter.
- Tremors: May indicate overdosage.

Disease-related concerns:

- Hepatic impairment: Contraindicated with severe impairment.

Concurrent drug therapy issues:

- Carbapenem antibiotics: Concomitant use may reduce valproic acid levels to subtherapeutic levels; monitor levels frequently and consider alternate therapy if levels drop significantly or lack of seizure control occurs.
- Clonazepam: Concomitant use with clonazepam may induce absence status.
- Topiramate: Concomitant use with topiramate has been associated with hyperammonemia and hypothermia with or without encephalopathy.

Special populations:

- Elderly: Use with caution as elderly patients may be more sensitive to sedating effects; dose adjustment may be necessary.

- Pregnancy: **[U.S. Boxed Warning]: May cause teratogenic effects such as neural tube defects (eg, spina bifida).** Use in women of childbearing potential requires that benefits of use in mother be weighed against the potential risk to fetus, especially when used for conditions not associated with permanent injury or risk of death (eg, migraine).

Dosage form specific issues:

- Depacon® injection: Use of Depacon® injection is not recommended for post-traumatic seizure prophylaxis following acute head trauma.

Other warnings/precautions:

- Viral replication: *In vitro* studies have suggested valproic acid stimulates the replication of HIV and CMV viruses under experimental conditions. The clinical consequence of this is unknown, but should be considered when monitoring affected patients.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsAlthough there is little data in elderly for the use of valproic acid in the treatment of seizures, there are a number of studies which demonstrate its benefit in the treatment of agitation and dementia and other psychiatric disorders. It is important that the clinician understand that serum concentrations do not correlate with behavior response; likewise, it is imperative to monitor LFTs and CBC during the first 6 months of therapy. See Warnings/Precautions, Monitoring Parameters, and Additional Information.

Elimination is decreased in elderly. Studies of older adults with dementia show a high incidence of somnolence (which is usually transient); cognitive side effects generally minimal. In some patients, this was associated with weight loss. Starting doses should be lower and increased slowly, with careful monitoring of nutritional intake and dehydration. Safety and efficacy for use in patients >65 years of age have not been studied for migraine prophylaxis.

Pregnancy Risk FactorD

Pregnancy Considerations**[U.S. Boxed Warning]: May cause teratogenic effects such as neural tube defects (eg, spina bifida).** Teratogenic effects have been reported in animals and humans. Valproic acid crosses the placenta. Neural tube, cardiac, facial (characteristic pattern of dysmorphic facial features), skeletal, multiple other defects reported. Epilepsy itself, number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy. Information from the North American Antiepileptic Drug Pregnancy Registry notes a fourfold increase in congenital malformations with exposure to valproic acid monotherapy during the 1st trimester of pregnancy when compared to monotherapy with other antiepileptic drugs (AED). The risk of neural tube defects is ~1% to 2% (general population risk estimated to be 0.14% to 0.2%). The effect of folic acid supplementation to decrease this risk is unknown, however, folic acid supplementation is recommended for all women contemplating pregnancy. An information sheet describing the teratogenic potential is available from the manufacturer.

Nonteratogenic effects have also been reported. Afibrinogenemia leading to fatal hemorrhage and hepatotoxicity have been noted in case reports of infants following *in utero* exposure to valproic acid. Use in women of childbearing potential requires that benefits of use in mother be weighed against the potential risk to fetus, especially when used for conditions not associated with permanent injury or risk of death (eg, migraine). Health professionals and patients are encouraged to contact the North American Antiepileptic Drug Pregnancy registry to monitor outcomes of pregnant women exposed to valproic acid and other AEDs (1-888-233-2334).

LactationEnters breast milk/not recommended (AAP considers “compatible”)

Breast-Feeding ConsiderationsBreast milk concentrations of valproic acid have been reported as 1% to 10% of maternal concentration. The weight-adjusted dose to the infant has been calculated to be ~4%.

Adverse Reactions

>10%:

Central nervous system: Headache (≤31%), somnolence (≤30%), dizziness (12% to 25%), insomnia (>1% to 15%), nervousness (>1% to 11%), pain (1% to 11%)

Dermatologic: Alopecia (>1% to 24%)

Gastrointestinal: Nausea (15% to 48%), vomiting (7% to 27%), diarrhea (7% to 23%), abdominal pain (7% to 23%), dyspepsia (7% to 23%), anorexia (>1% to 12%)

Hematologic: Thrombocytopenia (1% to 24%; dose related)

Neuromuscular & skeletal: Tremor (≤57%), weakness (6% to 27%)

Ocular: Diplopia (>1% to 16%), amblyopia/blurred vision (≤12%)

Miscellaneous: Infection (≤20%), flu-like syndrome (12%)

1% to 10%:

Cardiovascular: Peripheral edema (>1% to 8%), chest pain (>1% to <5%), edema (>1% to <5%), facial edema (>1% to <5%), hypertension (>1% to <5%), hypotension (>1% to <5%), palpitation (>1% to <5%), postural hypotension (>1% to <5%), tachycardia (>1% to <5%), vasodilation(>1% to <5%), arrhythmia

Central nervous system: Ataxia (>1% to 8%), amnesia (>1% to 7%), emotional lability (>1% to 6%), fever (>1% to 6%), abnormal thinking (≤6%), depression (>1% to 5%), abnormal dreams (>1% to <5%), agitation (>1% to <5%), anxiety (>1% to <5%), catatonia (>1% to <5%), chills (>1% to <5%), confusion (>1% to <5%), coordination abnormal (>1% to <5%), hallucination (>1% to <5%), malaise (>1% to <5%), personality disorder (>1% to <5%), speech disorder (>1% to <5%), tardive dyskinesia (>1% to <5%), vertigo (>1% to <5%), euphoria (1%), hypoesthesia (1%)

Dermatologic: Rash (>1% to 6%), bruising (>1% to 5%), discoid lupus erythematosus (>1% to <5%), dry skin (>1% to <5%), furunculosis (>1% to <5%), petechia (>1% to <5%), pruritus (>1% to <5), seborrhea (>1% to <5%)

Endocrine & metabolic: Amenorrhea (>1% to <5%), dysmenorrhea (>1% to <5%), metrorrhagia (>1% to <5%), hypoproteinemia

Gastrointestinal: Weight gain (4% to 9%), weight loss (6%), appetite increased (≤6%), constipation (>1% to 5%), xerostomia (>1% to 5%), eructation (>1% to <5%), fecal incontinence (>1% to <5%), flatulence (>1% to <5%), gastroenteritis (>1% to <5%), glossitis (>1% to <5%), hematemesis (>1% to <5%), pancreatitis (>1% to <5%), periodontal abscess (>1% to <5%), stomatitis (>1% to <5%), taste perversion (>1% to <5%), dysphagia, gum hemorrhage, mouth ulceration

Genitourinary: Cystitis (>1% to 5%), dysuria (>1% to 5%), urinary frequency (>1% to <5%), urinary incontinence (>1% to <5%), vaginal hemorrhage (>1% to 5%), vaginitis (>1% to <5%)

Hepatic: ALT increased (>1% to <5%), AST increased (>1% to <5%)

Local: Injection site pain (3%), injection site reaction (2%), injection site inflammation (1%)

Neuromuscular & skeletal: Back pain (≤8%), abnormal gait (>1% to <5%), arthralgia (>1% to <5%), arthrosis (>1% to <5%), dysarthria (>1% to <5%), hypertonia (>1% to <5%), hypokinesia (>1% to <5%), leg cramps (>1% to <5%), myalgia (>1% to <5%), myasthenia (>1% to <5%), neck pain (>1% to <5%), neck rigidity (>1% to <5%), paresthesia (>1% to <5%), reflex increased (>1% to <5%), twitching (>1% to <5%)

Ocular: Nystagmus (1% to 8%), dry eyes (>1% to 5%), eye pain (>1% to 5%), abnormal vision (>1% to <5%), conjunctivitis (>1% to <5%)

Otic: Tinnitus (1% to 7%), ear pain (>1% to 5%), deafness (>1% to <5%), otitis media (>1% to <5%)

Respiratory: Pharyngitis (2% to 8%), bronchitis (5%), rhinitis (>1% to 5%), dyspnea (1% to 5%), cough (>1% to <5%), epistaxis (>1% to <5%), pneumonia (>1% to <5%), sinusitis (>1% to <5%)

Miscellaneous: Diaphoresis (1%), hiccups

<1%, postmarketing, and/or case reports (limited to important and/or life-threatening): Aggression, agranulocytosis, allergic reaction, anaphylaxis, anemia, aplastic anemia, asterixis, behavioral deterioration, bilirubin increased, bleeding time altered, bone marrow suppression, bone pain, bradycardia, breast enlargement, cutaneous vasculitis, carnitine decreased, cerebral atrophy (reversible), coma (rare), dementia, encephalopathy (rare), enuresis, eosinophilia, erythema multiforme, Fanconi-like syndrome (rare, in children), galactorrhea, hematoma formation, hemorrhage, hepatic failure, hepatotoxicity, hostility, hyperactivity, hyperammonemia, hyperammonemic encephalopathy (in patients with UCD), hyperglycinemia, hypersensitivity reactions (severe, with multiorgan dysfunction), hypofibrinogenemia, hyponatremia, hypothermia, inappropriate ADH secretion, intermittent porphyria, LDH increased, leukopenia, lupus, lymphocytosis, macrocytosis, menstrual irregularities, pancytopenia parkinsonism, parotid gland swelling, photosensitivity, platelet aggregation inhibited, polycystic ovary disease (rare), psychosis, seeing "spots before the eyes," Stevens-Johnson syndrome, suicidal behavior/ideation, thyroid function tests abnormal, toxic epidermal necrolysis (rare), urinary tract infection

Metabolism/Transport EffectsFor valproic acid: **Substrate** (minor) of CYP2A6, 2B6, 2C9, 2C19, 2E1; **Inhibits** CYP2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (weak); **Induces** CYP2A6 (weak)

Drug Interactions

Aminocamptothecin: Valproic Acid may decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Barbiturates: Valproic Acid may decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Valproic Acid. Valproic Acid may decrease the serum concentration of CarBAMazepine. Carbamazepine-Epoxide concentrations might increase, offsetting the decreases in the parent compound. *Risk C: Monitor therapy*

Carbapenems: May decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

ChlorproMAZINE: May increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Ethosuximide: May decrease the serum concentration of Valproic Acid. Valproic Acid may increase the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Valproic Acid. *Risk D: Consider therapy modification*

LamoTRIgine: Valproic Acid may enhance the adverse/toxic effect of LamoTRIgine. Valproic Acid may increase the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

LORazepam: Valproic Acid may decrease the metabolism of LORazepam. *Risk D: Consider therapy modification*

Methylfolate: May decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

OXcarbazepine: Valproic Acid may decrease the serum concentration of OXcarbazepine. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Valproic Acid. A hepatotoxic metabolite of valproic acid may result. Valproic Acid may decrease the serum concentration of Phenytoin. Continued therapy usually yields a normalization (or slight increase) of serum phenytoin concentrations. Free phenytoin concentrations, however, tend to remain relatively stable (possibly increased with continued therapy). *Risk C: Monitor therapy*

Primidone: Valproic Acid may decrease the metabolism of Primidone. More specifically, the metabolism of phenobarbital, primidone's primary active metabolite, would be decreased. Primidone may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Rifampin: May decrease the serum concentration of Valproic Acid. *Risk D: Consider therapy modification*

Risperidone: Valproic Acid may enhance the adverse/toxic effect of Risperidone. Generalized edema has developed. *Risk C: Monitor therapy*

Rufinamide: Valproic Acid may increase the serum concentration of Rufinamide. *Risk D: Consider therapy modification*

Salicylates: May increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Topiramate: May enhance the hepatotoxic effect of Valproic Acid. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Valproic Acid may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vorinostat: Valproic Acid may enhance the thrombocytopenic effect of Vorinostat. This may increase the risk of gastrointestinal bleeding. *Risk C: Monitor therapy*

Zidovudine: Valproic Acid may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food may delay but does not affect the extent of absorption. Valproic acid serum concentrations may be decreased if taken with food. Milk has no effect on absorption.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased).

Test InteractionsFalse-positive result for urine ketones; accuracy of thyroid function tests

Monitoring ParametersLiver enzymes (at baseline and during therapy), CBC with platelets (baseline and periodic intervals), PT/PTT (especially prior to surgery), serum ammonia (with symptoms of lethargy, mental status change), serum valproate levels

Reference Range

Therapeutic:

Epilepsy: 50-100 mcg/mL (SI: 350-690 µmol/L)

Mania: 85-125 mcg/mL (SI: 350-860 µmol/L)

Toxic: Some laboratories may report >200 mcg/mL (SI: >1390 µmol/L) as a toxic threshold, although clinical toxicity can occur at lower concentrations. Probability of thrombocytopenia increases with total valproate levels ≥110 mcg/mL in females or ≥135 mcg/mL in males.

Seizure control: May improve at levels >100 mcg/mL (SI: 690 µmol/L), but toxicity may occur at levels of 100-150 mcg/mL (SI: 690-1040 µmol/L)

Mania: Clinical response seen with trough levels between 85-125 mcg/mL; risk of toxicity increases at levels >125 mcg/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. **I.V.:** Keep patient under observation, observe safety/seizure precautions, and monitor therapeutic effectiveness (type of seizure activity, force, and duration). Monitor vital signs; neurological, cardiac, and respiratory status. Monitor for signs and symptoms of hepatic failure (malaise, weakness, facial edema, anorexia, jaundice, and vomiting), especially when used in children <2 years of age. Monitor for signs and symptoms of pancreatitis (abdominal pain, nausea, vomiting, and/or anorexia). For outpatients, monitor therapeutic effect, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient seizure safety precautions, appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Note:** Valproic acid will alter results of urine ketones (use serum glucose testing) and reduce effectiveness of oral contraceptives (use alternative form of contraception to prevent pregnancy). Some adverse reactions, including hepatic failure and thrombocytopenia, can occur 3 days to 6 months after beginning therapy.

Monitoring: Lab TestsLiver enzymes (at baseline and during therapy), CBC with platelets (baseline and periodic intervals), PT/PTT (especially prior to surgery), serum ammonia (with symptoms of lethargy, mental status change), serum valproate levels

Patient EducationWhen used to treat generalized seizures, patient instructions are determined by patient's condition and ability to understand. **Oral:** Take as directed; do not alter dose or timing of medication. Do not increase dose or take more than recommended. Do not crush or chew capsule or enteric-coated pill. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, monitor serum glucose closely (valproic acid will alter results of urine ketones). You may experience nervousness; decreased appetite; insomnia; headache; sleepiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); visual changes; and hair loss. Report suicidal ideation or depression; alterations in menstrual cycle; abdominal cramps, unresolved diarrhea, vomiting, or constipation; skin rash; tremors; unusual bruising or bleeding; blood in urine, stool, or vomitus; malaise; weakness; facial swelling; yellowing of skin or eyes; persistent abdominal pain; excessive sedation; change in mental status; extreme lethargy; or restlessness. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures if necessary or if you suspect you might be pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note:** Strength expressed as valproic acid

Capsule, softgel, as valproic acid: 250 mg

Depakene®: 250 mg

Capsule, softgel, delayed release, as valproic acid:

Stavzor™: 125 mg, 250 mg, 500 mg

Capsule, sprinkles, as divalproex sodium:

Depakote® Sprinkle: 125 mg

Injection, solution, as valproate sodium: 100 mg/mL (5 mL)

Depacon®: 100 mg/mL (5 mL) [contains edetate disodium]

Syrup, as valproic acid: 250 mg/5 mL (5 mL, 10 mL, 480 mL)

Depakene®: 250 mg/5 mL (480 mL)

Tablet, delayed release, as divalproex sodium: 125 mg, 250 mg, 500 mg

Depakote®: 125 mg, 250 mg, 500 mg

Tablet, delayed release, enteric coated, as divalproex sodium: 125 mg, 250 mg, 500 mg

Tablet, extended release, as divalproex sodium:

Depakote® ER: 250 mg, 500 mg

Generic Available Yes: Capsule (excluding delayed release or sprinkle), injection, syrup

Pricing: U.S. (www.drugstore.com)

Capsule, sprinkles (Depakote Sprinkles)

125 mg (60): $56.59

Capsules (Depakene)

250 mg (30): $75.96

Capsules (Valproic Acid)

250 mg (30): $14.99

Syrup (Depakene)

250 mg/5 mL (150): $83.46

Syrup (Valproate Sodium)

250 mg/5 mL (150): $17.99

Tablet, 24-hour (Depakote ER)

250 mg (30): $54.01

500 mg (30): $90.75

Tablet, EC (Depakote)

125 mg (60): $59.67

250 mg (60): $105.69

500 mg (60): $195.98

Mechanism of ActionCauses increased availability of gamma-aminobutyric acid (GABA), an inhibitory neurotransmitter, to brain neurons or may enhance the action of GABA or mimic its action at postsynaptic receptor sites

Pharmacodynamics/Kinetics

Distribution: Total valproate: 11 L/1.73 m^2; free valproate 92 L/1.73 m^2

Protein binding (dose dependent): 80% to 90%; decreased in the elderly and with hepatic or renal dysfunction

Metabolism: Extensively hepatic via glucuronide conjugation and mitochondrial beta-oxidation. The relationship between dose and total valproate concentration is nonlinear; concentration does not increase proportionally with the dose, but increases to a lesser extent due to saturable plasma protein binding. The kinetics of unbound drug are linear.

Bioavailability: Depakote® ER: ~90% relative to I.V. dose and ~89% relative to delayed release formulation

Half-life elimination (increased in neonates and with liver disease): Children >2 months: 7-13 hours; Adults: 9-16 hours

Time to peak, serum: Depakote® tablet: ~4 hours; Depakote® ER: 4-17 hours; Stavzor™: 2 hours

Excretion: Urine (30% to 50% as glucuronide conjugate, 3% as unchanged drug)

- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsExtended release tablets have 10% to 20% less fluctuation in serum concentration than delayed release tablets. Extended release tablets are not bioequivalent to delayed release tablets.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Periodontal abscess and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentBoth valproic acid and lithium are considered first-line agents for the management of bipolar disorder. They are useful in patients with mixed and rapid-cycling bipolar disorder. Thrombocytopenia is dose dependent and may be more common in children (Koenig, 2008). Asymptomatic elevations of hepatic transaminases are also dose related and not necessarily associated with hepatic dysfunction. Severe hepatic dysfunction is a rare idiosyncratic reaction; it is not dose related. The majority of cases occur within the first 3 months. The cause is unknown but risk factors include young age (<2 years of age), multiple anticonvulsants, and the presence of a neurologic disease in addition to epilepsy. No hepatic fatalities have been reported in patients >10 years of age who received valproic acid monotherapy.

Valproic acid is one of only a few medications that displays saturation-dependent protein binding pharmacokinetics. Therefore, when large doses are taken, the protein binding sites become saturated. This leads to an increase in unbound drug, which in turn leads to an increase in total clearance with resulting steady-state concentrations less than what might be expected. The response threshold for bipolar disorder appears to be 50 mcg/mL. Serum concentration of the extended release dosage form taken 12 hours after the last dose will result in a 25% increase over the delayed release dosage form. Interpret the levels accordingly.

Use in dementia-related aggression: Valproic acid derivatives have been investigated for over 10 years in the setting of behavioral disturbances in dementia patients. Although a number of earlier investigations suggested that valproate was effective in reducing the severity of symptoms such as aggression and agitation, these studies were commonly limited by small numbers of patients, open-label design, and lack of statistical evaluation (see Pratt and Davis review). More recently, three randomized, controlled trials were reviewed by Sink et al. These studies evaluated the use of both long- and short-acting valproate formulations in a total of 270 nursing home patients presenting with dementia of the Alzheimer’s or vascular type. Although each study used a different rating scale for the assessment of neuropsychiatric symptoms, in none of the studies was the primary outcome variable significantly different ($p<0.05$) between valproate treatment and placebo.

In addition, a double-blind, randomized trial conducted by the Alzheimer’s Disease Cooperative Study group evaluated the use of divalproex in nursing home patients exhibiting dementia-associated agitation. Patients were randomized to receive divalproex (n=75) or placebo (n=78) for 6 weeks duration. The primary outcome variable was the Brief Psychiatry Rating Scale Agitation factor, with a secondary measure of the Clinical Global Impression of Change. Patients received an average dose of divalproex of 800 mg/day with approximately 88% compliance. There were no differences between treatment groups with respect to safety or tolerability. The results also showed no significant differences between groups in any of the outcome measures.

Taken together, data generated from several randomized, blinded studies do not support the use of valproic acid for the treatment of dementia-related aggression or agitation. Interestingly, there are experimental data both *in vitro* and *in vivo* which suggest a possible role for valproate in slowing the neuronal deterioration process resulting from Alzheimer’s pathology. Thus, there are studies ongoing to investigate the potential role that valproic acid may play in slowing disease progression and/or preserving cognitive function.

Anesthesia and Critical Care Concerns/Other ConsiderationsValproic acid may be used in pharmacologic treatment of refractory status epilepticus (Limdi, 2005; Meierkord, 2006). Intravenous infusions are generally well tolerated (Limdi, 2006; Limdi, 2007).

Index Terms2-Propylpentanoic Acid; 2-Propylvaleric Acid; Dipropylacetic Acid; Divalproex Sodium; DPA; Valproate Semisodium; Valproate Sodium; Valproic Acid

Valrubicin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Valstar® may be confused with valsartan

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(val ROO bi sin)

U.S. Brand NamesValstar® [DSC]

Canadian Brand NamesValstar®; Valtaxin®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline

Use: Labeled IndicationsIntravesical therapy of BCG-refractory carcinoma *in situ* of the urinary bladder

Dosing: Adults**Urinary carcinoma *in situ*:** Intravesical: 800 mg once weekly for 6 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: I.V.Intravesicular bladder lavage, usually in 75 mL of 0.9% sodium chloride injection. Retain in the bladder for 2 hours, then void. Due to the Cremophor® EL diluent, valrubicin should be administered through non-PVC tubing.

StorageStore unopened vials under refrigeration at 2°C to 8°C (36°F to 48°F). Stable for 12 hours when diluted in 0.9% sodium chloride.

ReconstitutionAllow vial to warm to room temperature without heating. Dilute 800 mg (20 mL) with 55 mL NS.

ContraindicationsHypersensitivity to anthracyclines, Cremophor® EL, or any component of the formulation; concurrent urinary tract infection or small bladder capacity (unable to tolerate a 75 mL instillation)

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cremophor® EL hypersensitivity: Should be used cautiously (if at all) in patients having a history of hypersensitivity reactions to other medications prepared with Cremophor® EL.

- Red-tinged urine: May occur in first 24 hours after instillation.

Disease-related concerns:

- Bladder perforation: Do not administer if mucosal integrity of bladder has been compromised or bladder perforation is present.

- Irritable bladder symptoms: Use with caution in patients with severe irritable bladder symptoms; irritable bladder symptoms may occur during instillation and retention.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. All patients of reproductive age should use an effective method of contraception during the treatment period.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether valrubicin is secreted in human milk. Because many immunoglobulins are secreted in milk, and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions

>10%: Genitourinary: Frequency (61%), dysuria (56%), urgency (57%), bladder spasm (31%), hematuria (29%), bladder pain (28%), urinary incontinence (22%), cystitis (15%), urinary tract infection (15%)

1% to 10%:

Cardiovascular: Chest pain (2%), vasodilation (2%), peripheral edema (1%)

Central nervous system: Headache (4%), malaise (4%), dizziness (3%), fever (2%)

Dermatologic: Rash (3%)

Endocrine & metabolic: Hyperglycemia (1%)

Gastrointestinal: Abdominal pain (5%), nausea (5%), diarrhea (3%), vomiting (2%), flatulence (1%)

Genitourinary: Nocturia (7%), burning symptoms (5%), urinary retention (4%), urethral pain (3%), pelvic pain (1%), hematuria (microscopic) (3%)

Hematologic: Anemia (2%)

Neuromuscular & skeletal: Weakness (4%), back pain (3%), myalgia (1%)

Respiratory: Pneumonia (1%)

<1%: Tenesmus, pruritus, taste disturbance, skin irritation, urine flow decreased, urethritis

Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCystoscopy, biopsy, and urine cytology every 3 months for recurrence or progression

Nursing: Physical Assessment/MonitoringThis medication is administered by a physician through a urinary bladder catheter, using aseptic technique. **Note:** Caution must be used to prevent exposure to this mediation. Assess patient response during and following instillation (genitourinary [frequency, urgency, incontinence or dysuria, bladder spasm or pain, hematuria, urinary tract infection], rash, nausea, vomiting, myalgia, hyperglycemia). Instruct patient on appropriate interventions to reduce side effects and adverse symptoms to report.

Monitoring: Lab TestsCystoscopy, biopsy, and urine cytology every 3 months for recurrence or progression

Patient EducationThis medication will be instilled into your bladder through a catheter to be retained for as long as possible. Your urine will be red tinged for the next 24 hours; report promptly if this continues for a longer period. May cause altered urination patterns (frequency, dysuria, or incontinence), some bladder pain, pain on urination, or pelvic pain; report if these persist. If you have diabetes, monitor glucose levels closely (may cause hyperglycemia). It is important that you maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, or taste disturbance (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain or palpitations; persistent dizziness; swelling of extremities; persistent nausea, vomiting, diarrhea, or abdominal pain; muscle weakness, pain, or tremors; unusual cough or respiratory difficulty; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication and for 1 month following therapy; consult prescriber for appropriate barrier contraceptives. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution [DSC]: 40 mg/mL (5 mL) [contains Cremophor® EL 50% (polyoxyethyleneglycol triricinoleate) and dehydrated alcohol 50%]

Generic AvailableNo

Mechanism of ActionBlocks function of DNA topoisomerase II; inhibits DNA synthesis, causes extensive chromosomal damage, and arrests cell development; unlike other anthracyclines, does not appear to intercalate DNA

Pharmacodynamics/Kinetics

Absorption: Well absorbed into bladder tissue, negligible systemic absorption. Trauma to mucosa may increase absorption, and perforation greatly increases absorption with significant systemic myelotoxicity.

Metabolism: Negligible after intravesical instillation and 2-hour retention

Excretion: Urine when expelled from urinary bladder (98.6% as intact drug; 0.4% as *N*-trifluoroacetyladriamycin)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms*N*-trifluoroacetyladriamycin-14-valerate; AD3L

Medication Safety Issues

Sound-alike/look-alike issues:

Diovan® may be confused with Darvon®, Dioval®, Zyban®

Pronunciation(val SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesDiovan HCT®

Canadian Brand NamesDiovan HCT®

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension

Dosing: Adults **Note:** Dose is individualized; combination product may be used as initial therapy or substituted for individual components in patients currently maintained on both agents separately or in patients not adequately controlled with monotherapy (using one of the agents or an agent within same antihypertensive class).

Hypertension: Oral:

Initial therapy: Valsartan 160 mg and hydrochlorothiazide 12.5 mg once daily; dose may be titrated after 1-2 weeks of therapy. Maximum recommended daily doses: Valsartan 320 mg; hydrochlorothiazide 25 mg.

Add-on/replacement therapy: Valsartan 80-160 mg and hydrochlorthiazide 12.5-25 mg once daily; dose may be titrated after 3-4 weeks of therapy. Maximum recommended daily dose: Valsartan 320 mg; hydrochlorothiazide 25 mg.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

CL_{cr} >30 mL/minute: No adjustment needed

Cl_{cr} ≤30 mL/minute: Use of combination not recommended. Contraindicated in patients with anuria.

Dosing: Hepatic ImpairmentUse with caution; initiate at lower dose and titrate slowly.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister with or without food.

Dietary ConsiderationsAvoid salt substitutes which contain potassium. May be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsHypersensitivity to valsartan, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; anuria

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use valsartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use valsartan with caution with pre-existing renal insufficiency, and severe renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs. Contraindicated in patients with anuria.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Pregnancy Risk FactorD
Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the 2nd and 3rd trimesters. Valsartan should be discontinued as soon as possible after pregnancy is detected. Hydrochlorothiazide crosses the placenta; adverse (but not teratogenic) effects have been reported in the fetus.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsExcretion of valsartan in breast milk is not known and use during nursing is not recommended; hydrochlorothiazide is excreted in breast milk
Adverse ReactionsPercentages reported with combination product; other reactions have been reported (see individual agents for additional information)

>10%: Renal: BUN increased (15%)

1% to 10%:

Cardiovascular: Hypotension (1%)

Central nervous system: Dizziness (6%; dose related)

Endocrine & metabolic: Hypokalemia (3%)

Renal: Creatinine increased (2%)

Respiratory: Nasopharyngitis (2%)

<1%, postmarketing, and/or case reports: Anaphylaxis, appetite increased, bronchospasm, constipation, dehydration, depression, dysuria, epistaxis, flushing, gout, hematocrit/hemoglobin decreased, hyperkalemia, libido decreased, orthostatic hypotension, photosensitivity, pruritus, syncope, transaminases increased

Rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists.

Frequency not defined, but occurred at >0.2% incidence (limited to important or life-threatening): Arthralgia, chest pain, cough, diarrhea, dyspepsia, dyspnea, fatigue, infection, myalgia, palpitation, paresthesia, peripheral edema, pollakiuria, postural dizziness, rash, tachycardia, vomiting, weakness, xerostomia

Metabolism/Transport EffectsValsartan: **Inhibits** CYP2C9 (weak)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Diovan HCT® 80 mg/12.5 mg: Valsartan 80 mg and hydrochlorothiazide 12.5 mg

Diovan HCT® 160 mg/12.5 mg: Valsartan 160 mg and hydrochlorothiazide 12.5 mg

Diovan HCT® 160 mg/25 mg: Valsartan 160 mg and hydrochlorothiazide 25 mg

Diovan HCT® 320 mg/12.5 mg: Valsartan 320 mg and hydrochlorothiazide 12.5 mg

160-12.5 mg (30): $77.51

160-25 mg (30): $91.79

320-12.5 mg (30): $95.87

320-25 mg (30): $117.29

Mechanism of ActionValsartan produces direct antagonism of the angiotensin II (AT2) receptors, unlike the ACE inhibitors. It displaces angiotensin II from the AT1 receptor and produces its blood pressure-lowering effects by antagonizing AT1-induced vasoconstriction, aldosterone release, catecholamine release, arginine vasopressin release, water intake, and hypertrophic responses. This action results in more efficient blockade of the cardiovascular effects of angiotensin II and fewer side effects than the ACE inhibitors.

Hydrochlorothiazide inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Hydrochlorothiazide
- Valsartan

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine; barbiturates and carbamazepine may increase the metabolism of valsartan; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: Currently, the use of angiotensin II receptor blockers (ARBs) should not supersede angiotensin converting enzyme inhibitors (ACEIs) in the treatment of congestive heart failure. One may be considered, however, when an ACEI cannot be tolerated. Because they are angiotensin II blockers rather than inhibitors of ACE, ARBs do not cause increases in bradykinin levels. *ELITE II* (Pitt, 2000) compared losartan (50 mg/day) with captopril (150 mg/day) in a heart failure population (mean EF 31%). There were 280 deaths in the losartan group and 250 in the captopril group. Mortality was insignificantly higher for losartan (17.7% vs 16% for captopril). The secondary endpoint (sudden cardiac death or resuscitated cardiac arrest) favored captopril, but the improvement did not achieve statistical significance. The discontinuation rate for adverse events was significantly lower for losartan. In the doses used, losartan appears to be less effective or as effective as captopril.

CHARM-Alternative is a prospective, randomized trial (Granger, 2003) in ACE inhibitor-intolerant patients with CHF. Patients were randomized to candesartan (target dose: 32 mg/day; mean dose at 6 months: 23 mg/day) or placebo. Baseline characteristics included NYHA Class II or III (97% of patients), and mean LVEF 30%. Therapy included beta-blocker (55%), diuretic (86%), spironolactone (24%), and digitalis (46%). During a 33-month follow up, the combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group mainly because of reduced hospitalization. Death due to cardiovascular disease was not significantly different. There were significantly more MIs (75) in the candesartan group than in the placebo group (48). Candesartan was discontinued because of hypotension, renal dysfunction, and hyperkalemia.

Congestive Heart Failure: Concomitant ACE-I Therapy: The *Val-HeFT study* (Cohn, 2001) randomized CHF patients maintained on standard therapy to valsartan (320 mg/day; mean dose 254 mg/day) or placebo. The primary outcome was mortality and a combined endpoint of morbidity and mortality (cardiac arrest, hospitalization for CHF, need for intravenous inotrope or vasodilator). Patients (5010 in number) with predominately NYHA class II or III heart failure (85% on diuretic; 67% on digoxin; 35% on beta-blocker; ~93% on ACEI; 5% on spironolactone) were randomized to valsartan or placebo. The mean duration of follow-up was 23 months. Overall mortality was similar in both groups. The incidence of combined endpoints was lower with valsartan than placebo (p=.009) primarily because of decreased heart failure hospitalizations in the valsartan group. In a post hoc analysis of the endpoints in subgroups defined by baseline treatments (ACEI or beta-blockers), valsartan had a positive effect on patients receiving neither or one of these drugs. A higher incidence of mortality was seen in patients receiving valsartan in combination with an ACEI and a beta-blocker.

CHARM-Added trial is a prospective, randomized trial (McMurray, 2003) evaluating the addition of candesartan therapy (target dose: 32 mg/day; mean dose at 6 months: 24 mg/day) to CHF patients maintained on an ACEI. Baseline characteristics: NYHA class II (24%), class III (73%), and mean LVEF 28%. Baseline therapy was similar to CHARM-Alternative except all patients were maintained on an ACEI and ~55% were on a beta-blocker. The median duration of follow-up was 41 months. The combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group.

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Myocardial Infarction: The 2004 ACC/AHA STEMI guidelines suggest an angiotensin receptor blocker should be administered to STEMI patients who are intolerant of ACE inhibitors and who have either clinical or radiological signs of heart failure or LVEF <0.4. The *OPTIMAAL trial* evaluated whether losartan (50 mg/day) would be superior or noninferior to captopril (150 mg/day) in post-MI patients. They were randomized to one of two treatments and followed up for 2.7 years. There was no difference between the two treatment groups (499 deaths in losartan group; 447 deaths in the captopril-treated group). The VALIANT trial compared the effects of valsartan, captopril, and the combination in patients who had suffered a recent MI (0.5 to 10 days prior) complicated by left ventricular systolic dysfunction (Pfeffer, 2003). The primary endpoint was mortality from any cause. Mortality in the valsartan group and the valsartan-captopril group was similar to the captopril group alone. Valsartan was found to be noninferior to captopril in this patient population. Combining valsartan with captopril increased the rate of adverse events without improving survival. Hypotension and renal dysfunction were more common in the valsartan group. Cough, rash, and taste disturbances were more common in the captopril group.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Index TermsHydrochlorothiazide and Valsartan

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Valsartan may be confused with losartan, Valstar™

Diovan® may be confused with Darvon®, Dioval®, Zyban®

Pronunciation(val SAR tan)

U.S. Brand NamesDiovan®

Canadian Brand NamesDiovan®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsAlone or in combination with other antihypertensive agents in the treatment of essential hypertension; reduction of cardiovascular mortality in patients with left ventricular dysfunction postmyocardial infarction; treatment of heart failure (NYHA Class II-IV)

Dosing: Adults

Hypertension: Initial: 80 mg or 160 mg once daily (in patients who are not volume depleted); dose may be increased to achieve desired effect; maximum recommended dose: 320 mg/day

Heart failure: Initial: 40 mg twice daily; titrate dose to 80-160 mg twice daily, as tolerated; maximum daily dose: 320 mg

Left ventricular dysfunction after MI: Initial: 20 mg twice daily; titrate dose to target of 160 mg twice daily as tolerated; may initiate ≥12 hours following MI

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Hypertension:** Oral: Children 6-16 years: Initial: 1.3 mg/kg once daily (maximum: 40 mg/day); dose may be increased to achieve desired effect; doses >2.7 mg/kg (maximum: 160 mg) have not been studied.

Dosing: Renal Impairment

Children: Use is not recommended if Cl_{cr} <30 mL/minute.

Adults: No dosage adjustment necessary if Cl_{cr} >10 mL/minute.

Dialysis: Not significantly removed.

Dosing: Hepatic ImpairmentIn mild-to-moderate liver disease no adjustment is needed. Use caution in patients with liver disease. Patients with mild to moderate chronic disease have twice the exposure as healthy volunteers.

Administration: OralAdminister with or without food.

Dietary ConsiderationsAvoid salt substitutes which contain potassium. May be taken with or without food.

StorageStore at 25°C (77°F); excursions between 15°C to 30°C (59°F to 86°F) permitted. Protect from moisture.

Extemporaneously PreparedTo prepare valsartan suspension, add 80 mL of Ora-Plus® to an 8-ounce amber glass bottle containing eight (8) valsartan 80 mg tablets. Shake well ≥2 minutes. Allow the suspension to stand for a minimum of 1 hour then shake for 1 minute. Then add 80 mL of Ora-Sweet SF® to the bottle and shake for at least 10 seconds. Resulting 160 mL suspension will contain valsartan 4 mg/mL. Store for either up to 30 days at room temperature (below 30°C/86°F) or up to 75 days under refrigeration (2-8°C/35-46°F) in the glass bottle. Shake well before use.

Product information, December, 2007; Novartis Pharmaceuticals Corp.

Contraindications

U.S. labeling: There are no contraindications listed in manufacturer's labeling.

Canadian labeling: Hypersensitivity to valsartan or any component of the formulation

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use with caution with these agents; monitor potassium closely.

- Hypotension: During the initiation of therapy, hypotension may occur, particularly in patients with heart failure or post-MI patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Heart failure: Use caution when initiating in heart failure; may need to adjust dose, and/or concurrent diuretic therapy, because of valsartan-induced hypotension. Careful monitoring of BUN, serum creatinine, and potassium is necessary especially if preexisting renal disease exists.

- Hepatic impairment: Use caution in patients with significant hepatic impairment since clearance is significantly reduced.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use valsartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- Pediatrics: Canadian labeling: Use is not approved in patients <18 years of age.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsNo dosage adjustment is necessary when initiating angiotensin II receptor antagonists in the elderly. In clinical studies, no differences between younger adults and elderly were demonstrated. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorD

Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if valsartan is found in breast milk; the manufacturer recommends discontinuing the drug or discontinuing nursing based on the importance of the drug to the mother.

Adverse Reactions

>10%:

Central nervous system: Dizziness (heart failure trials 17%)

Renal: BUN increased >50% (heart failure trials 17%)

1% to 10%:

Cardiovascular: Hypotension (heart failure trials 7%; MI trial 1%), postural hypotension (heart failure trials 2%), syncope (up to >1%)

Central nervous system: Dizziness (hypertension trial 2% to 8%), fatigue (heart failure trials 3%; hypertension trial 2%), postural dizziness (heart failure trials 2%), headache (heart failure trials >1%), vertigo (up to >1%)

Endocrine & metabolic: Serum potassium increased by >20% (4% to 10%), hyperkalemia (heart failure trials 2%)

Gastrointestinal: Diarrhea (heart failure trials 5%), abdominal pain (2%), nausea (heart failure trials >1%), upper abdominal pain (heart failure trials >1%)

Hematologic: Neutropenia (2%)

Neuromuscular & skeletal: Arthralgia (heart failure trials 3%), back pain (up to 3%)

Ocular: Blurred vision (heart failure trials >1%)

Renal: Creatinine doubled (MI trial 4%), creatinine increased >50% (heart failure trials 4%), renal dysfunction (up to >1%)

Respiratory: Cough (1% to 3%)

Miscellaneous: Viral infection (3%)

All indications: <1%, postmarketing, and/or case reports: Allergic reactions, alopecia, anaphylaxis, anemia, angioedema, anorexia, anxiety, chest pain, constipation, dyspepsia, dyspnea, flatulence, hematocrit/hemoglobin decreased, hepatitis, impotence, insomnia, liver function tests increased, microcytic anemia, muscle cramps, myalgia, palpitation, paresthesia, photosensitivity, pruritus, rash, rhabdomyolysis, somnolence, taste disorder, thrombocytopenia, vomiting, weakness, xerostomia

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak)
Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Decreases rate and extent of absorption by 50% and 40%, respectively.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBaseline and periodic electrolyte panels, renal function, BP; in CHF, serum potassium during dose escalation and periodically thereafter
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions with other pharmacological agents and herbal products patient may be taking (eg, concurrent use of potassium supplements, ACE inhibitors, potassium-sparing diuretics may increase risk of hyperkalemia). Assess results of laboratory tests at baseline and periodically during therapy. Assess therapeutic effectiveness (reduced hypertension) and adverse response on a regular basis during therapy (eg, changes in renal function, dizziness, bradycardia, cough, headache, nausea, hypotension, hyperkalemia). Teach patient appropriate use according to drug form and purpose of therapy, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsBaseline and periodic electrolyte panels, renal and liver function, urinalysis; in CHF, serum potassium during dose escalation and periodically thereafter
Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially sleep remedies or antisleep products, cough or cold remedies, or weight-loss products). Take exactly as directed and do not discontinue without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); or diarrhea (boiled milk, buttermilk, or yogurt may help). Report changes in urinary pattern; swelling of extremities; unusual back ache; chest pain or palpitations; unrelenting headache; muscle weakness or pain; unusual cough; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Diovan®: 40 mg, 80 mg, 160 mg, 320 mg

Generic AvailableNo
ManufacturerNovartis Pharmaceuticals Corp
Pricing: U.S. (www.drugstore.com)

Tablets (Diovan)

40 mg (30): $59.15

80 mg (30): $73.43

160 mg (30): $74.45

320 mg (30): $113.21

Mechanism of ActionValsartan produces direct antagonism of the angiotensin II (AT2) receptors, unlike the ACE inhibitors. It displaces angiotensin II from the AT1 receptor and produces its blood pressure-lowering effects by antagonizing AT1-induced vasoconstriction, aldosterone release, catecholamine release, arginine vasopressin release, water intake, and hypertrophic responses. This action results in more efficient blockade of the cardiovascular effects of angiotensin II and fewer side effects than the ACE inhibitors.

Pharmacodynamics/Kinetics

Onset of antihypertensive effect: 2 weeks (maximal: 4 weeks)

Distribution: V_d: 17 L (adults)

Protein binding: 95%, primarily albumin

Metabolism: To inactive metabolite

Bioavailability: Tablet: 25% (range 10% to 35%); suspension: ~40% (~1.6 times more than tablet)

Half-life elimination: ~6 hours

Time to peak, serum: 2-4 hours

Excretion: Feces (83%) and urine (13%) as unchanged drug

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Pharmacotherapy PearlsValsartan may have an advantage over losartan due to minimal metabolism requirements and consequent use in mild-to-moderate hepatic impairment.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine; barbiturates and carbamazepine may increase the metabolism of valsartan

Cardiovascular Considerations

Congestive Heart Failure: Currently, the use of angiotensin II receptor blockers (ARBs) should not supersede angiotensin converting enzyme inhibitors (ACEIs) in the treatment of congestive heart failure. One may be considered, however, when an ACEI cannot be tolerated. Because they are angiotensin II blockers rather than inhibitors of ACE, ARBs do not cause increases in bradykinin levels. *ELITE II* (Pitt, 2000) compared losartan (50 mg/day) with captopril (150 mg/day) in a heart failure population (mean EF 31%). There were 280 deaths in the losartan group and 250 in the captopril group. Mortality was insignificantly higher for losartan (17.7% vs 16% for captopril). The secondary endpoint (sudden cardiac death or resuscitated cardiac arrest) favored captopril, but the improvement did not achieve statistical significance. The discontinuation rate for adverse events was significantly lower for losartan. In the doses used, losartan appears to be less effective or as effective as captopril.

CHARM-Alternative is a prospective, randomized trial (Granger, 2003) in ACE inhibitor-intolerant patients with CHF. Patients were randomized to candesartan (target dose: 32 mg/day; mean dose at 6 months: 23 mg/day) or placebo. Baseline characteristics included NYHA Class II or III (97% of patients), and mean LVEF 30%. Therapy included beta-blocker (55%), diuretic (86%), spironolactone (24%), and digitalis (46%). During a 33-month follow up, the combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group mainly because of reduced hospitalization. Death due to cardiovascular disease was not significantly different. There were significantly more MIs (75) in the candesartan group than in the placebo group (48). Candesartan was discontinued because of hypotension, renal dysfunction, and hyperkalemia.

Congestive Heart Failure: Concomitant ACE-I Therapy: The *Val-HeFT study* (Cohn, 2001) randomized CHF patients maintained on standard therapy to valsartan (320 mg/day; mean dose 254 mg/day) or placebo. The primary outcome was mortality and a combined endpoint of morbidity and mortality (cardiac arrest, hospitalization for CHF, need for intravenous inotrope or vasodilator). Patients (5010 in number) with predominately NYHA class II or III heart failure (85% on diuretic; 67% on digoxin; 35% on beta-blocker; ~93% on ACEI; 5% on spironolactone) were randomized to valsartan or placebo. The mean duration of follow-up was 23 months. Overall mortality was similar in both groups. The incidence of combined endpoints was lower with valsartan than placebo (p=.009) primarily because of decreased heart failure hospitalizations in the valsartan group. In a post hoc analysis of the endpoints in subgroups defined by baseline treatments (ACEI or beta-blockers), valsartan had a positive effect on patients receiving neither or one of these drugs. A higher incidence of mortality was seen in patients receiving valsartan in combination with an ACEI and a beta-blocker.

CHARM-Added trial is a prospective, randomized trial (McMurray, 2003) evaluating the addition of candesartan therapy (target dose: 32 mg/day; mean dose at 6 months: 24 mg/day) to CHF patients maintained on an ACEI. Baseline characteristics: NYHA class II (24%), class III (73%), and mean LVEF 28%. Baseline therapy was similar to CHARM-Alternative except all patients were maintained on an ACEI and ~55% were on a beta-blocker. The median duration of follow-up was 41 months. The combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group.

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Myocardial Infarction: The 2004 ACC/AHA STEMI guidelines suggest an angiotensin receptor blocker should be administered to STEMI patients who are intolerant of ACE inhibitors and who have either clinical or radiological signs of heart failure or LVEF <0.4. The *OPTIMAAL trial* evaluated whether losartan (50 mg/day) would be superior or noninferior to captopril (150 mg/day) in post-MI patients. They were randomized to one of two treatments and followed up for 2.7 years. There was no difference between the two treatment groups (499 deaths in losartan group; 447 deaths in the captopril-treated group). The VALIANT trial compared the effects of valsartan, captopril, and the combination in patients who had suffered a recent MI (0.5 to 10 days prior) complicated by left ventricular systolic dysfunction (Pfeffer, 2003). The primary endpoint was mortality from any cause. Mortality in the valsartan group and the valsartan-captopril group was similar to the captopril group alone. Valsartan was found to be noninferior to captopril in this patient population. Combining valsartan with captopril increased the rate of adverse events without improving survival. Hypotension and renal dysfunction were more common in the valsartan group. Cough, rash, and taste disturbances were more common in the captopril group.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Medication Safety Issues

Sound-alike/look-alike issues:

I.V. vancomycin may be confused with Invanz®

Vancomycin may be confused with clindamycin, gentamicin, tobramycin, valacyclovir, vecuronium, Vibramycin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (intrathecal administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(van koe MYE sin)
U.S. Brand NamesVancocin®
Canadian Brand NamesVancocin®
Pharmacologic CategoryAntibiotic, Miscellaneous
Use: Labeled IndicationsTreatment of patients with infections caused by staphylococcal species and streptococcal species; used orally for staphylococcal enterocolitis or for antibiotic-associated pseudomembranous colitis produced by *C. difficile*
Use: Unlabeled/InvestigationalBacterial endophthalmitis
Dosing: Adults

Usual dosage range:

I.V.: 2-3 g/day (20-45 mg/kg/day) in divided doses every 6-12 hours; maximum 3 g/day; **Note:** Dose requires adjustment in renal impairment

Oral: 500-1000 mg/day in divided doses every 6 hours

Indication-specific dosing:

Catheter-related infections: Antibiotic lock technique: 2 mg/mL in SWFI/NS or D_5W; instill 3-5 mL into catheter port as a flush solution instead of heparin lock (**Note:** Do not mix with any other solutions.)

Colitis (*C. difficile*), enterocolitis*(S. aureus)*: Oral: 500-2000 mg/day in 3-4 divided doses for 7-10 days (usual dose: 125-250 mg every 6 hours)

Endophthalmitis (unlabeled use): Intravitreal: Usual dose: 1 mg/0.1 mL NS instilled into vitreum; may repeat administration if necessary in 3-4 days, usually in combination with ceftazidime or an aminoglycoside

Note: Some clinicians have recommended using a lower dose of 0.2 mg/0.1 mL, based on concerns for retinotoxicity.

Hospital-acquired pneumonia (HAP): I.V.: 15 mg/kg/dose every 12 hours (American Thoracic Society [ATS] 2005 guidelines)

Meningitis *(Pneumococcus* or*Staphylococcus)*:

I.V.: 30-45 mg/kg/day in divided doses every 8-12 hours **or** 500-750 mg every 6 hours (with third-generation cephalosporin for PCN-resistant *Streptococcus pneumoniae*); maximum dose: 2-3 g/day

Intrathecal: Up to 20 mg/day

Prophylaxis against infective endocarditis: I.V.:

Dental, oral, or upper respiratory tract surgery: 1 g 1 hour before surgery. **Note:** AHA guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur.

GI/GU procedure: 1 g plus 1.5 mg/kg gentamicin 1 hour prior to surgery. **Note:** As of April 2007, routine prophylaxis no longer recommended by the AHA.

Susceptible gram-positive infections: I.V.: 15-20 mg/kg/dose (usual: 750-1500 mg) every 12 hours

Dosing: ElderlyRefer to adult dosing. Elderly patients may require greater dosage reduction than expected. Best to individualize therapy; dose (mg/kg/24 hours) = (0.227 x Cl_{cr}) + 5.67.
Dosing: Pediatric

Usual dosage range: Infants >1 month and Children: I.V.: 10-15 mg/kg every 6 hours

Indication-specific dosing: Infants >1 month and Children:

Colitis (*C. difficile*), enterocolitis*(S. aureus)*: Oral: 40 mg/kg/day in 3-4 divided doses added to fluids for 7-10 days (maximum: 2000 mg/day)

Meningitis/CNS infection:

I.V.: 15 mg/kg every 6 hours

Intrathecal: 5-20 mg/day

Prophylaxis against infective endocarditis: I.V.:

Dental, oral, or upper respiratory tract surgery: 20 mg/kg 1 hour prior to the procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur.

GI/GU procedure: 20 mg/kg plus gentamicin 2 mg/kg 1 hour prior to surgery. **Note:** As of April 2007, routine prophylaxis no longer recommended by the AHA.

Susceptible gram-positive infections: I.V.: 10 mg/kg every 6 hours

Dosing: Renal ImpairmentVancomycin levels should be monitored in patients with any renal impairment:

Cl_{cr} >50 mL/minute: Start with 15-20 mg/kg/dose (usual: 750-1500 mg) every 12 hours

Cl_{cr} 20-49 mL/minute: Start with 15-20 mg/kg/dose (usual: 750-1500 mg) every 24 hours

Cl_{cr} <20 mL/minute: Will need longer intervals; determine by serum concentration monitoring

Dialysis: Variable, depending on method; poorly dialyzable by conventional hemodialysis (0% to 5%). Use of high-flux membranes and continuous renal replacement therapy (CRRT) increases vancomycin clearance, and generally requires replacement dosing.

Hemodialysis (HD): Following loading dose of 15-20 mg/kg, give 500 mg to 1 g after each dialysis session, depending on factors such as HD membrane type and flow rate; monitor levels closely.

Continuous ambulatory peritoneal dialysis (CAPD):

Administration via CAPD fluid: 15-30 mg/L (15-30 mcg/mL) of CAPD fluid

Systemic: 1 g loading dose, followed by 500 mg to 1 g every 48-72 hours with close monitoring of levels

Continuous renal replacement therapy (CRRT): Removal of vancomycin is highly dependent on the method of replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of levels in relation to target trough. The following are general recommendations only (based on Trotman, et al, 2005), and require consideration of the aforementioned parameters.

CVVH: Following loading dose of 15-20 mg/kg, give 1 g every 48 hours

CVVHD or CVVHDF: Following loading dose of 15-20 mg/kg, give 1 g every 24 hours

Trotman RL, Williamson JC, Shoemaker DM, et al, "Antibiotic Dosing in Critically Ill Adult Patients Receiving Continuous Renal Replacement Therapy," *Clin Infect Dis*, 2005, 41:1159-66.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Do not administer I.M.

Administration: I.V.Administer vancomycin by I.V. intermittent infusion over at least 60 minutes (recommended rate of ≥30 minutes for every 500 mg administered) at a final concentration not to exceed 5 mg/mL.

Red man syndrome may occur if the infusion is too rapid. It is not an allergic reaction, but may be characterized by hypotension and/or a maculopapular rash appearing on the face, neck, trunk, and/or upper extremities. If this should occur, slow the infusion rate to over $1^{1}/_{2}$ to 2 hours and increase the dilution volume. Reactions are often treated with antihistamines and steroids.

Extravasation treatment: Monitor I.V. site closely; extravasation will cause serious injury with possible necrosis and tissue sloughing. Rotate infusion site frequently.

Administration: I.V. Detail
pH: 3.9 (in distilled water or sodium chloride 0.9%); 2.5-4.5 (5% solution in water)

Administration: OralMay be administered with food. If patient cannot swallow capsules, the powder for injection may be reconstituted and diluted for oral administration.

Administration: OtherVancomycin is available as a powder for injection and may be diluted to 1-5 mg/mL concentration in preservative-free 0.9% sodium chloride for administration into the CSF
May be administered by intravitreal injection (unlabeled use).

Dietary ConsiderationsMay be taken with food.

StorageReconstituted 500 mg and 1 g vials are stable for at either room temperature or under refrigeration for 14 days. **Note:** Vials contain no bacteriostatic agent. Solutions diluted for administration in either D_5W or NS are stable under refrigeration for 14 days or at room temperature for 7 days.

ReconstitutionReconstitute vials with 20 mL of SWFI for each 1 g of vancomycin (10 mL/500 mg vial; 20 mL/1 g vial; 100 mL/5 g vial; 200 mL/10 g vial). The reconstituted solution must be further diluted with at least 100 mL of a compatible diluent per 500 mg of vancomycin prior to parenteral administration.

Intrathecal: Vancomycin is available as a powder for injection and may be diluted to 1-5 mg/mL concentration in preservative free 0.9% sodium chloride for administration into the CSF.

CompatibilityStable in dextran 6% in NS, D_5NS, D_5W, $D_{10}W$, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solutions, TPN.

Y-site administration: Compatible: Acyclovir, aldesleukin, allopurinol, amifostine, amiodarone, amsacrine, anidulafungin, atracurium, cisatracurium, clarithromycin, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, doxapram, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, fenoldopam, filgrastim, fluconazole, fludarabine, gallium nitrate, gemcitabine, granisetron, hetastarch, hydromorphone, insulin (regular), labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, meropenem, midazolam, milrinone, morphine, nicardipine, ondansetron, paclitaxel, pancuronium, pemetrexed, perphenazine, remifentanil, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tolazoline, vecuronium, vinorelbine, zidovudine. **Incompatible:** Albumin, amphotericin B cholesteryl sulfate complex, bivalirudin, drotrecogin alfa, idarubicin, omeprazole. **Variable (consult detailed reference):** Ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, foscarnet, heparin, methotrexate, nafcillin, piperacillin, piperacillin/tazobactam, propofol, sargramostim, ticarcillin/clavulanate, TPN, warfarin.

Compatibility in syringe: Compatible: Caffeine citrate, pantoprazole. **Incompatible:** Dimenhydrinate, heparin.

Compatibility when admixed: Compatible: Amikacin, atracurium, calcium gluconate, cefepime, cimetidine, corticotropin, dimenhydrinate, famotidine, fusidate sodium, hydrocortisone sodium succinate, meropenem, ofloxacin, potassium chloride, ranitidine, verapamil, vitamin B complex with C. **Incompatible:** Amobarbital, chloramphenicol, chlorothiazide, dexamethasone sodium phosphate, penicillin G potassium, pentobarbital, phenobarbital. **Variable (consult detailed reference):** Aminophylline, aztreonam, heparin, sodium bicarbonate.

ContraindicationsHypersensitivity to vancomycin or any component of the formulation; avoid in patients with previous severe hearing loss

Allergy Considerations

- Glycopeptide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Nephrotoxicity: May cause nephrotoxicity; usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age, and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.

- Neurotoxicity: May cause neurotoxicity; usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age, and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.

- Neutropenia: Prolonged therapy (>1 week) or total doses exceeding 25 g may increase the risk of neutropenia; prompt reversal of neutropenia is expected after discontinuation of therapy.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment or those receiving other nephrotoxic or ototoxic drugs; dosage modification required (especially elderly).

Other warnings/precautions:

- Appropriate use: Oral vancomycin is only indicated for the treatment of pseudomembranous colitis due to *C. difficile* and enterocolitis due to *S. aureus* and is not effective for systemic infections; parenteral vancomycin is not effective for the treatment of colitis due to *C. difficile* and enterocolitis due to *S. aureus*.

- Infusion reactions: Rapid I.V. administration may result in hypotension, flushing, erythema, urticaria, and/or pruritus; rate of infusion should be ≥60 minutes.

Geriatric ConsiderationsAs a result of age-related changes in renal function and volume of distribution, accumulation and toxicity are a risk in the elderly. Careful monitoring and dosing adjustment is necessary.

Pregnancy Risk FactorB (oral); C (injection)

Pregnancy ConsiderationsAdverse effects have not been observed in animal studies and there are no controlled studies in pregnant women; however, oral vancomycin is not systemically absorbed. Therefore, I.V. vancomycin has been classified pregnancy category C and oral vancomycin has been classified pregnancy category B. Vancomycin crosses the placenta. *In vivo* studies and human case reports have documented placental transfer of vancomycin in the second and third trimesters of pregnancy resulting in therapeutic fetal concentrations. Vancomycin has not caused adverse fetal effects, including hearing loss or nephrotoxicity, when administered during pregnancy. A case report has been published of a vancomycin dose rapidly administered over 3 minutes leading to maternal hypotension and fetal bradycardia.

The pharmacokinetics of vancomycin may be altered during pregnancy and pregnant patients may need a higher dose of vancomycin. Maternal half-life is unchanged, but the volume of distribution and the total plasma clearance are increased. Individualization of therapy through serum concentration monitoring may be warranted. Vancomycin is recommended for use in pregnant women for prevention of early-onset group B streptococcal (GBS) disease in newborns.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSmall amounts of vancomycin are excreted in human milk and use during breast-feeding is not recommended by the manufacturer. If given orally to the mother, the minimal systemic absorption of the dose would limit the amount available to pass into the milk. If given intravenously, the small amount that distributes to the milk would not be expected to cause systemic toxicity due to the lack of GI absorption. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Vancomycin in Pregnancy & Lactation

Adverse Reactions

Oral:

>10%: Gastrointestinal: Bitter taste, nausea, vomiting

1% to 10%:

Central nervous system: Chills, drug fever

Hematologic: Eosinophilia

<1%: Interstitial nephritis, ototoxicity, renal failure, thrombocytopenia, vasculitis

Parenteral:

>10%:

Cardiovascular: Hypotension accompanied by flushing

Dermatologic: Erythematous rash on face and upper body (red neck or red man syndrome - infusion rate related)

1% to 10%:

Central nervous system: Chills, drug fever

Dermatologic: Rash

Hematologic: Eosinophilia, reversible neutropenia

<1%: Ototoxicity (especially with large doses), thrombocytopenia, renal failure (especially with renal dysfunction or pre-existing hearing loss), Stevens-Johnson syndrome, vasculitis

Oncology: VesicantNo

Drug Interactions

Aminoglycosides: Vancomycin may enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Vancomycin may enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Gallium Nitrate: Vancomycin may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Vancomycin may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Monitoring ParametersPeriodic renal function tests, urinalysis, serum vancomycin concentrations, WBC, audiogram

Reference Range

Timing of serum samples: Draw peak 1 hour after 1-hour infusion has completed; draw trough just before next dose

Therapeutic levels: Peak: 25-40 mcg/mL; Trough: 5-12 mcg/mL

Toxic: >80 mcg/mL (SI: >54 µmol/L)

The ATS guidelines recommend trough levels of 15-20 mcg/mL for hospital-acquired pneumonia. The Infectious Disease Society of America (ISDA) meningitis guidelines recommend trough levels of 15-20 mcg/mL.

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient’s allergy history prior to first dose. Use caution with renal impairment or previous hearing loss. Assess potential for interactions with other pharmacological agents patient may be taking (eg, concurrent use with anything that is ototoxic or nephrotoxic increases risk of toxicity). See Administration for infusion specifics (premedication with antihistamines may prevent or minimize "red man" reaction). Infusion site must be monitored closely to prevent extravasation. Assess results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse response (eg, hypotension, rash, neutropenia, nausea, vomiting, auditory changes) on a regular basis during therapy. Teach patient appropriate use (oral), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to first dose. Periodic renal function, urinalysis, serum vancomycin concentrations, WBC, audiogram with prolonged use. Obtain drug levels after the third dose unless otherwise directed. Peaks are drawn 1 hour after the completion of a 1- to 2-hour infusion. Troughs are obtained just before the next dose.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. If administered by infusion, report immediately any chills; pain, swelling, or redness at infusion site; or respiratory difficulty. Oral medication should be taken as directed. Take all of prescribed medication even if feeling better. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea, vomiting, or GI upset (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report rash or hives; chills or fever; persistent GI disturbances; opportunistic infection (sore throat, chills, fever, burning, itching on urination, vaginal discharge, white plaques in mouth); respiratory difficulty; any change in urine output; chest pain or palpitations; changes in hearing or feeling of fullness in ears; other persistent adverse effects or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Vancocin®): 125 mg, 250 mg

Infusion [premixed in iso-osmotic dextrose] (Vancocin®): 500 mg (100 mL); 1 g (200 mL)

Injection, powder for reconstitution: 500 mg, 1 g, 5 g, 10 g

Generic AvailableYes: Injection

Pricing: U.S. (www.drugstore.com)

Capsules (Vancocin HCl)

125 mg (20): $221.72

250 mg (20): $638.61

Mechanism of ActionInhibits bacterial cell wall synthesis by blocking glycopeptide polymerization through binding tightly to D-alanyl-D-alanine portion of cell wall precursor

Pharmacodynamics/Kinetics

Absorption: Oral: Poor; I.M.: Erratic; Intraperitoneal: ~38%

Distribution: Widely in body tissue and fluids, except for CSF

Relative diffusion from blood into CSF: Good only with inflammation (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: Nil; Inflamed meninges: 20% to 30%

Protein binding: 10% to 50%

Half-life elimination: Biphasic: Terminal:

Newborns: 6-10 hours

Infants and Children 3 months to 4 years: 4 hours

Children >3 years: 2.2-3 hours

Adults: 5-11 hours; significantly prolonged with renal impairment

End-stage renal disease: 200-250 hours

Time to peak, serum: I.V.: 45-65 minutes

Excretion: I.V.: Urine (80% to 90% as unchanged drug); Oral: Primarily feces

- Recommendations for Preventing the Spread of Vancomycin Resistance

Pharmacotherapy PearlsBecause of its long half-life, vancomycin should be dosed on an every 12-hour basis. Monitoring of peak and trough serum levels is advisable. “Red man syndrome”, characterized by skin rash and hypotension, is not an allergic reaction but rather is associated with too rapid infusion of the drug. To alleviate or prevent the reaction, infuse vancomycin at a rate of ≥30 minutes for each 500 mg of drug being administered (eg, 1 g over ≥60 minutes); 1.5 g over ≥90 minutes.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bitter taste. “Red man syndrome”, characterized by skin rash and hypotension, is not an allergic reaction but rather is associated with too rapid infusion of the drug. To alleviate or prevent the reaction, infuse vancomycin at a rate of ≥30 minutes for each 500 mg of drug being administered (eg, 1 g over ≥60 minutes); 1.5 g over ≥90 minutes.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: "Red man syndrome" (characterized by skin rash and hypotension) is not an allergic reaction, but rather is associated with infusion administered too rapidly. To alleviate or prevent the reaction, infuse vancomycin at a rate of ≥30 minutes for each 500 mg of drug being administered (eg, 1 g over ≥60 minutes; 1.5 g over ≥90 minutes). CVVHD clears vancomycin from the circulation while conventional hemodialysis does not.

Limitations which may contribute to clinical failure include poor lung penetration, slow bactericidal activity against *S. aureus*, limited CNS penetration, high-level resistance to enterococci and *S. aureus*, and limited activity against bacteria that coat prosthetic devices.

Index TermsVancomycin Hydrochloride

Vardenafil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Vardenafil may be confused with sildenafil, tadalafil

Levitra® may be confused with Kaletra®, Lexiva®

Pronunciation(var DEN a fil)

U.S. Brand NamesLevitra®

Canadian Brand NamesLevitra®

Pharmacologic CategoryPhosphodiesterase-5 Enzyme Inhibitor

Use: Labeled IndicationsTreatment of erectile dysfunction (ED)

Dosing: Adults

Erectile dysfunction: Oral: 10 mg 60 minutes prior to sexual activity; dosing range: 5-20 mg; to be given as one single dose and not given more than once daily

Dosing adjustment with concomitant medications:

Alpha-blocker (dose should be stable at time of vardenafil initiation): Initial vardenafil dose: 5 mg/24 hours; if an alpha-blocker is added to vardenafil therapy, it should be initiated at the smallest possible dose, and titrated carefully.

Atazanavir: Maximum vardenafil dose: 2.5 mg/24 hours

Clarithromycin: Maximum vardenafil dose: 2.5 mg/24 hours

Erythromycin: Maximum vardenafil dose: 5 mg/24 hours

Indinavir: Maximum vardenafil dose: 2.5 mg/24 hours

Itraconazole:

200 mg/day: Maximum vardenafil dose: 5 mg/24 hours

400 mg/day: Maximum vardenafil dose: 2.5 mg/24 hours

Ketoconazole:

200 mg/day: Maximum vardenafil dose: 5 mg/24 hours

400 mg/day: Maximum vardenafil dose: 2.5 mg/24 hours

Ritonavir: Maximum vardenafil dose: 2.5 mg/72 hours

Saquinavir: Maximum vardenafil dose: 2.5 mg/24 hours

Dosing: ElderlyErectile dysfunction: Elderly ≥65 years: Oral: Initial: 5 mg 60 minutes prior to sexual activity; to be given as one single dose and not given more than once daily.

Dosing: Renal ImpairmentDose adjustment not needed for mild, moderate, or severe impairment; use has not been studied in patients on renal dialysis.

Dosing: Hepatic Impairment

Child-Pugh class A: No adjustment required

Child-Pugh class B: Initial: 5 mg 60 minutes prior to sexual activity (maximum dose: 10 mg); to be given as one single dose and not given more than once daily

Child-Pugh class C: Has not been studied; use is not recommended by the manufacturer

Administration: OralMay be administered with or without food, 60 minutes prior to sexual activity.

Dietary ConsiderationsMay take with or without food.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 25°C (59°F to 86°F).

ContraindicationsHypersensitivity to vardenafil or any component of the formulation; concurrent (regular or intermittent) use of organic nitrates in any form (eg, nitroglycerin, isosorbide dinitrate)

Warnings/Precautions

Concerns related to adverse effects:

- Color discrimination: May cause dose-related impairment of color discrimination. Use caution in patients with retinitis pigmentosa; a minority have genetic disorders of retinal phosphodiesterases (no safety information available).

- Hearing loss: Sudden decrease or loss of hearing has been reported rarely; hearing changes may be accompanied by tinnitus and dizziness. A direct relationship between therapy and hearing loss has not been determined.

- Hypotension: Decreases in blood pressure may occur due to vasodilator effects; use with caution in patients with left ventricular outflow obstruction (aortic stenosis or hypertrophic obstructive cardiomyopathy); may be more sensitive to hypotensive actions. Concurrent use with alpha-adrenergic antagonist therapy may cause symptomatic hypotension; patients should be hemodynamically stable prior to initiating therapy at the lowest possible dose.

- Priapism: Has been reported (rarely) with use. Instruct patients to seek immediate medical attention if erection persists >4 hours. Use with caution in patients who have conditions which may predispose them to priapism (sickle cell anemia, multiple myeloma, leukemia).

- Vision loss: Vision loss may occur rarely and be a sign of nonarteritic anterior ischemic optic neuropathy (NAION). Risk may be increased with history of vision loss. Other risk factors for NAION include low cup-to-disc ratio (“crowded disc”), coronary artery disease, diabetes, hypertension, hyperlipidemia, smoking, and >50 years of age. Safety and efficacy were not studied in patients with known degenerative retinal disorders (eg, retinitis pigmentosa); use is not recommended.

Disease-related concerns:

- Anatomical penis deformation: Use with caution in patients with anatomical deformation of the penis (angulation, cavernosal fibrosis, or Peyronie's disease).

- Bleeding disorders: Use with caution in patients with bleeding disorders; safety and efficacy have not been established.

- Cardiovascular disease: Use is not recommended in patients with hypotension (<90/50 mm Hg); uncontrolled hypertension (>170/100 mm Hg); unstable angina or angina during intercourse; life-threatening arrhythmias, stroke or MI within the last 6 months; cardiac failure or coronary artery disease causing unstable angina. Safety and efficacy have not been studied in these patients. Use caution in patients with left ventricular outflow obstruction (eg, aortic stenosis). There is a degree of cardiac risk associated with sexual activity; therefore, physicians may wish to consider the cardiovascular status of their patients prior to initiating any treatment for erectile dysfunction.

- Congenital QT prolongation: Not recommended for use in patients with congenital QT prolongation.

- Hepatic impairment: Use with caution in patients with hepatic impairment (Child-Pugh class B); dosage adjustment is needed. Safety and efficacy have not been studied in patients with severe hepatic impairment (Child-Pugh class C), therefore, use in these patients is not recommended.

- Peptic ulcer disease: Use with caution in patients with active peptic ulcer disease; safety and efficacy have not been established.

- Renal impairment: Safety and efficacy have not been studied in patients with end-stage renal disease requiring dialysis, therefore, use in these patients is not recommended.

Concurrent drug therapy issues:

- Alpha-blockers: Use with caution in patients taking alpha-blockers; may cause hypotension. Safety of this combination may be affected by other antihypertensives and intravascular volume depletion. Patients should be hemodynamically stable prior to initiating therapy. Initiate vardenafil at the lowest recommended dose.

- Drugs with QT prolongation potential: Use with caution in patients taking medications known to prolong the QT interval. Avoid use in patients taking Class Ia or III antiarrhythmics.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (see Drug Interactions); dosage reductions may be necessary; consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Nitrates: Concomitant use with all forms of nitrates is contraindicated. If nitrate administration is medically necessary, it is not known when nitrates can be safely administered following the use of vardenafil; the ACC/AHA 2007 guidelines support administration of nitrates only if 24 hours have elapsed.

- Other treatments for erectile dysfunction: Safety and efficacy with other treatments for erectile dysfunction have not been established; concurrent use is not recommended.

Special populations:

- Elderly: Use with caution in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Potential underlying causes of erectile dysfunction should be evaluated prior to treatment.

Geriatric ConsiderationsIn adults ≥65 years of age, vardenafil plasma concentrations were higher than younger males (mean C_{max} was 34% higher), therefore, initial dose should be lower than the usual adult dose. Since the elderly often have concomitant diseases, many of which may be contraindicated with the use of vardenafil, a thorough knowledge of disease and medications must be accessed.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, vardenafil is not indicated for use in women. No effects on sperm motility or morphology were observed in healthy males.

LactationExcretion in breast milk unknown/not indicated for use in women.

Adverse Reactions

>10%:

Cardiovascular: Flushing (11%)

Central nervous system: Headache (15%)

2% to 10%:

Central nervous system: Dizziness (2%)

Gastrointestinal: Dyspepsia (4%), nausea (2%)

Neuromuscular & skeletal: CPK increased (2%)

Respiratory: Rhinitis (9%), sinusitis (3%)

Miscellaneous: Flu-like syndrome (3%)

<2%, postmarketing, and/or case reports: Abdominal pain, abnormal ejaculation, amnesia (transient global), anaphylactic reaction, angina, arthralgia, back pain, blurred vision, chest pain, chromatopsia, color vision changes, conjunctivitis, diaphoresis, diarrhea, dim vision, dysphagia, dyspnea, epistaxis, esophagitis, eye pain, facial edema, gastritis, gastroesophageal reflux, GGT increased, glaucoma, hearing decreased, hearing loss, hypertension, hypertonia, hypoesthesia, hypotension, insomnia, laryngeal edema, liver function tests abnormal, MI, myalgia, myocardial ischemia, neck pain, nonarteritic ischemic optic neuropathy (NAION), pain, palpitation, paresthesia, pharyngitis, photophobia, photosensitivity reaction, postural hypotension, priapism, pruritus, rash, retinal vein occlusion, seizure, somnolence, syncope, tachycardia, tinnitus, vertigo, vision abnormal, vision loss (temporary or permanent), visual acuity reduced, visual field defects, vomiting, watery eyes, weakness, xerostomia

Metabolism/Transport Effects**Substrate** of CYP2C (minor), 3A5 (minor), 3A4 (major)

Drug Interactions

Alpha1-Blockers: Phosphodiesterase 5 Inhibitors may enhance the hypotensive effect of Alpha1-Blockers. **Exceptions:** Dapiprazole [Off Market]. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of Phosphodiesterase 5 Inhibitors. Management: No empiric dosage adjustments are recommended with concomitant therapy; however, dose of the phosphodiesterase inhibitor may need to be altered based on clinical response. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Phosphodiesterase 5 Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Sapropterin: May enhance the hypotensive effect of Phosphodiesterase 5 Inhibitors. *Risk C: Monitor therapy*

Vasodilators (Organic Nitrates): Phosphodiesterase 5 Inhibitors may enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions Food: High-fat meals decrease maximum serum concentration 18% to 50%. Serum concentrations/toxicity may be increased with grapefruit juice; avoid concurrent use.

Monitoring ParametersMonitor for response and adverse reactions.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, and herbal products patient may be taking. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Use exactly as directed 60 minutes prior to sexual activity without regard to meals; avoid taking with high-fat meals or grapefruit juice. Do not combine with other approaches to treating erectile dysfunction without consulting prescriber. **Note:** This medication does not provide protection against sexually-transmitted diseases, including HIV. You may experience headache, flushing, or blurred vision (use caution when driving at night or in poorly lit environments until response is known). Report immediately chest pain; acute head pain; respiratory difficulty; change in vision (seeing a blue tinge to objects or having difficulty telling the difference between the colors blue and green); change in hearing or ringing in the ears; allergic response (chills, fever, respiratory difficulty, rash); genital swelling; erection lasting >4 hours; or other adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Levitra®: 2.5 mg, 5 mg, 10 mg, 20 mg

Generic AvailableNo

ManufacturerBayer Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Levitra)

5 mg (10): $135.99

10 mg (10): $137.99

20 mg (10): $136.99

Mechanism of ActionDoes not directly cause penile erections, but affects the response to sexual stimulation. The physiologic mechanism of erection of the penis involves release of nitric oxide (NO) in the corpus cavernosum during sexual stimulation. NO then activates the enzyme guanylate cyclase, which results in increased levels of cyclic guanosine monophosphate (cGMP), producing smooth muscle relaxation and inflow of blood to the corpus cavernosum. Vardenafil enhances the effect of NO by inhibiting phosphodiesterase type 5 (PDE-5), which is responsible for degradation of cGMP in the corpus cavernosum; when sexual stimulation causes local release of NO, inhibition of PDE-5 by vardenafil causes increased levels of cGMP in the corpus cavernosum, resulting in smooth muscle relaxation and inflow of blood to the corpus cavernosum; at recommended doses, it has no effect in the absence of sexual stimulation.

Pharmacodynamics/Kinetics

Onset of action: ~60 minutes

Absorption: Rapid

Distribution: V_d: 208 L

Protein binding: ~95% (parent drug and metabolite)

Metabolism: Hepatic via CYP3A4 (major), CYP2C and 3A5 (minor); forms metabolite (active)

Bioavailability: ~15%; Elderly (≥65 years): AUC increased by 52%; Hepatic impairment (moderate, Child-Pugh class B): AUC increased by 160%

Half-life elimination: Terminal: Vardenafil and metabolite: 4-5 hours

Time to peak, plasma: 0.5-2 hours

Excretion: Feces (91% to 95% as metabolites); urine (2% to 6%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause flu-like syndrome; consider this when evaluating for potential SSRI discontinuation syndrome; the symptoms are similar. Serum concentration of vardenafil may be increased with concurrent use of fluoxetine, fluvoxamine, and nefazodone; monitor.

Cardiovascular ConsiderationsVardenafil, when used in conjunction with nitrates, may be associated with severe hypotension, myocardial infarction, and possibly death. While there are no clear significant increased cardiovascular events with PDE-5 inhibitors alone, these drugs should be absolutely avoided in conjunction with nitrates and may also induce significant and possibly fatal hypotension in patients with heart failure. Hemodynamic effects of PDE-5 inhibitors alone include a very slight drop in blood pressure without significant changes in heart rate. The most recent guidelines on the use of sildenafil (prototype PDE-5 inhibitor) in patients with cardiovascular disease are outlined in detail (Cheitlin, 1999). The general clinical recommendations are as follows.

Use of PDE-5 inhibitors is contraindicated in patients currently taking nitrate preparations.

Cardiovascular effects of PDE-5 inhibitors may be potentially hazardous in patients with:

- active coronary ischemia (not on nitrates)
- heart failure and with borderline low blood pressure and borderline low volume status
- complicated, multidrug antihypertensive regimens
- potential for drug-drug interactions that may prolong PDE-5 inhibitor half-life (eg, drugs that inhibit cytochrome P450 3A4)

Additional guidelines for the treatment of ED in patients with cardiovascular disease have also been published (Jackson, 2006). These guidelines, referred to as the Princeton II Guidelines, support the use of PDE-5 inhibition only in patients with asymptomatic coronary disease and <3 of the following risk factors: Controlled hypertension, mild stable angina, successful coronary revascularization, previous uncomplicated MI (>6-8 weeks), mild valvular disease, and left ventricular dysfunction (with or without NYHA Class I limitations).

When nitrate administration becomes medically necessary, the ACC/AHA 2004 guidelines on treatment of ST-segment elevation MI and the ACC/AHA 2007 guidelines on treatment of unstable angina/non ST-segment elevation MI supports administration of nitrates only if 24 hours have elapsed after use of sildenafil and 48 hours after use of tadalafil. The appropriate delay for the use of nitrates after vardenafil has not been determined.

Vardenafil is selective for PDE-5 and has limited effect on PDE-3, which controls cardiac contractility.

Anesthesia and Critical Care Concerns/Other Considerations

Cardiovascular effects of PDE-5 inhibitors may be potentially hazardous in patients with:

- active coronary ischemia (not on nitrates)
- heart failure and with low blood pressure and low volume status
- complicated, multidrug antihypertensive regimens
- potential for drug-drug interactions that may prolong PDE-5 inhibitor half-life (eg, drugs that inhibit CYP3A4)

Vardenafil is selective for PDE-5 and has limited effect on PDE3, which controls cardiac contractility.

Index Terms Vardenafil Hydrochloride

Special Alerts

Varenicline: Psychiatric and Central Nervous System Adverse Events- Health Canada Issues Alert to Canadian Healthcare Professionals - June 2008

The Canadian Dear Healthcare Provider letter can be found at http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/champix_hpc-cps-eng.php

Varenicline: Psychiatric and Central Nervous System Adverse Events - Updated May 16, 2008

These product labeling changes have previously been incorporated into the varenicline Lexi-Comp monograph.

The FDA MedWatch alert can be found at http://www.fda.gov/medwatch/safety/2007/safety07.htm#Chantix

Pronunciation(var e NI kleen)
U.S. Brand NamesChantix®
Canadian Brand NamesChampix®
Pharmacologic CategoryPartial Nicotine Agonist; Smoking Cessation Aid
Use: Labeled IndicationsTreatment to aid in smoking cessation
Dosing: Adults**Smoking cessation:** Oral:

Initial:

Days 1-3: 0.5 mg once daily

Days 4-7: 0.5 mg twice daily

Maintenance (≥ Day 8): 1 mg twice daily

Note: Start 1 week before target quit date. Patients who cannot tolerate adverse events may require temporary reduction in dose. If patient successfully quits smoking during the 12 weeks, may continue for another 12 weeks to help maintain success. If not successful in first 12 weeks, then stop medication and reassess factors contributing to failure.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} ≥30 mL/minute: No adjustment required

Cl_{cr} <30 mL/minute: Initiate: 0.5 mg once daily; maximum dose: 0.5 mg twice daily

Hemodialysis: Maximum dose: 0.5 mg once daily

Dosing: Hepatic ImpairmentDosage adjustment not required
Dosing: Adjustment for ToxicityLower dose for a period of time, then increase again.
Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister with food and glass of water.
Dietary ConsiderationsShould be given with food and a full glass of water to decrease gastric upset.
StorageStore at controlled room temperature of 25°C (77°F).
RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.
ContraindicationsThere are no contraindications listed within the manufacturer's labeling.
Warnings/Precautions

Concerns related to adverse effects:

- Nausea: Dose-dependent nausea may occur; both transient and persistent nausea has been reported. Dosage reduction may be considered for intolerable nausea.

- Neuropsychiatric effects: Neuropsychiatric symptoms, including suicidal thoughts and erratic/aggressive behavior, have been reported with use as well as following withdrawal of varenicline. Smoking cessation (with or without treatment) is associated with nicotine withdrawal symptoms and the exacerbation of underlying psychiatric illness, however, some of the behavioral disturbances were reported in patients who continued to smoke. Monitor patients for behavioral changes and psychiatric symptoms (eg, agitation, depression, suicidal behavior, suicidal ideation); inform patients to discontinue treatment and contact their healthcare provider immediately if they experience any behavioral and/or mood changes.

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The FAA has banned varenicline for pilots and air traffic controllers, and the FMCSA, which governs the commercial trucking/busing industry, is advising against issuance of commercial operator licenses for individuals taking the drug.

Disease-related concerns:

- Psychiatric illness: Patients with pre-existing psychiatric illness (eg, bipolar disorder, major severe depression, schizophrenia) were not studied in clinical trials; safety and efficacy has not been established in these populations. Due to rare neuropsychiatric events, caution is warranted if treatment is initiated; worsening of psychiatric illness has been reported.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required with severe impairment.

Concurrent drug therapy issues:

- Nicotine: Safety and efficacy of varenicline with other smoking cessation therapies have not been established; increased adverse events when used concurrently with nicotine replacement therapy.

Special populations:

- Pediatrics: The manufacturer does not recommend use in patients <18 years of age.

Geriatric ConsiderationsDosage adjustment for renal function may be necessary. Although studies to date do not demonstrate any significant pharmacokinetic differences between elderly (65-75 years of age) and younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies, however, decreased fertility, decreased fetal weight, and increased auditory startle response were observed in the offspring. There are no adequate or well-controlled studies in pregnant women. Use only if benefit outweighs the potential risk to fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Insomnia (18% to 19%), headache (15% to 19%), abnormal dreams (9% to 13%)

Gastrointestinal: Nausea (16% to 40%; dose related)

1% to 10%:

Central nervous system: Sleep disorder (≤5%), somnolence (3%), nightmares (1% to 2%), lethargy (1% to 2%), malaise (≤7%)

Dermatologic: Rash (≤3%)

Gastrointestinal: Flatulence (6% to 9%), abdominal pain (≤7%), constipation (5% to 8%), abnormal taste (5% to 8%), xerostomia (≤6%), dyspepsia (5%), vomiting (1% to 5%), appetite increased (3% to 4%), anorexia (≤2%), gastroesophageal reflux (1%)

Respiratory: Dyspnea (≤2%), rhinorrhea (≤1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute coronary syndrome, acute renal failure, aggression, agitation, amnesia, anemia, angina, anxiety, arrhythmia, asthma, atrial fibrillation, attention disturbance, behavioral changes, blindness (transient), blurred vision, bradycardia, bradyphrenia, cardiac flutter, cataract, cerebrovascular accident, chest pain, chills, conjunctivitis, coronary artery disease, cor pulmonale, deafness, depression, dermatitis, diabetes mellitus, diarrhea, disorientation, dissociation, dizziness, dysarthria, dysphagia, ECG abnormal, eczema, edema, emotional disorder, enterocolitis, epistaxis, erectile dysfunction, eructation, erythema, esophagitis, euphoria, facial palsy, fever, flu-like syndrome, flushing, gall bladder disorder, gastritis, gastric ulcer, gastrointestinal hemorrhage, gingivitis, hallucinations, hyperhidrosis, hyper-/hypokalemia, hyperlipidemia, hypersensitivity, hyper-/hypotension, hypoglycemia, intestinal obstruction, irritability, leukocytosis, libido decreased, liver function test abnormal, lymphadenopathy, mental impairment, MI, migraine, mood swings, mouth ulceration, muscle enzyme increased, musculoskeletal pain, multiple sclerosis, myositis, nephrolithiasis, night blindness, nocturia, nystagmus, ocular vascular disorder, osteoporosis, palpitation, pancreatitis, parosmia, peripheral ischemia, photophobia, photosensitivity, pleurisy, polyuria, psoriasis, psychomotor impairment, psychotic disorder, pulmonary embolism, restless leg syndrome, restlessness, seizure, sexual dysfunction, splenomegaly, suicidal behavior, suicidal ideation, suicide, syncope, tachycardia, thinking abnormal, thrombocytopenia, thrombosis, thyroid disorder, tinnitus, transient ischemic attack, tremor, urinary retention, urticaria, ventricular extrasystoles, vertigo, visual field defect, vitreous floaters, weight gain, xerophthalmia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor for behavioral changes and psychiatric symptoms (eg, agitation, depression, suicidal behavior, suicidal ideation)

Nursing: Physical Assessment/MonitoringProvide educational materials and counseling to support an attempt at quitting smoking. Carefully instruct patient in appropriate titration of doses. Monitor for behavioral and emotional changes and suicide ideation. Monitor other medications patient is taking for potential need for dose adjustment after quitting smoking.

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Start medication 1 week prior to quit date designated. Take after eating with a full glass of water. You may experience nausea (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help), vomiting, constipation (increasing exercise, fluids, fruit/fiber may help), headaches, problems sleeping, or unusual dreams. Use caution when driving or engaging in potentially hazardous tasks until response to drug is known.

Report persistent symptoms (depression, suicide ideation, or emotional/behavioral changes) to prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Chantix®: 0.5 mg, 1 mg

Combination package, oral [dose-pack]:

Chantix®:

Tablet, oral: 0.5 mg (11) [white tablets]

Tablet, oral: 1 mg (42) [light blue tablets]

Generic AvailableNo

ManufacturerPfizer, Inc

Pricing: U.S. (www.drugstore.com)

Misc (Chantix Starting Month Pak)

0.5 MG X 11 & 1 MG X 42 (53): $124.99

Tablets (Chantix)

0.5 mg (56): $120.98

1 mg (56): $119.99

Tablets (Chantix Continuing Month Pak)

1 mg (56): $124.99

Mechanism of ActionPartial neuronal alpha$_4$ β$_2$ nicotinic receptor agonist; prevents nicotine stimulation of mesolimbic dopamine system associated with nicotine addiction. Also binds to 5 HT$_3$ receptor (significance not determined) with moderate affinity. Varenicline stimulates dopamine activity but to a much smaller degree than nicotine does, resulting in decreased craving and withdrawal symptoms.

Pharmacodynamics/Kinetics

Absorption: Well absorbed; unaffected by food

Protein binding: ≤20%

Metabolism: Minimal (<10% of clearance is through metabolism)

Half-life elimination: ~24 hours

Time to peak, plasma: ~3-4 hours

Excretion: Primarily urine (92% as unchanged drug)

Related Information

- Addiction Treatments

Pharmacotherapy PearlsIn all studies, patients received an educational booklet on smoking cessation and received up to 10 minutes of counseling at each weekly visit. Dosing started 1 week before target quit date. Successful cessation of smoking may alter pharmacokinetic properties of other medications (eg, theophylline, warfarin, insulin).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsVarenicline Tartrate

Varicella Virus Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Varicella virus vaccine has been given in error (instead of the indicated varicella immune globulin) to pregnant women exposed to varicella.

Both varicella vaccine and zoster vaccine are live, attenuated strains of varicella-zoster virus. Their indications, dosing, and composition are distinct. Varicella is indicated in children to prevent chickenpox, while zoster vaccine is indicated in older individuals to prevent reactivation of the virus which causes shingles. Zoster vaccine is **not** a substitute for varicella vaccine and should not be used in children.

Pronunciation(var i SEL a VYE rus vak SEEN)
U.S. Brand NamesVarivax®
Canadian Brand NamesVarilrix®; Varivax® III
Pharmacologic CategoryVaccine
Use: Labeled IndicationsImmunization against varicella in children ≥12 months of age and adults

The ACIP recommends vaccination for all children, adolescents, and adults who do not have evidence of immunity. Vaccination is especially important for:

- Persons with close contact to those at high risk for severe disease
- Persons living or working in environments where transmission is likely (teachers, child-care workers, residents and staff of institutional settings)
- Persons in environments where transmission has been reported
- Nonpregnant women of childbearing age
- Adolescents and adults in households with children
- International travelers

Postexposure prophylaxis: Vaccination within 3 days (possibly 5 days) after exposure to rash is effective in preventing illness or modifying severity of disease

Dosing: Adults**Varicella immunization:** SubQ: 2 doses of 0.5 mL separated by 4-8 weeks
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Children 12 months to 12 years: Varicella immunization: SubQ: 0.5 mL; a second dose may be administered ≥3 months later

Note: The ACIP recommends the routine childhood vaccination be 2 doses, with the first dose administered at 12-15 months of age. School age children should receive the second dose at 4-6 years of age, but it may be administered earlier provided ≥3 months have elapsed after the first dose. All children and adolescents who received only 1 dose of vaccine should receive a second dose.

Children ≥13 years: Varicella immunization: Refer to adult dosing.

Administration: I.M.SubQ administration is recommended; however, doses inadvertently given I.M. have resulted in similar seroconversion.
Administration: I.V.Do not administer I.V.
Administration: OtherInject immediately after reconstitution; inject SubQ into the outer aspect of the upper arm, if possible.
StorageStore powder in freezer at -15°C (5°F) or colder; protect from light. Store diluent separately at room temperature or in refrigerator. Powder may be stored under refrigeration for up to 72 continuous hours prior to reconstitution; if not used within 72 hours, vaccine should be discarded. Following reconstitution, discard reconstituted vaccine if not used within 30 minutes.

Canadian formulations: **Note:** Varicella vaccine has been reformulated to produce a refrigerator-stable preparation. Previously, the product required storage in a freezer prior to reconstitution. The new Canadian formulation may be stored in a freezer, but if transferred to a refrigerator, may not be refrozen. Individual product labeling should be consulted to confirm proper conditions.

ReconstitutionUse 0.7 mL of the provided diluent to reconstitute vaccine. Gently agitate to mix thoroughly. (Total volume of reconstituted vaccine will be ~0.5 mL.)
ContraindicationsHypersensitivity to any component of the vaccine; individuals with blood dyscrasias, leukemia, lymphomas, or other malignant neoplasms affecting the bone marrow or lymphatic systems; those receiving immunosuppressive therapy; primary and acquired immunodeficiency states; family history of congenital or hereditary immunodeficiency; active, untreated tuberculosis; current febrile illness (per manufacturer labeling); pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: May administer to patients with mild acute illness (with or without low grade fever per CDC guidelines).
- HIV: Children with HIV infection with age-specific CD4+ T-lymphocyte percentages ≥15% may receive live attenuated varicella vaccine. Vaccination may be considered for adolescents and adults with CD4+ T-lymphocyte counts ≥200 cells/µL.

Concurrent drug therapy issues:

- Immune globulin: Defer vaccination for at least 5 months following immune globulin (IgG), or VZIG (avoid IgG or IVIG use for 2 months following vaccination).
- Salicylates: Avoid salicylates for 6 weeks after vaccination; varicella may increase the risk of Reye's syndrome.

Dosage form specific issues:

- Albumin: Products may contain albumin.
- Gelatin: Products may contain gelatin.
- Neomycin: Products may contain neomycin.

Other warnings/precautions:

- Blood products: Defer vaccination for at least 5 months following blood or plasma transfusions.
- Transmission of virus: Vaccinated individuals should not have close association with susceptible high-risk individuals (newborns, pregnant women, immunocompromised persons) for 6 weeks following vaccination.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Varivax® should not be administered to pregnant females and pregnancy should be avoided for 3 months (per manufacturer labeling; 1 month per ACIP) following vaccination. A pregnancy registry has been established for pregnant women exposed to varicella virus vaccine (800-986-8999). Varicella disease during the 1st or 2nd trimesters may result in congenital varicella syndrome. The onset of maternal varicella infection from 5 days prior to 2 days after delivery may cause varicella infection in the newborn. All women should be assessed for immunity during a prenatal visit; those without evidence of immunity should be vaccinated upon completion or termination of pregnancy.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Fever (10% to 15%)

Local: Injection site reaction (19% to 33%)

1% to 10%:

Central nervous system: Chills, fatigue, headache, irritability, malaise, nervousness, sleep disturbance

Dermatologic: Generalized varicella-like rash (1% to 6%), contact rash, dermatitis, diaper rash, dry skin, eczema, heat rash, itching

Gastrointestinal: Abdominal pain, appetite decreased, cold/canker sore, constipation, diarrhea, nausea, vomiting

Hematologic: Lymphadenopathy

Local: Varicella-like rash at the injection site (1% to 3%)

Neuromuscular & skeletal: Arthralgia, myalgia, stiff neck

Otic: Otitis

Respiratory: Cough, lower/upper respiratory illness

Miscellaneous: Allergic reactions, teething

<1%: Febrile seizure, pneumonitis

Postmarketing/case reports: Anaphylaxis, aseptic meningitis, ataxia, Bell's palsy, cellulitis, cerebellar ataxia (acute), cerebrovascular accident, disseminated varicella infection, dizziness, encephalitis, erythema multiforme, Guillain-Barré syndrome, hemiparesis (acute), Henoch-Schönlein purpura, hepatitis, herpes zoster, impetigo, nonfebrile seizure, paresthesia, pharyngitis, pneumonia, secondary skin infection, Stevens-Johnson syndrome, thrombocytopenia, transverse myelitis, urticaria

Drug Interactions

5-ASA Derivatives: May enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. The primary concern is the potential development of Reye's Syndrome, a condition that has been associated with the use of salicylates in children with varicella infections. *Risk D: Consider therapy modification*

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Salicylates: May enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Smallpox Vaccine: May enhance the adverse/toxic effect of Varicella Virus Vaccine. It may be difficult to determine which vaccine caused skin lesions or other adverse effects. *Risk D: Consider therapy modification*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Monitoring Parameters Rash, fever

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, powder for reconstitution [preservative free]:

Varivax®: 1350 plaque-forming units (PFU) [contains gelatin and trace amounts of neomycin; packaged with diluent]

Varivax® III [CAN]: 1350 plaque-forming units (PFU) [contains gelatin and trace amounts of neomycin; packaged with diluent; not available in U.S.]

Injection, powder for reconstitution (Valrilix® [CAN]): $10^{3.3}$ plaque-forming units (PFU) [contains albumin and gelatin; packaged with diluent; not available in U.S.]

Generic Available No

Manufacturer Merck & Co

Mechanism of Action As a live, attenuated vaccine, varicella virus vaccine offers active immunity to disease caused by the varicella-zoster virus

Pharmacodynamics/Kinetics

Onset of action: Seroconversion: ~4-6 weeks

Duration: Antibody titers detectable at 10 years postvaccination

Related Information

- Immunization Recommendations

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Evidence of immunity to varicella includes any of the following:

Documentation of age appropriate vaccination with varicella vaccine.

Laboratory evidence of immunity or laboratory confirmation of disease.

Birth in the United States prior to 1980 (except for health care personnel, pregnant women and the immunocompromised).

Diagnosis or verification of varicella disease by healthcare provider.

Diagnosis or verification of herpes zoster by healthcare provider.

Persons who lack evidence of immunity should be vaccinated.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Cold/canker sores.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause fatigue, irritability, nervousness, or sleep disturbances

Mental Health: Effects on Psychiatric Treatment None reported

Mental Health Comment Case reports of Guillain-Barré syndrome

Index Terms Chickenpox Vaccine; Varicella-Zoster Virus (VZV) Vaccine (Varicella); VZV Vaccine (Varicella)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Varicella virus vaccine has been given in error (instead of the indicated varicella immune globulin) to pregnant women exposed to varicella.

Pronunciation(var i SEL a- ZOS ter i MYUN GLOB yoo lin HYU man)

Canadian Brand NamesVariZIG™

Pharmacologic CategoryImmune Globulin

Use: Labeled IndicationsIn pregnant women, for the prevention or reduction in severity of maternal infection within 4 days of exposure to the varicella zoster virus.

Use: Unlabeled/InvestigationalIn the United States, the Centers for Disease Control and Prevention (CDC) recommends varicella-zoster immune globulin (VZIG) for the passive immunization of patients who are at a greater risk of complications following significant exposure to varicella and do not have evidence of immunity. Guidelines restrict administration to those patients meeting the following criteria:

- Immunocompromised patients without evidence of immunity, including those with neoplastic disease (eg, leukemia or lymphoma); primary or acquired immunodeficiency; immunosuppressive therapy (including steroid therapy equivalent to prednisone ≥2 mg/kg or 20 mg/day)
- Newborn of mother who had onset of varicella (chickenpox) within 5 days before delivery or within 48 hours after delivery
- Premature infants (≥28 weeks gestation) whose mother has no evidence of immunity
- Premature infants (<28 weeks gestation or ≤1000 g) regardless of maternal history
- Pregnant women without evidence of immunity

Significant exposure includes:

Continuous household contact

Face-to-face indoor contact (>5 minutes or >1 hour depending on reference)

Hospital contact (in same 2-4 bedroom or adjacent beds in a large ward or prolonged face-to-face contact with an infectious staff member or patient)

Dosing: Adults**Prevention or reduction of maternal infection (approved use), passive immunization (unlabeled use):** I.M., I.V.: 125 int. units/10 kg (minimum dose: 125 int. units; maximum dose: 625 int. units). Administer within 96 hours of exposure.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Passive immunization (unlabeled use):** I.M., I.V.: Refer to adult dosing.

Administration: I.M.For I.M. or I.V. administration. Bring to room temperature prior to use. Should be given as soon as possible following exposure; efficacy has not been established for use >96 hours following exposure. For I.M. injection, administer into deltoid muscle or anterolateral aspect of upper thigh; avoid gluteal region.

Administration: I.V.For I.M. or I.V. administration. Bring to room temperature prior to use. Should be given as soon as possible following exposure; efficacy has not been established for use >96 hours following exposure. For I.V. administration, inject over 3-5 minutes.

StoragePrior to reconstitution, store at 2°C to 8°C (36°F to 48°F); do not freeze. Following reconstitution, may store at 2°C to 8°C (36°F to 48°F) for up to 12 hours.

ReconstitutionReconstitute only with provided diluent. Inject diluent slowly and at an angle onto the inside glass wall of the vial. Gently invert vial and swirl to dissolve; do not shake. For I.V. administration, reconstitute with 2.5 mL/vial (provides 50 int. units/mL). For I.M. administration, reconstitute with 1.25 mL/vial (provides 100 int. units/mL).

RestrictionsVaricella-zoster immune globulin (VZIG) was discontinued in the United States in 2005. It is currently available as VariZIG™ under an Investigational New Drug Application Expanded Access protocol. Inventory for anticipated patients may be obtained by contacting FFF Enterprises at 800-843-7477 and faxing a release form. The release form can be accessed from the CDC (available at http://www.fda.gov/cber/infosheets/mphvzig020806.htm). VariZIG™ may also be prepositioned at qualified sites.

ContraindicationsSevere reaction associated with past human immune globulin administration; hypersensitivity to any component of the formulation; patients with evidence of immunity; IgA deficiency

Note: U.S. CDC guidelines: Healthy and immunocompromised patients (except bone marrow transplant recipients [BMT]) with positive history of varicella infection are considered immune. BMT patients who had varicella infection *prior to* transplant are **not** considered immune; however, the expanded access protocol does not include use for this indication. BMT patients who develop varicella infection *after* transplant **are** considered immune. Patients who are fully vaccinated, but later became immunocompromised should be monitored closely; treatment with VZIG is not indicated, but other therapy may be needed if disease occurs.

Warnings/Precautions

Boxed warnings:

- Anaphylaxis/hypersensitivity reactions: See “Concerns related to adverse effects” below.
- Human plasma: See “Dosage form specific issue” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: **[Canadian Boxed Warning]: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Reactions can occur in patients with IgA deficiency or hypersensitivity reactions to human globulin.**
- Pulmonary edema: Monitor for transfusion-related acute lung injury (TRALI); noncardiogenic pulmonary edema has been reported with intravenous administration of immune globulin. Use caution with preexisting respiratory conditions. I.M. administration may be preferred in this patient population.
- Renal impairment: Acute renal dysfunction (increased serum creatinine, oliguria, acute renal failure) can rarely occur; usually within 7 days of use (more likely with products stabilized with sucrose). Use with caution in the elderly, patients with renal disease, diabetes mellitus, volume depletion, sepsis, paraproteinemia, and nephrotoxic medications due to risk of renal dysfunction.
- Thrombotic events: Thrombotic events have been reported with administration of intravenous immune globulin; use with caution in patients with cardiovascular risk factors. I.M. administration may be preferred in this patient population.

Special populations:

- Elderly: Safety and efficacy have not been established in patients >65 years of age.
- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

Dosage form specific issues:

- Human plasma: **[Canadian Boxed Warnings]: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk.** Infections thought to be transmitted by this product should be reported to the manufacturer (Cangene Corporation 800-768-2304)

Pregnancy Considerations

Animal reproduction studies have not been conducted. Clinical use of other immunoglobulins suggest that there are no adverse effects on the fetus. Pregnant women who do not have evidence of immunity to varicella may be at increased risk of infection following exposure. VZIG is used to prevent maternal complications, not fetal infection.

Lactation

Excretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (7% to 11%)

Local: Injection site pain (17% to 47%)

1% to 10%:

Central nervous system: Dizziness (up to 5%), fever (up to 5%), pain (up to 5%), chills (up to 2%), fatigue (up to 2%), flushing (up to 2%), insomnia (up to 2%)

Dermatologic: Rash (up to 4%), dermatitis (up to 2%), erythematous rash (up to 2%)

Gastrointestinal: Nausea (2% to 5%), dysgeusia (up to 2%)

Local: Injection site bruising, itching, or tenderness (up to 2%)

Neuromuscular & skeletal: Neck pain (up to 5%), myalgia (up to 2%)

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test Interactions

May cause false-positive test for immunity to VZV for 3 months following administration. May cause a false-positive Coomb’s test.

Monitoring Parameters

Observe for adverse effects for 20 minutes following administration. The CDC also recommends monitoring for signs and symptoms of varicella infection for 28 days after VZIG administration.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN = Canadian brand name]

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Pitressin® may be confused with Pitocin®

Pronunciation(vay soe PRES in)

Canadian Brand NamesPressyn®; Pressyn® AR

Pharmacologic CategoryAntidiuretic Hormone Analog; Hormone, Posterior Pituitary

Use: Labeled IndicationsTreatment of diabetes insipidus; differential diagnosis of diabetes insipidus

Use: Unlabeled/InvestigationalAdjunct in the treatment of GI hemorrhage and esophageal varices; pulseless arrest (ventricular tachycardia [VT]/ventricular fibrillation [VF], asystole/pulseless electrical activity [PEA]); vasodilatory shock (septic shock)

Dosing: Adults

Diabetes insipidus:Note: Dosage is highly variable; titrated based on serum and urine sodium and osmolality in addition to fluid balance and urine output; vasopressin rarely used for this indication; other therapies are available.

I.M., SubQ: 5-10 units 2-3 times/day as needed

Continuous I.V. infusion (unlabeled route): 0.0005 unit/kg/hour; double dosage as needed every 30 minutes to a maximum of 0.01 unit/kg/hour

Variceal hemorrhage (unlabeled use):*Continuous I.V. infusion:* Dilute in NS or D_5W to 0.1-1 unit/mL. **Note:** Other therapies may be preferred.

[AASLD guidelines, 2007]: Continuous I.V. infusion: Initial: 0.2-0.4 units/minute, may titrate dose as needed to a maximum dose of 0.8 units/minute; maximum duration: 24 hours at highest effective dose continuously (to reduce incidence of adverse effects). Patient should also receive I.V. nitroglycerin concurrently to prevent myocardial ischemic complications. Monitor closely for signs/symptoms of ischemia (myocardial, peripheral, bowel).

Pulseless arrest (unlabeled use) [ACLS, 2005]:*I.V., I.O.:* 40 units; may give 1 dose to replace first or second dose of epinephrine. I.V./I.O. drug administration is preferred, but if no access, may give endotracheally. ACLS guidelines do not recommend a specific endotracheal dose; however, may be given endotracheally using the same I.V. dose (Wenzel, 1997). Mix with 5-10 mL of water or normal saline, and administer down the endotracheal tube.

Vasodilatory shock/septic shock (unlabeled use):*I.V.:* 0.01-0.04 units/minute for the treatment of septic shock. Doses >0.04 units/minute may have more cardiovascular side effects. Most case reports have used 0.04 units/minute continuous infusion as a fixed dose.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Diabetes insipidus:Note: Dosage is highly variable; titrated based on serum and urine sodium and osmolality in addition to fluid balance and urine output; vasopressin rarely used for this indication; other therapies are available.

I.M., SubQ: 2.5-10 units 2-4 times/day as needed

Continuous I.V. infusion (unlabeled route): 0.0005 unit/kg/hour; double dosage as needed every 30 minutes to a maximum of 0.01 unit/kg/hour

GI hemorrhage (unlabeled use): Continuous I.V. infusion: Dilute in NS or D_5W to 0.1-1 unit/mL. **Note:** Other therapies may be preferred.

Initial I.V. bolus: 0.3 units/kg (maximum: 20 units) may be given

Continuous I.V. infusion: 0.001-0.01 units/kg/minute; titrate dose as needed; maximum: 0.01 unit/kg/minute; if bleeding controlled for 12-24 hours, then taper off over 24-36 hours

Dosing: Hepatic ImpairmentSome patients respond to much lower doses with cirrhosis.

Administration: I.V.

GI hemorrhage: Administration requires the use of an infusion pump.

Infusion rates: 100 units in 500 mL D_5W rate

0.1 unit/minute: 30 mL/hour

0.2 unit/minute: 60 mL/hour

0.3 unit/minute: 90 mL/hour

0.4 unit/minute: 120 mL/hour

0.5 unit/minute: 150 mL/hour

0.6 unit/minute: 180 mL/hour

Vasodilatory shock: Administration through a central catheter is recommended.

Administration: I.V. DetailUse extreme caution to avoid extravasation because of risk of necrosis and gangrene. In treatment of varices, infusions are often supplemented with nitroglycerin infusions to minimize cardiac effects.
Administration: TopicalTopical administration on nasal mucosa: Administer injectable vasopressin on cotton plugs, as nasal spray, or by dropper. Should not be inhaled.
Administration: OtherIf no I.V./I.O. access may give endotracheally. ACLS guidelines do not recommend a specific endotracheal dose; however, may be given endotracheally using the same I.V. dose (Wenzel, 1997). Mix with 5-10 mL of water or normal saline, and administer down the endotracheal tube.
StorageStore injection at room temperature; do not freeze. Protect from heat. Use only clear solutions.
CompatibilityStable in D_5W, NS.

Compatibility when admixed: Compatible: Verapamil.

ContraindicationsHypersensitivity to vasopressin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- I.V. infiltration: May lead to severe vasoconstriction and localized tissue necrosis; also, gangrene of extremities, tongue, and ischemic colitis.

- Water intoxication: May cause water toxication; early signs include drowsiness, listlessness, and headache, these should be recognized to prevent coma and seizures.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, including arteriosclerosis.

- Goiter: Use with caution in patients with a goiter with cardiac complications.

- Migraine: Use with caution in patients with a history of migraines.

- Renal impairment: Use with caution in patients with renal disease, including chronic nephritis with nitrogen retention (manufacturing labeling notes therapy contraindicated until nitrogen levels reduced).

- Seizures: Use with caution in patients with a history of seizure disorder.

- Vascular disease: Use with caution in patients with vascular disease.

Special populations:

- Elderly: Caution elderly patients not to increase their fluid intake beyond that sufficient to satisfy their thirst in order to avoid water intoxication and hyponatremia; under experimental conditions, the elderly have shown to have a decreased responsiveness to vasopressin with respect to its effects on water homeostasis.

Geriatric ConsiderationsElderly patients should be cautioned not to increase their fluid intake beyond that sufficient to satisfy their thirst in order to avoid water intoxication and hyponatremia. Under experimental conditions, the elderly have shown to have a decreased responsiveness to vasopressin with respect to its effects on water homeostasis.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Vasopressin and desmopressin have been used safely during pregnancy based on case reports.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsBased on case reports, vasopressin and desmopressin have been used safely during nursing.
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, asystole (>0.04 units/minute), blood pressure increased, cardiac output decreased (>0.04 units/minute), chest pain, MI, vasoconstriction (with higher doses), venous thrombosis

Central nervous system: Pounding in head, fever, vertigo

Dermatologic: Ischemic skin lesions, circumoral pallor, urticaria

Gastrointestinal: Abdominal cramps, flatulence, mesenteric ischemia, nausea, vomiting

Genitourinary: Uterine contraction

Neuromuscular & skeletal: Tremor

Respiratory: Bronchial constriction

Miscellaneous: Diaphoresis

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to effects on ADH).

Monitoring ParametersSerum and urine sodium, urine specific gravity, urine and serum osmolality; urine output, fluid input and output, blood pressure, heart rate

Reference RangePlasma: 0-2 pg/mL (SI: 0-2 ng/L) if osmolality <285 mOsm/L; 2-12 pg/mL (SI: 2-12 ng/L) if osmolality >290 mOsm/L

Nursing: Physical Assessment/MonitoringEvaluate patient history closely for use cautions. Assess potential for interactions with other pharmacological agents patient may be taking (eg, concurrent use that will block or enhance antidiuretic response). **Note:** Dosing and administration vary according to purpose for use. I.V. requires use of infusion pump and close monitoring to prevent extravasation (may cause severe necrosis and gangrene). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, cardiac status, blood pressure, CNS status, fluid balance, signs or symptoms of water intoxication, intranasal irritation) on a regular basis during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsSerum and urine sodium, urine specific gravity, urine and serum osmolality

Patient EducationThis drug will usually be administered by infusion or injection and you will be closely monitored. Report immediately any chest pain or palpitations; difficulty breathing; abdominal cramping; redness, swelling, pain, or burning at infusion/injection site; or any other adverse effects. May cause dizziness or drowsiness (use caution when changing position or engaging in potentially hazardous tasks until response to drug is known). Report persistent nausea, vomiting, or abdominal cramps; tremor, acute headache, or dizziness; chest pain or irregular heartbeat; respiratory difficulty or excessive perspiration; CNS changes (confusion, drowsiness); or runny nose or painful nasal membranes (intranasal use). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 20 units/mL (0.5 mL, 1 mL, 10 mL)

Generic AvailableYes

Mechanism of ActionIncreases cyclic adenosine monophosphate (cAMP) which increases water permeability at the renal tubule resulting in decreased urine volume and increased osmolality; causes peristalsis by directly stimulating the smooth muscle in the GI tract; direct vasoconstrictor without inotropic or chronotropic effects

Pharmacodynamics/Kinetics

Onset of action: Nasal: 1 hour

Duration: Nasal: 3-8 hours; I.M., SubQ: 2-8 hours

Metabolism: Nasal/Parenteral: Hepatic, renal

Half-life elimination: Nasal: 15 minutes; Parenteral: 10-20 minutes

Excretion: Nasal: Urine; SubQ: Urine (5% as unchanged drug) after 4 hours

Pharmacotherapy PearlsVasopressin increases factor VIII levels and may be useful in hemophiliacs.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay be somewhat useful as a treatment for lithium-induced diabetes insipidus; hydrochlorothiazide and amiloride are more effective, less expensive options

Anesthesia and Critical Care Concerns/Other Considerations

Shock: Low-dose vasopressin may be effective for the management of vasodilator shock. Vasopressin binds to different receptors than the catecholamine pressors. Vasoconstrictor effects are through the V_1 vascular receptors. In clinical studies and case reports, vasopressin increased blood pressure, systemic vascular resistance, and urine output. Vasopressin may decrease heart rate and cardiac output, especially at higher doses. Vasopressin has been used in doses of 0.01-0.1 units/minute. Doses >0.04 units/minute may have more cardiovascular effects (decreased cardiac output, asystole, cardiac ischemia). Use caution in patients with underlying cardiac dysfunction. Vasoconstriction appears to remain effective in severe acidosis. When possible, low-dose vasopressin should be infused via central catheter for the management of vasodilatory shock; peripheral administration has been associated with skin necrosis.

The 2008 Surviving Sepsis Campaign guidelines (Dellinger, 2007) suggest vasopressin should not be administered as the initial vasopressor in septic shock. Vasopressin 0.03 units/minute may be added to norepinephrine with anticipation of an effect equivalent to norepinephrine alone (Grade 2C).

Pulseless Arrest: A multicenter, double-blind, randomized, controlled trial evaluated the efficacy of vasopressin or epinephrine when administered to adult patients who suffered an out-of-hospital cardiac arrest (Wenzel, 2004). For inclusions, patients presented with ventricular fibrillation, pulseless electrical activity, or asystole. They were excluded if they were successfully defibrillated without the administration of a vasopressor, had a terminal illness or a DNR order, a lack of intravenous access, hemorrhagic shock, pregnancy, cardiac arrest due to trauma, or were <18 years of age. Eligible patients were randomized to intravenous vasopressin (40 units) or epinephrine (1 mg). Each patient received an injection of the study drug. If spontaneous circulation was not restored in 3 minutes, they received a second dose (same amount) of the same study drug. If there was no response, the managing physician had the option of giving epinephrine. Patients with ventricular fibrillation were randomized if the first three attempts at defibrillation failed; all others were randomized immediately. The primary endpoint was survival to hospital admission; the secondary endpoint was survival to hospital discharge. Five hundred and eighty-nine patients were randomized to vasopressin and 597 patients were randomized to epinephrine. There was no significant difference in the rate of hospital admission between the vasopressin group and the epinephrine group if they had ventricular fibrillation (46.2% vs 43% respectively, p: 0.48) or pulseless electrical activity (33.7% vs 30.5% respectively, p: 0.65). Patients with asystole responded significantly better to vasopressin; having higher rates of hospital admission (29% vs 20.3% in the epinephrine group, p: 0.02) and hospital discharge (4.7% vs 1.5% in the epinephrine group, p: 0.04). Patients who failed vasopressin therapy and received additional epinephrine had significant improvement in survival to hospital admission (25.7% vs 16.4% in the epinephrine group, p: 0.002) and discharge (6.2% vs 1.7%, p: 0.002). Similar patients who were randomized to epinephrine and failed to respond did not improve with additional epinephrine. Cerebral performance among all patients who survived to discharge was similar in both groups. In this trial, vasopressin was superior to epinephrine in patients with asystole. Vasopressin followed by epinephrine may be more effective than epinephrine alone in refractory out-of-hospital cardiac arrest.

A small in-hospital cardiac arrest study evaluated the efficacy of vasopressin or epinephrine in 200 patients. These investigators did not find any differences between the two treatment groups with regard to survival, discharge, or cerebral performance (Stiell, 2001).

Index Terms8-Arginine Vasopressin; ADH; Antidiuretic Hormone

Vecuronium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Vecuronium may be confused with vancomycin

Norcuron® may be confused with Narcan®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(vek ue ROE nee um)

U.S. Brand NamesNorcuron® [DSC]

Canadian Brand NamesNorcuron®

Pharmacologic CategoryNeuromuscular Blocker Agent, Nondepolarizing

Use: Labeled IndicationsAdjunct to general anesthesia to facilitate endotracheal intubation and to relax skeletal muscles during surgery; to facilitate mechanical ventilation in ICU patients; does not relieve pain or produce sedation

Dosing: Adults

Neuromuscular blockade: I.V. (do not administer I.M.):

Initial: 0.08-0.1 mg/kg or 0.04-0.06 mg/kg after initial dose of succinylcholine for intubation

Maintenance: 0.01-0.015 mg/kg 25-40 minutes after initial dose, then 0.01-0.015 mg/kg every 12-15 minutes (higher doses will allow less frequent maintenance doses); may be administered as a continuous infusion at 0.8-2 mcg/kg/minute

Pretreatment/priming: Adults: 10% of intubating dose given 3-5 minutes before initial dose

Neuromuscular blockade in ICU patients: Adults: 0.05-0.1 mg/kg bolus followed by 0.8-1.7 mcg/kg/minute once initial recovery from bolus observed or 0.1-0.2 mg/kg/dose every 1 hour

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Neuromuscular blockade: I.V. (do not administer I.M.):

Infants >7 weeks to 1 year: Initial: 0.08-0.1 mg/kg/dose; maintenance: 0.05-0.1 mg/kg/every 60 minutes as needed

Children >1 year: Refer to adult dosing.

Dosing: Hepatic ImpairmentDose reductions are necessary in patients with liver disease.

Calculations

- Vecuronium

Administration: I.V.Concentration of 1 mg/mL may be administered by rapid I.V. injection. May further dilute reconstituted vial to 0.1-0.2 mg/mL in a compatible solution for I.V. infusion. Concentration of 1 mg/mL may be used for I.V. infusion in fluid-restricted patients.

Administration: I.V. DetailpH: 4

StorageStore intact vials of powder for injection at room temperature 15°C to 30°C (59°F to 86°F). Vials reconstituted with bacteriostatic water for injection (BWFI) may be stored for 5 days under refrigeration or at room temperature. Vials reconstituted with other compatible diluents (nonbacteriostatic) should be stored under refrigeration and used within 24 hours.

ReconstitutionReconstitute with compatible solution for injection to final concentration of 1 mg/mL.

CompatibilityStable in D_5W, D_5NS, LR, NS, SWI, BWFI; ; **incompatible** with alkaline solutions/medications.

Y-Site administration: Incompatible with thiopental.

Compatibility in syringe: Incompatible with thiopental.

ContraindicationsHypersensitivity to vecuronium or any component of the formulation

Allergy Considerations

- Neuromuscular-Blocking Agent Allergy

Warnings/Precautions

Boxed warnings:

- Experienced personnel: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Bradycardia: Does not counteract bradycardia produced by anesthetics/vagal stimulation.
- Neuromuscular cross-sensitivity: Cross-sensitivity with other neuromuscular-blocking agents may occur; use extreme caution in patients with previous anaphylactic reactions.

Disease-related concerns:

- Burn injury: Resistance may occur in burn patients (>30% of body) for period of 5-70 days postinjury.
- Conditions which may antagonize neuromuscular blockade: Alkalosis, hypercalcemia, demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and diabetes mellitus may result in antagonism of neuromuscular blockade.
- Conditions which may potentiate neuromuscular blockade: Electrolyte abnormalities, severe hyponatremia, severe hypocalcemia, severe hypokalemia, hypermagnesemia, neuromuscular diseases, acidosis, acute intermittent porphyria, Eaton-Lambert syndrome, myasthenia gravis, renal failure, and hepatic failure may result in potentiation of neuromuscular blockade.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment

Special populations:

- Elderly: Use with caution in the elderly, effects and duration are more variable.
- Immobilized patients: Resistance may occur in patients who are immobilized.

Other warnings/precautions:

- Appropriate use: Maintenance of an adequate airway and respiratory support is critical.
- Experienced personnel: **[U.S. Boxed Warning]: Should be administered by adequately trained individuals familiar with its use.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse in cesarean section has been reported. Umbilical venous concentrations were 11% of maternal.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

<1%: Tachycardia, flushing, edema, hypotension, circulatory collapse, bradycardia, rash, itching, hypersensitivity reaction

Postmarketing and/or case reports: Acute quadriplegic myopathy syndrome (prolonged use), myositis ossificans (prolonged use)

Drug Interactions

Acetylcholinesterase Inhibitors: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Aminoglycosides: May enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Vecuronium. *Risk C: Monitor therapy*

Cardiac Glycosides: Neuromuscular-Blocking Agents may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Colistimethate: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Neuromuscular-Blocking Agents (Nondepolarizing) may enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Inhalational Anesthetics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Neuromuscular-Blocking Agents (Nondepolarizing). Specifically, episodes of apnea have been reported in patients using this combination. *Risk C: Monitor therapy*

Lincosamide Antibiotics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Lithium: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Loop Diuretics: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Magnesium Salts: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Vecuronium. *Risk C: Monitor therapy*

Polymyxin B: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Procainamide: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

QuiNIDine: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Vancomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, heart rate

Nursing: Physical Assessment/MonitoringOnly clinicians experienced in the use of neuromuscular-blocking drugs should administer and/or manage the use of vecuronium. Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of patient. Ventilatory support must be instituted and maintained until adequate respiratory muscle function and/or airway protection are assured. Assess other medications for effectiveness and safety. Other drugs that affect neuromuscular activity may increase/decrease neuromuscular block induced by vecuronium; monitor and adjust dosage as necessary. This drug does not cause anesthesia or analgesia; pain must be treated with appropriate analgesic agents. Continuous monitoring of vital signs, cardiac status, respiratory status, and degree of neuromuscular block (objective assessment with peripheral external nerve stimulator) is mandatory during infusion and until full muscle tone has returned. Muscle tone returns in a predictable pattern, starting with diaphragm, abdomen, chest, limbs, and finally muscles of the neck, face, and eyes. Safety precautions must be maintained until full muscle tone has returned. **Note:** It may take longer for return of muscle tone in obese or elderly patients or patients with renal or hepatic disease, myasthenia gravis, myopathy, other neuromuscular disease, dehydration, electrolyte imbalance, or severe acid/base imbalance. Provide appropriate patient teaching/support prior to and following administration.

Long-term use: Monitor level of neuromuscular blockade, skeletal muscle movement, and respiratory effort. Reposition patient and provide appropriate skin care, mouth care, and care of patient's eyes every 2-3 hours while sedated. Provide appropriate emotional and sensory support (auditory and environmental).

Patient EducationPatient will usually be unconscious prior to administration. Patient education should be appropriate to individual situation. Reassurance of constant monitoring and emotional support to reduce fear and anxiety should precede and follow administration. Following return of muscle tone, do not attempt to change position or rise from bed without assistance. Report immediately any skin rash or hives, pounding heartbeat, respiratory difficulty, or muscle tremors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as bromide: 10 mg, 20 mg [may be supplied with diluent containing benzyl alcohol]

Generic AvailableYes

Mechanism of ActionBlocks acetylcholine from binding to receptors on motor endplate inhibiting depolarization

Pharmacodynamics/Kinetics

Onset of action:

Good intubation conditions: Within 2.5-3 minutes

Maximum neuromuscular blockade: Within 3-5 minutes

Duration: 20-40 minutes

Metabolism: Active metabolite: 3-desacetyl vecuronium ($^{1}/_{2}$ the activity of parent drug)

Half-life elimination: 51-80 minutes

Excretion: Primarily feces (40% to 75%); urine (30% as unchanged drug and metabolites)

Related Information

- Neuromuscular-Blocking Agents

Pharmacotherapy PearlsVecuronium is classified as an intermediate-duration neuromuscular-blocking agent. It produces minimal, if any, histamine release; does not relieve pain or produce sedation. It may produce cumulative effect on duration of blockade.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health CommentPatients with myasthenia gravis and Eaton-Lambert syndrome have an increased sensitivity to vecuronium.

Anesthesia and Critical Care Concerns/Other ConsiderationsClassified as an intermediate duration neuromuscular-blocking agent; produces minimal, if any, histamine release.

Critically-Ill Adult Patients:

The 2008 Surviving Sepsis Campaign guidelines recommend avoiding use of neuromuscular blockers if at all possible in the septic patient due to the risk of prolonged neuromuscular blockade following discontinuation. If one is required, monitor the depth of blockade (Grade 1B).

The 2002 ACCM/SCCM/ASHP clinical practice guidelines for sustained neuromuscular blockade in the adult critically-ill patient recommend:

Optimize sedatives and analgesics prior to initiation and monitor and adjust accordingly during course. Neuromuscular blockers do not relieve pain or produce sedation.

Protect patient's eyes from development of keratitis and corneal abrasion by administering ophthalmic ointment and taping eyelids closed or using eye patches. Reposition patient routinely to protect pressure points from breakdown. Address DVT prophylaxis.

Concurrent use of a neuromuscular blocker and corticosteroids appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible. Reassess need for neuromuscular blocker daily.

Using daily drug holidays (stopping neuromuscular-blocking agent until patient requires it again) may decrease the incidence of acute quadriplegic myopathy syndrome.

Tachyphylaxis can develop; switch to another neuromuscular blocker (taking into consideration the patient's organ function) if paralysis is still necessary.

Atracurium or cisatracurium is recommended for patients with significant hepatic or renal disease, due to organ-independent Hofmann elimination.

Monitor patients clinically and via “Train of Four” (TOF) testing with a goal of adjusting the degree of blockade to 1-2 twitches or based upon the patient's clinical condition.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ven la FAX een)

U.S. Brand NamesEffexor XR®; Effexor®

Canadian Brand NamesCo-Venlafaxine XR; Effexor® XR; GEN-Venlafaxine XR; Novo-Venlafaxine XR; PMS-Venlafaxine XR; RATIO-Venlafaxine XR; RIVA-Venlafaxine XR; SANDOZ-Venlafaxine XR

Pharmacologic CategoryAntidepressant, Serotonin/Norepinephrine Reuptake Inhibitor

Use: Labeled IndicationsTreatment of major depressive disorder, generalized anxiety disorder (GAD), social anxiety disorder (social phobia), panic disorder

Use: Unlabeled/InvestigationalObsessive-compulsive disorder (OCD); hot flashes; neuropathic pain; attention-deficit/hyperactivity disorder (ADHD)

Dosing: Adults

Depression:

Immediate-release tablets: 75 mg/day, administered in 2 or 3 divided doses, taken with food; dose may be increased in 75 mg/day increments at intervals of at least 4 days, up to 225-375 mg/day

Extended-release capsules or tablets: 75 mg once daily taken with food; for some new patients, it may be desirable to start at 37.5 mg/day for 4-7 days before increasing to 75 mg once daily; dose may be increased by up to 75 mg/day increments every 4 days as tolerated, up to a recommended maximum of 225 mg/day

Generalized anxiety disorder: *Extended-release capsules:* 75 mg once daily taken with food; for some new patients, it may be desirable to start at 37.5 mg/day for 4-7 days before increasing to 75 mg once daily; dose may be increased by up to 75 mg/day increments every 4 days as tolerated, up to a maximum of 225 mg/day

Panic disorder:*Extended-release capsules:* 37.5 mg once daily for 1 week; may increase to 75 mg daily, with subsequent weekly increases of 75 mg/day up to a maximum of 225 mg/day.

Social anxiety disorder:

Extended-release capsules: 75 mg once daily taken with food; for some new patients, it may be desirable to start at 37.5 mg/day for 4-7 days before increasing to 75 mg once daily; dose may be increased by up to 75 mg/day increments every 4 days as tolerated, up to a maximum of 225 mg/day

Extended release tablets: 75 mg once daily taken with food (maximum: 75 mg/day); no evidence that doses >75 mg/day offer any additional benefit

Obsessive-compulsive disorder (unlabeled use): Titrate to usual dosage range of 150-300 mg/day; however, doses up to 375 mg daily have been used; response may be seen in 4 weeks

Neuropathic pain (unlabeled use): Dosages evaluated varied considerably based on etiology of chronic pain, but efficacy has been shown for many conditions in the range of 75-225 mg/day; onset of relief may occur in 1-2 weeks, or take up to 6 weeks for full benefit.

Hot flashes (unlabeled use): Doses of 37.5-75 mg/day have demonstrated significant improvement of vasomotor symptoms after 4-8 weeks of treatment; in one study, doses >75 mg/day offered no additional benefit; however, higher doses (225 mg/day) may be beneficial in patients with perimenopausal depression.

Attention-deficit disorder (unlabeled use): Initial: Doses vary between 18.75 to 75 mg/day; may increase after 4 weeks to 150 mg/day; if tolerated, doses up to 225 mg/day have been used

Note: When discontinuing this medication after more than 1 week of treatment, it is generally recommended that the dose be tapered. If venlafaxine is used for 6 weeks or longer, the dose should be tapered over 2 weeks when discontinuing its use.

Dosing: ElderlyRefer to adult dosing. No specific recommendations for elderly, but may be best to start lower at 25-50 mg twice daily and increase as tolerated by 25 mg/dose. Extended-release formulation: 37.5 mg once daily, increase by 37.5 mg every 4-7 days as tolerated

Alzheimer's dementia-related depression:

Immediate-release tablets: Initial: 25 mg/day; may increase at weekly intervals to maximum of 375 mg/day in divided doses

Extended-release capsules: Initial: 37.5 mg/day; may increase at weekly intervals to maximum of 225 mg/day

Dosing: Pediatric**Attention-deficit/hyperactivity disorder (unlabeled use):** Children and Adolescents: Oral: Initial: 12.5 mg/day

Children <40 kg: Increase by 12.5 mg/week to maximum of 50 mg/day in 2 divided doses

Children ≥40 kg: Increase by 25 mg/week to maximum of 75 mg/day in 3 divided doses.

Mean dose: 60 mg or 1.4 mg/kg administered in 2-3 divided doses

Dosing: Renal Impairment

Cl_{cr} 10-70 mL/minute: Decrease dose by 25%.

Hemodialysis: Decrease total daily dose by 50% given after completion of dialysis.

Dosing: Hepatic ImpairmentReduce total dosage by 50%.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister with food.

Extended release formulations: Swallow capsule or tablet whole; do not crush or chew. Contents of capsule may be sprinkled on a spoonful of applesauce and swallowed immediately without chewing; followed with a glass of water to ensure complete swallowing of the pellets.

Dietary ConsiderationsShould be taken with food.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to venlafaxine or any component of the formulation; use of MAO inhibitors within 14 days; should not initiate MAO inhibitor within 7 days of discontinuing venlafaxine

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor for clinical worsening, suicidality, or unusual changes in behavior; the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants in children and teenagers should be dispensed with each prescription. **Venlafaxine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Venlafaxine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anxiety/insomnia: May cause increase in anxiety, nervousness, and insomnia.

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin or NSAIDs due to ulcerogenic potential. Data are inconclusive regarding extent of bleeding risk of SNRIs in combination with warfarin or other anticoagulants. Bleeding related to SNRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- Hypercholesterolemia: May cause significant increases in serum total cholesterol.

- Hypertension: Dose-related increases in systolic and diastolic blood pressure have been documented. Monitor blood pressure regularly, and if sustained increases noted, consider dose reduction or discontinuation.

- Pulmonary events: Interstitial lung disease and eosinophilic pneumonia have been rarely reported. May present as progressive dyspnea, cough, and/or chest pain. Prompt evaluation and possible discontinuation of therapy may be necessary.

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

- Weight loss and anorectic effects: Dose-dependent weight loss has been observed in both pediatric and adult patients; weight loss was not limited to those experiencing reduced appetite.

Disease-related concerns:

- Cardiovascular disease: May cause sustained increase in blood pressure or tachycardia. Control pre-existing hypertension prior to initiation of venlafaxine. Use caution in patients with recent history of MI, unstable heart disease, or hyperthyroidism. Hypertensive effect is dose related and increases are generally modest (12-15 mm Hg diastolic).

- Hepatic impairment: Use caution; clearance is decreased and plasma concentrations are increased; dosage reduction recommended in patients with mild-to-moderate hepatic impairment.

- Narrow-angle glaucoma: May cause mydriasis; use caution in patients with increased intraocular pressure or at risk of acute narrow-angle glaucoma.

- Renal impairment: Use caution; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed; dosage reduction recommended in patients with renal impairment.

- Seizure disorders: Use caution with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Concurrent therapy with other drugs which lower the seizure threshold.

- Anticoagulants/antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.

- MAO inhibitors (MAO-Is): Potential for serotonin syndrome when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur. Concurrent use with MAO inhibitors is contraindicated. Do not begin venlafaxine within 14 days of terminating MAO-I therapy; do not initiate MAO-I treatment within 7 days of discontinuing venlafaxine.

- Proserotonergic drugs: Serotonin syndrome (eg, symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia) may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce venlafaxine's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

- Weight loss agents: Agents causing weight loss or anorectic effects should be avoided.

Special populations:

- Pediatrics: Small differences in height have been observed in pediatric patients receiving venlafaxine, particularly those <12 years of age, compared to placebo. Not FDA approved for use in children.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Withdrawal syndrome: Abrupt discontinuation or dosage reduction has been associated with a wide range of reactions, including (but not limited to) dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, impaired coordination/balance, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of venlafaxine therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsVenlafaxine's low anticholinergic activity, minimal sedation, and hypotension properties makes this a valuable antidepressant in treating elderly with depression or anxiety disorders. No dose adjustment is necessary for age alone; adjust dose for renal function in the elderly. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsVenlafaxine is classified as pregnancy category C due to adverse effects observed in animal studies. Venlafaxine and its active metabolite ODV cross the human placenta. Neonatal seizures and neonatal abstinence syndrome have been noted in case reports following maternal use of venlafaxine during pregnancy. Nonteratogenic effects in the newborn following SSRI/SNRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hyper- or hypotonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. The long-term effects on neurobehavior have not been studied.

Due to pregnancy-induced physiologic changes, some pharmacokinetic parameters of venlafaxine may be altered. Women should be monitored for decreased efficacy. Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/not recommended

Breast-Feeding Considerations Venlafaxine and ODV are found in human milk. Low concentrations of ODV have been found in the serum of nursing infants whose mothers are taking venlafaxine; venlafaxine has also been detected in some infants. Adverse events have not been observed; however, it is recommended to monitor the infant for adverse events if the decision to breast-feed has been made. The long-term effects on neurobehavior have not been studied, thus one should prescribe venlafaxine to a mother who is breast-feeding only when the benefits outweigh the potential risks. The manufacturer does not recommend breast-feeding during therapy.

Pregnancy & Lactation, In-Depth

- Venlafaxine in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Headache (25% to 38%), insomnia (15% to 24%), somnolence (12% to 23%), nervousness (6% to 21%), dizziness (11% to 20%)

Gastrointestinal: Nausea (21% to 58%), xerostomia (12% to 22%), anorexia (8% to 20%), constipation (8% to 15%)

Genitourinary: Abnormal ejaculation/orgasm (2% to 19%)

Neuromuscular & skeletal: Weakness (8% to 19%)

Miscellaneous: Diaphoresis (10% to 14%)

1% to 10%:

Cardiovascular: Hypertension (dose related; 3% in patients receiving <100 mg/day, up to 13% in patients receiving >300 mg/day), vasodilation (3% to 4%), palpitation (3%), tachycardia (2%), chest pain (2%), postural hypotension (1%), edema

Central nervous system: Abnormal dreams (3% to 7%), anxiety (5% to 6%), yawning (3% to 5%), agitation (2% to 4%), chills (3%), confusion (2%), abnormal thinking (2%), depersonalization (1%), depression (1% to 3%), fever, migraine, amnesia, hypoesthesia, trismus, vertigo

Dermatologic: Rash (3%), pruritus (1%), bruising

Endocrine & metabolic: Libido decreased (3% to 9%), hypercholesterolemia (5%), triglycerides increased

Gastrointestinal: Diarrhea (6% to 8%), dyspepsia (7%), vomiting (3% to 6%), abdominal pain (6%), flatulence (3% to 4%), taste perversion (2%), weight loss (1% to 4%), appetite increased, weight gain

Genitourinary: Impotence (4% to 10%), urinary frequency (3%), urination impaired (2%), urinary retention (1%), prostatic disorder

Neuromuscular & skeletal: Tremor (4% to 10%), hypertonia (3%), paresthesia (2% to 3%), twitching (1% to 3%), neck pain, arthralgia

Ocular: Abnormal or blurred vision (4% to 6%), mydriasis (2%)

Otic: Tinnitus (2%)

Respiratory: Pharyngitis (7%), sinusitis (2%), cough increased, dyspnea

Miscellaneous: Infection (6%), flu-like syndrome (6%), trauma (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Agranulocytosis, anaphylaxis, anemia, aplastic anemia, aneurysm, angina pectoris, anuria, appendicitis, arrhythmia (including atrial and ventricular tachycardia, fibrillation, and torsade de pointes), arteritis, asthma, ataxia, atelectasis, atrioventricular block, bacteremia, balance/coordination impaired, basophilia, bigeminy, biliary pain, bilirubinemia, bleeding time increased, bradycardia, bradykinesia, BUN increased, bundle branch block, carcinoma, cardiovascular disorder (mitral valve and circulatory disturbance), cataract, catatonia, cellulitis, cerebral ischemia, cholelithiasis, congestive heart failure, coronary artery disease, creatinine increased, crystalluria, cyanosis, deafness, DVT, dehydration, delusions, dementia, diabetes mellitus, dystonia, ECG abnormalities (including QT prolongation), embolus, eosinophilia, erythema multiforme, exfoliative dermatitis, extrapyramidal symptoms, extrasystoles, facial paralysis, fasciitis, fatty liver, gastrointestinal ulcer, glaucoma, glycosuria, granuloma, Guillain-Barré syndrome, heart arrest, hematemesis, hematoma, hemorrhage (eye, GI, mucocutaneous, rectal), hepatic necrosis, hepatic failure, hepatitis, homicidal ideation, hostility, hyperacusis, hypercalcinuria, hyperchlorhydria, hyper-/hypoglycemia, hyper-/hypokalemia, hyper-/hypophosphatemia, hyper-/hypothyroidism, hyperuricemia, hypocholesteremia, hyponatremia, hypoproteinemia, hypotension, interstitial lung disease (including eosinophilic pneumonia), intestinal obstruction, jaundice, kidney function abnormal, larynx edema, leukocytosis, leukoderma, leukopenia, liver enzymes increased, loss of consciousness, lymphadenopathy, lymphocytosis, maculopapular rash, menstrual abnormalities, miliaria, moniliasis, multiple myeloma, myasthenia, myocardial infarct, myoclonus, myopathy, neck rigidity, neuroleptic malignant-like syndrome, neuropathy, neutropenia, osteoporosis, pancreatitis, pancytopenia, peripheral vascular disorder, pleurisy, pneumonia, pyelonephritis, pyuria, renal failure, rhabdomyolysis, rheumatoid arthritis, seizure, serotonin syndrome, SIADH, skin atrophy, Stevens-Johnson syndrome, suicidal ideation (reported at a frequency up to 2% in children/adolescents with major depressive disorder), suicide attempt, syncope, tendon rupture, thrombocythemia, thrombocytopenia, tongue edema, toxic epidermal necrolysis, withdrawal syndrome

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP2B6 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Serotonin/Norepinephrine Reuptake Inhibitors may enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Serotonin/Norepinephrine Reuptake Inhibitors may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk C: Monitor therapy*

Aspirin: Serotonin/Norepinephrine Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Indinavir: Venlafaxine may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iobenguane I 123: Serotonin/Norepinephrine Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Metoclopramide: May enhance the adverse/toxic effect of Venlafaxine. Specifically, the risk of serotonin syndrome may be increased. *Risk C: Monitor therapy*

NSAID (Nonselective): Serotonin/Norepinephrine Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

TraZODone: Venlafaxine may enhance the serotonergic effect of TraZODone. This could result in serotonin syndrome. *Risk D: Consider therapy modification*

Voriconazole: May enhance the adverse/toxic effect of Venlafaxine. Voriconazole may increase the serum concentration of Venlafaxine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS effects).

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava, tryptophan (may increase risk of serotonin syndrome and/or excessive sedation).

Test InteractionsIncreased thyroid, uric acid, glucose, potassium, AST, cholesterol (S)

Monitoring ParametersBlood pressure should be regularly monitored, especially in patients with a high baseline blood pressure; may cause mean increase in heart rate of 4-9 beats/minute; cholesterol; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; height and weight should be monitored in children

Reference RangePeak serum level of 163 ng/mL (325 ng/mL of ODV metabolite) obtained after a 150 mg oral dose

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness according to rationale for therapy and adverse reactions at beginning of therapy and periodically with long-term use. Observe for clinical worsening, suicidality, or unusual behavior changes; especially during the initial few months of therapy or during dosage changes. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCholesterol

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Take with food. Extended release capsules should be swallowed whole; do not crush or chew. Alternatively, contents may be emptied onto a spoonful of applesauce and swallowed without chewing. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness or insomnia, lightheadedness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); headache, nausea, vomiting, anorexia, altered taste, dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); urinary retention (void before taking medication); or sexual dysfunction (reversible). Report persistent CNS effects (eg, insomnia, restlessness, fatigue, anxiety, abnormal thoughts, suicidal ideation, confusion, personality changes, impaired cognitive function); muscle cramping or tremors; chest pain, palpitations, rapid heartbeat, swelling of extremities, or severe dizziness; unresolved urinary retention; vision changes or eye pain; hearing changes or ringing in ears; skin rash or irritation; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

Effexor XR®: 37.5 mg, 75 mg, 150 mg

Tablet: 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg

Effexor®: 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg

Tablet, extended release: 37.5 mg, 75 mg, 150 mg, 225 mg

Generic AvailableYes: Excludes extended release capsule

ManufacturerWyeth-Ayerst Laboratories

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Effexor XR)

37.5 mg (30): $109.99

75 mg (90): $345.99

150 mg (30): $129.99

Tablets (Effexor)

25 mg (30): $69.99

37.5 mg (30): $75.99

50 mg (90): $197.86

75 mg (30): $79.99

100 mg (30): $80.99

Tablets (Venlafaxine HCl)

25 mg (30): $52.99

37.5 mg (30): $53.99

50 mg (100): $189.98

75 mg (30): $59.99

100 mg (100): $190.99

Mechanism of ActionVenlafaxine and its active metabolite, o-desmethylvenlafaxine (ODV), are potent inhibitors of neuronal serotonin and norepinephrine reuptake and weak inhibitors of dopamine reuptake. Venlafaxine and ODV have no significant activity for muscarinic cholinergic, H_1-histaminergic, or alpha$_2$-adrenergic receptors. Venlafaxine and ODV do not possess MAO-inhibitory activity.

Pharmacodynamics/Kinetics

Absorption: Oral: 92% to 100%; food has no significant effect on the absorption of venlafaxine or formation of the active metabolite O-desmethylvenlafaxine (ODV)

Distribution: At steady state: Venlafaxine 7.5 ± 3.7 L/kg, ODV 5.7 ± 1.8 L/Kg

Protein binding: Bound to human plasma protein: Venlafaxine 27%, ODV 30%

Metabolism: Hepatic via CYP2D6 to active metabolite, O-desmethylvenlafaxine (ODV); other metabolites include N-desmethylvenlafaxine and N,O-didesmethylvenlafaxine

Bioavailability: Absolute: ~45%

Half-life elimination: Venlafaxine: 3-7 hours; ODV: 9-13 hours; Steady-state, plasma: Venlafaxine/ODV: Within 3 days of multiple-dose therapy; prolonged with cirrhosis (Adults: Venlafaxine: ~30%, ODV: ~60%) and with dialysis (Adults: Venlafaxine: ~180%, ODV: ~142%)

Time to peak:

Immediate release: Venlafaxine: 2 hours, ODV: 3 hours

Extended release: Venlafaxine: 5.5 hours, ODV: 9 hours

Excretion: Urine (~87%, 5% as unchanged drug, 29% as unconjugated ODV, 26% as conjugated ODV, 27% as minor inactive metabolites) within 48 hours

Clearance at steady state: Venlafaxine: 1.3 ± 0.6 L/hour/kg, ODV: 0.4 ± 0.2 L/hour/kg

Clearance decreased with:

Cirrhosis: Adults: Venlafaxine: ~50%, ODV: ~30%

Severe cirrhosis: Adults: Venlafaxine: ~90%

Renal impairment (Cl_{cr} 10-70 mL/minute): Adults: Venlafaxine: ~24%

Dialysis: Adults: Venlafaxine: ~57%, ODV: ~56%; due to large volume of distribution, a significant amount of drug is not likely to be removed.

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation); may contribute to oral discomfort, especially in the elderly; taste perversion

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough venlafaxine is not a tricyclic antidepressant, it does block norepinephrine reuptake within CNS synapses as part of its mechanisms. It has been suggested that vasoconstrictor be administered with caution and to monitor vital signs in dental patients taking antidepressants that affect norepinephrine in this way. This is particularly important in patients taking venlafaxine, which has been noted to produce a sustained increase in diastolic blood pressure and heart rate as a side effect.

Mental Health: Child/Adolescent ConsiderationsSixteen children and adolescents (mean age: 11.6 years) with attention-deficit/hyperactivity disorder (ADHD) received a mean daily dose of 60 mg (1.4 mg/kg) administered in 2-3 divided doses (Olvera, 1996). Thirty-three children 8-17 years of age with major depression participated in a 6-week trial. For children 8-12 years, doses were initiated at 12.5 mg once daily for 3 days, then increased to 12.5 mg twice daily for 3 days, then increased to 12.5 mg 3 times/day for the rest of the study. Both venlafaxine and placebo patients improved over time, however, no significant differences in symptoms were noted between groups (Mandoki, 1997). Higher initial doses of 37.5 mg/day for 1 week with increases to 75 mg/day for 2-8 weeks are currently being investigated (Weller, 2000). Ten children with autism spectrum disorder were initiated at 12.5 mg/day and adjusted on a flexible basis (mean: 24.4 mg/day; range 6.25-50 mg/day) (Hollander, 2000).

Mental Health CommentVenlafaxine functions like an SSRI in low doses (75 mg/day), a dual mechanism agent in moderate doses (150-225 mg/day) and affects serotonin, norepinephrine, and dopamine in high doses (375 mg/day). May cause modest dose related increases in systolic blood pressure; monitor blood pressure.

Medication Safety Issues

Sound-alike/look-alike issues:

Calan® may be confused with Colace®

Covera-HS® may be confused with Provera®

Isoptin® may be confused with Isopto® Tears

Verelan® may be confused with Virilon®, Voltaren®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

International issues:

Calan®: Brand name for vinpocetine in Japan

Pronunciation(ver AP a mil)

U.S. Brand NamesCalan®; Calan® SR; Covera-HS®; Isoptin® SR; Verelan®; Verelan® PM

Canadian Brand NamesApo-Verap®; Apo-Verap® SR; Calan®; Chronovera®; Covera-HS®; Covera®; Dom-Verapamil SR; Gen-Verapamil; Gen-Verapamil SR; Isoptin® SR; Med-Verapamil; Novo-Veramil SR; Nu-Verap; PHL-Verapamil; PMS-Verapamil SR; PRO-Verapamil SR; Riva-Verapamil SR; Verapamil Hydrochloride Injection, USP; Verelan SRC

Pharmacologic CategoryAntiarrhythmic Agent, Class IV; Calcium Channel Blocker

Use: Labeled IndicationsOrally for treatment of angina pectoris (vasospastic, chronic stable, unstable) and hypertension; I.V. for supraventricular tachyarrhythmias (PSVT, atrial fibrillation, atrial flutter)

Use: Unlabeled/InvestigationalMigraine; hypertrophic cardiomyopathy; bipolar disorder (manic manifestations)

Dosing: Adults

Angina: Oral: Initial: 80-120 mg twice daily (elderly or small stature: 40 mg twice daily); range: 240-480 mg/day in 3-4 divided doses

Hypertension: Oral:

Immediate release: 80 mg 3 times/day; usual dose range (JNC 7): 80-320 mg/day in 2 divided doses

Sustained release: 240 mg/day; usual dose range (JNC 7): 120-360 mg/day in 1-2 divided doses; 120 mg/day in the elderly or small patients (no evidence of additional benefit in doses >360 mg/day).

Extended release:

Covera-HS®: Usual dose range (JNC 7): 120-360 mg once daily (once-daily dosing is recommended at bedtime)

Verelan® PM: Usual dose range: 200-400 mg once daily at bedtime

Arrhythmia (SVT): I.V.: 2.5-5 mg (over 2 minutes); second dose of 5-10 mg (~0.15 mg/kg) may be given 15-30 minutes after the initial dose if patient tolerates, but does not respond to initial dose; maximum total dose: 20 mg

Dosing: Elderly

Immediate release: Oral: 120-480 mg/24 hours divided 3-4 times/day

Sustained release: Oral: 120 mg/day; adjust dose after 24 hours by increases of 120 mg/day. When switching from immediate release forms, total daily dose may remain the same. Controlled onset: initiate therapy with 180 mg in the evening; titrate upward as needed to obtain desired response and avoiding adverse effects.

Dosing: PediatricChildren: **SVT:**

I.V.:

<1 year: 0.1-0.2 mg/kg over 2 minutes; repeat every 30 minutes as needed

1-15 years: 0.1-0.3 mg/kg over 2 minutes; maximum: 5 mg/dose, may repeat dose in 15 minutes if adequate response not achieved; maximum for second dose: 10 mg/dose

Oral (dose not well established):

1-5 years: 4-8 mg/kg/day in 3 divided doses **or** 40-80 mg every 8 hours

>5 years: 80 mg every 6-8 hours

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Administer 50% to 75% of normal dose.

Dosing: Hepatic ImpairmentIn cirrhosis, reduce dose to 20% to 50% of normal and monitor ECG.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Rate of infusion: Over 2 minutes

Administration: I.V. DetailpH: 4.1-6.0

Administration: OralDo not crush or chew sustained or extended release products.

Calan® SR, Isoptin® SR: Administer with food.

Verelan®, Verelan® PM: Capsules may be opened and the contents sprinkled on 1 tablespoonful of applesauce, then swallowed without chewing.

Dietary ConsiderationsCalan® SR and Isoptin® SR products may be taken with food or milk, other formulations may be administered without regard to meals; sprinkling contents of Verelan® or Verelan® PM capsule onto applesauce does not affect oral absorption.

StorageStore injection at room temperature; do not freeze. Protect from heat. Use only clear solutions. Protect I.V. solution from light. Physically compatible in solutions of pH of 3-6, but may precipitate in solutions having a pH ≥6. Protect I.V. solution from light.

CompatibilityStable in dextran 40 10% in NS, dextran 75 6% in NS, D_5LR, $D_5{}^1/_2NS$, D_5NS, D_5W, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Ciprofloxacin, clarithromycin, dobutamine, dopamine, famotidine, gatifloxacin, hydralazine, inamrinone, linezolid, meperidine, milrinone, penicillin G potassium, piperacillin, ticarcillin. **Incompatible:** Albumin, amphotericin B cholesteryl sulfate complex, ampicillin, nafcillin, oxacillin, propofol, sodium bicarbonate.

Compatibility in syringe: Compatible: Heparin, inamrinone, milrinone.

Compatibility when admixed: Compatible: Amikacin, amiodarone, ascorbic acid, atropine, bretylium, calcium chloride, calcium gluconate, cefamandole, cefazolin, cefotaxime, cefoxitin, chloramphenicol, cimetidine, clindamycin, dexamethasone sodium phosphate, diazepam, digoxin, dopamine, epinephrine, erythromycin lactobionate, gentamicin, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, insulin (regular), isoproterenol, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methyldopate, methylprednisolone sodium succinate, metoclopramide, morphine, multivitamins, naloxone, nitroglycerin, norepinephrine, oxytocin, pancuronium, penicillin G potassium, penicillin G sodium, pentobarbital, phenobarbital, phentolamine, phenytoin, piperacillin, potassium chloride, potassium phosphates, procainamide, propranolol, protamine, quinidine gluconate, sodium bicarbonate, sodium nitroprusside, theophylline, ticarcillin, tobramycin, tolazoline, vancomycin, vasopressin, vitamin B complex with C. **Incompatible:** Albumin, amphotericin B, floxacillin, hydralazine, trimethoprim/sulfamethoxazole. **Variable (consult detailed reference):** Aminophylline, ampicillin, dobutamine, furosemide, nafcillin, oxacillin.

Extemporaneously PreparedTo prepare a verapamil 50 mg/mL liquid, crush 75 verapamil hydrochloride 80 mg tablets into a fine powder. Add ~40 mL of either Ora-Sweet® and Ora-Plus® (1:1 preparation), or Ora-Sweet® SF and Ora-Plus® (1:1 preparation), or cherry syrup. Mix to a uniform paste. Continue to add the vehicle to bring the final volume to 120 mL. The preparation is stable for 60 days; shake well before using and protect from light.

Allen LV and Erickson III MA, “Stability of Labetalol Hydrochloride, Metoprolol Tartrate, Verapamil Hydrochloride, and Spironolactone With Hydrochlorothiazide in Extemporaneously Compounded Oral Liquids,” *Am J Health Syst Pharm*, 1996, 53:304-9.

ContraindicationsHypersensitivity to verapamil or any component of the formulation; severe left ventricular dysfunction; hypotension (systolic pressure <90 mm Hg) or cardiogenic shock; sick sinus syndrome (except in patients with a functioning artificial pacemaker); second- or third-degree AV block (except in patients with a functioning artificial pacemaker); atrial flutter or fibrillation and an accessory bypass tract (WPW, Lown-Ganong-Levine syndrome)

Allergy Considerations

- Verapamil Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.

- Conduction abnormalities: Can cause first-degree AV block or sinus bradycardia; other conduction abnormalities are rare.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.

- Increased LFTs: Rare increases in liver function tests can be observed.

- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.

Disease-related concerns:

- Attenuated neuromuscular transmission: Use I.V. with caution in patients with attenuated neuromuscular transmission (Duchenne's muscular dystrophy, myasthenia gravis).

- Heart failure: Avoid use in heart failure; can exacerbate condition.

- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.

- Idiopathic hypertrophic subaortic stenosis (IHSS): Use with caution in patients with IHSS.

- Renal impairment: Adjust the dose in severe renal impairment.

Concurrent drug therapy issues:

- Beta-blockers: Use caution when using verapamil together with a beta-blocker; avoid concurrent use of I.V. verapamil with an I.V. beta-blocker; can result in asystole.

- Digoxin: Verapamil significantly increases digoxin serum concentrations; adjust digoxin's dose.

- Neuromuscular-blocking agents: May prolong recovery from nondepolarizing neuromuscular-blocking agents.

Geriatric ConsiderationsElderly may experience a greater hypotensive response. Constipation may be more of a problem in the elderly. Calcium channel blockers are no more effective in the elderly than other therapies; however, they do not cause significant CNS effects which is an advantage over some antihypertensive agents. Generic verapamil products which are bioequivalent in young adults may not be bioequivalent in the elderly; use generics cautiously.

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse in pregnancy only when clearly needed and when the benefits outweigh the potential risk to the fetus. Crosses the placenta. One report of suspected heart block when used to control fetal supraventricular tachycardia. May exhibit tocolytic effects.

LactationEnters breast milk (small amounts)/not recommended

Breast-Feeding ConsiderationsCrosses into breast milk; manufacturer recommends to discontinue breast-feeding while taking verapamil. AAP considers **compatible** with breast-feeding.

Adverse Reactions

>10%: Gastrointestinal: Gingival hyperplasia (19%)

1% to 10%:

Cardiovascular: Bradycardia (1.4% oral, 1.2% I.V.); first-, second-, or third-degree AV block (1.2% oral, unknown I.V.); CHF (1.8% oral); hypotension (2.5% oral, 3% I.V.); peripheral edema (1.9% oral); symptomatic hypotension (1.5% I.V.); severe tachycardia (1% I.V.)

Central nervous system: Dizziness (3.3% oral, 1.2% I.V.), fatigue (1.7% oral), headache (2.2% oral, 1.2% I.V.)

Dermatologic: Rash (1.2% oral)

Gastrointestinal: Constipation (12% up to 42% in clinical trials), nausea (2.7% oral, 0.9% I.V.)

Respiratory: Dyspnea (1.4% oral)

Oral: <1% (Limited to important or life-threatening): Angina, atrioventricular dissociation, chest pain, claudication, MI, palpitation, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis, bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia, rash, exanthema, hair loss, hyperkeratosis, macules, diaphoresis, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, tinnitus, gynecomastia, galactorrhea/hyperprolactinemia, urination increased, spotty menstruation, impotence, flushing, abdominal discomfort

I.V.: <1% (Limited to important or life-threatening): Bronchi/laryngeal spasm, itching, urticaria, emotional depression, rotary nystagmus, sleepiness, vertigo, muscle fatigue, diaphoresis, respiratory failure, myoclonus

Postmarketing and/or case reports: Stevens-Johnson syndrome, erythema multiforme, exfoliative dermatitis, EPS, gynecomastia, eosinophilia, ventricular fibrillation, asystole, electrical mechanical dissociation, shock, myoclonus, Parkinsonian syndrome, GI obstruction, pulmonary edema, respiratory failure, hair color change

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2B6 (minor), 2C9 (minor), 2C18 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2D6 (weak), 3A4 (moderate)

Drug Interactions

Alcohol (Ethyl): Verapamil may increase the serum concentration of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: Calcium Channel Blockers (Nondihydropyridine) may enhance the bradycardic effect of Amiodarone. Sinus arrest has been reported. *Risk D: Consider therapy modification*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of

Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Beta-Blockers: Calcium Channel Blockers (Nondihydropyridine) may enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

BusPIRone: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Calcium Channel Blockers (Nondihydropyridine) may enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of CarBAMazepine. CarBAMazepine may increase the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

Cardiac Glycosides: Calcium Channel Blockers (Nondihydropyridine) may enhance the AV-blocking effect of Cardiac Glycosides. Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Colchicine: Verapamil may enhance the nephrotoxic effect of Colchicine. Colchicine may increase the serum concentration of Verapamil. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of CycloSPORINE. CycloSPORINE may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dofetilide: Verapamil may increase the serum concentration of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Eletriptan. *Risk C: Monitor therapy*

Eplerenone: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Fexofenadine: Verapamil may increase the bioavailability of Fexofenadine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Lithium: Calcium Channel Blockers (Nondihydropyridine) may enhance the neurotoxic effect of Lithium. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Lithium. Decreased or unaltered lithium concentrations have also been reported with this combination. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Calcium Channel Blockers (Nondihydropyridine) may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of QuiNIDine. *Risk D: Consider therapy modification*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Ranolazine: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

Risperidone: Verapamil may increase the serum concentration of Risperidone. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salicylates: Calcium Channel Blockers (Nondihydropyridine) may enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Tacrolimus. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase ethanol levels).

Food: Grapefruit juice may increase the serum concentration of verapamil; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease levels. Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen arrhythmia or hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersMonitor blood pressure closely

Reference RangeTherapeutic: 50-200 ng/mL (SI: 100-410 nmol/L) for parent; under normal conditions, norverapamil concentration is the same as parent drug. Toxic: >90 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. I.V. requires use of infusion pump and continuous cardiac and hemodynamic monitoring. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions when beginning therapy, when titrating dosage, and periodically during long-term oral therapy. Assess knowledge/teach patient appropriate use (oral), interventions to reduce side effects, and adverse symptoms to report.

Patient Education**Oral:** Take as directed. Do not alter dosage or discontinue therapy without consulting prescriber. Do not crush or chew sustained or extended release forms. Avoid grapefruit juice; avoid (or limit) alcohol and caffeine. You may experience dizziness or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report chest pain, palpitations, or irregular heartbeat; unusual cough, respiratory difficulty, or swelling of extremities (feet/ankles); muscle tremors or weakness; confusion or acute lethargy; or skin irritation or rash. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, sustained release, as hydrochloride: 120 mg, 180 mg, 240 mg

Mechanism of ActionInhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization; produces a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina; slows automaticity and conduction of AV node.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Oral: Immediate release: 1-2 hours; I.V.: 1-5 minutes

Duration: Oral: Immediate release tablets: 6-8 hours; I.V.: 10-20 minutes

Protein binding: 90%

Metabolism: Hepatic via multiple CYP isoenzymes; extensive first-pass effect

Bioavailability: Oral: 20% to 35%

Half-life elimination: Infants: 4.4-6.9 hours; Adults: Single dose: 2-8 hours, Multiple doses: 4.5-12 hours; prolonged with hepatic cirrhosis

Excretion: Urine (70%, 3% to 4% as unchanged drug); feces (16%)

- Hypertension

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Gingival hyperplasia. Calcium channel blockers (CCB) have been reported to cause gingival hyperplasia (GH). Verapamil-induced GH has appeared 11 months or more after subjects took daily doses of 240-360 mg. The severity of hyperplastic syndrome does not seem to be dose dependent. Gingivectomy is only successful if CCB therapy is discontinued. GH regresses markedly 1 week after CCB discontinuance with all symptoms resolving in 2 months. If a patient must continue CCB therapy, begin a program of professional cleaning and patient plaque control to minimize severity and growth rate of gingival tissue.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, confusion, insomnia, psychotic symptoms, and extrapyramidal symptoms

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease verapamil serum concentrations; verapamil may increase buspirone, carbamazepine, and midazolam serum concentrations; concurrent use with lithium may cause an increase or decrease in serum lithium concentrations; monitor; verapamil has been used to treat bipolar disorder, mania

Cardiovascular ConsiderationsVerapamil is an effective antihypertensive alone or in combination with other agents. Therapy should be individualized with consideration given to the patient's concomitant diseases and compelling indications for therapy. A verapamil preparation (Covera® HS, Verelan® PM) uses a chronotherapeutic approach to the treatment of hypertension and angina. This drug preparation provides peak drug effects in the early morning when the circadian distribution of cardiovascular events is also at a peak. The benefit of this theoretical approach to treatment has not been established. The CONVINCE trial is currently underway to address this issue.

There is some evidence that verapamil may reduce mortality in nonfatal cardiac events, primarily myocardial infarction, in patients with history of myocardial infarction (DAVIT-II). It is important to note that this benefit was observed in patients with coronary artery disease without heart failure.

In the treatment of acute myocardial infarction, verapamil may be used to treat hypertension or ongoing ischemia if beta-blocker therapy is ineffective or contraindicated and in the absence of left ventricular dysfunction, pulmonary congestion, or AV block. In this setting, verapamil may be beneficial. Verapamil should be avoided in patients with left ventricular dysfunction or pulmonary congestion.

Verapamil may be administered intravenously in the acute setting to attain ventricular rate control in patients with atrial fibrillation or flutter. Patients who respond, defined in general as at least a 20% decrease in ventricular response rate or attaining a rate <100 beats/minute, can be continued on oral therapy to maintain control. It is important to consider the potential drug interaction with digoxin, as these agents are both used in this setting.

In the treatment of unstable angina/non-ST-segment elevation MI, a nondihydropyridine calcium antagonist (diltiazem or verapamil) may be considered in patients with continuing or frequently recurring ischemia when beta-blockers are contraindicated (Class I). Oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates (Class IIa).

Anesthesia and Critical Care Concerns/Other ConsiderationsI.V. administration, hypertrophic cardiomyopathy, sick sinus syndrome, moderate-to-severe congestive heart failure, concomitant therapy with beta-blockers or digoxin can all increase incidence of adverse effects. Verapamil should be avoided in patients with left ventricular dysfunction, pulmonary congestion, or heart failure. Verapamil may be administered intravenously in the acute setting to attain ventricular rate control in patients with atrial fibrillation or flutter. Patients who respond, defined in general as at least a 20% decrease in ventricular response rate or attaining a rate <100 beats/minute, can be continued on oral therapy to maintain control. It is important to consider the potential drug interaction with digoxin, as these agents are both used in this setting.

Extemporaneously Prepared: To prepare a verapamil 50 mg/mL liquid, crush 75 verapamil hydrochloride 80 mg tablets into a fine powder. Add ~ 40 mL of either Ora-Sweet® and Ora-Plus® (1:1 preparation), or Ora-Sweet® SF and Ora-Plus® (1:1 preparation), or cherry syrup. Mix to a uniform paste. Continue to add the vehicle to bring the final volume to 120 mL. The preparation is stable for 60 days; shake well before using and protect from light.

Index TermsIproveratril Hydrochloride; Verapamil Hydrochloride

Verteporfin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ver te POR fin)
U.S. Brand NamesVisudyne®
Canadian Brand NamesVisudyne®
Pharmacologic CategoryOphthalmic Agent
Use: Labeled IndicationsTreatment of predominantly classic subfoveal choroidal neovascularization due to macular degeneration, presumed ocular histoplasmosis, or pathologic myopia
Use: Unlabeled/InvestigationalPredominantly **occult** subfoveal choroidal neovascularization
Dosing: AdultsTherapy is a two-step process; first the infusion of verteporfin, then the activation of verteporfin with a nonthermal diode laser (for light administration details, see Administration).

Subfoveal choroidal neovascularization: I.V.: 6 mg/m^2 body surface area

Note: Treatment in more than one eye: Patients who have lesions in both eyes should be evaluated and treatment should first be done to the more aggressive lesion. Following safe and acceptable treatment, the second eye can be treated one week later. Patients who have had previous verteporfin therapy, with an acceptable safety profile, may then have both eyes treated concurrently. Treat the more aggressive lesion followed immediately with the second eye. The light treatment to the second eye should begin no later than 20 minutes from the start of the infusion.

Dosing: ElderlyRefer to adult dosing. Patients ≥75 years were less likely to benefit from therapy in clinical trials.
Dosing: Hepatic ImpairmentHalf-life is increased by 20% with mild hepatic impairment. There are no clinical studies in patients with moderate-to-severe hepatic impairment.
Calculations

- Body Surface Area: Adults

Administration: I.V.A free-flowing I.V. line should be established prior to starting infusion. Use of the largest arm vein, especially in the elderly, is suggested; avoid small veins in the back of the hand. Reconstituted solution should be given at 3 mL/minute over 10 minutes using a syringe pump and an in-line filter. If extravasation occurs (see Extravasation management), protect the site from light. Use of rubber gloves and eye protection is recommended. Skin and eye contact should be avoided and all materials should be disposed of properly.

Light administration: Following intravenous infusion, verteporfin must be light activated using a nonthermal diode laser. The system must provide a stable power output at a wavelength of 689 ± 3 nm. Approved laser systems are listed in manufacturer's package insert. Light delivery should begin 15 minutes following the start of the 10-minute infusion. The light dose is J/cm^2 of neovascular lesion administered over 83 seconds at an intensity of 600 mW/cm^2. Instructions for determining lesion size and treatment spot size can also be found in the package insert.

Administration: I.V. DetailExtravasation management: Stop infusion. To decrease the chance of a severe burn, protect the area of extravasation from direct light until swelling and discoloration have faded. Apply cold compresses to the injection site.
StorageStore vial at 20°C to 25°C (68°F to 77°F).
ReconstitutionEach vial should be reconstituted with 7 mL of sterile water for injection, providing a total volume of 7.5 mL. Resulting solution will be 2 mg/mL. Solution should be protected from light and used within 4 hours. Once reconstituted, verteporfin will be an opaque dark green solution. The total volume of solution needed to administer the dose should be withdrawn from the vial and further diluted in D_5W to a total volume of 30 mL. Infuse at 3 mL/minute over 10 minutes, using syringe pump and in-line filter.
ContraindicationsHypersensitivity to verteporfin or any component of the formulation; porphyria
Warnings/Precautions

Concerns related to adverse effects:

- Infusion reactions: Chest pain, vasovagal and hypersensitivity reactions have occurred rarely; observation of patient during infusion is suggested.
- Photosensitivity: Avoid exposing skin or eyes to direct sunlight or bright indoor light for 5 days following treatment; in case of emergency surgery within 48 hours of treatment, protect as much of the internal tissue as possible from intense light.

Disease-related concerns:

- Biliary obstruction: Use with caution in patients with biliary obstruction; not studied.
- Hepatic impairment: Use with caution in patients with moderate-to-severe hepatic impairment; not studied.

Concurrent drug therapy issues:

- Anesthesia: Use with caution in patients under anesthesia; not studied.

Special populations:

- Elderly: Patients ≥75 years of age are less likely to benefit from therapy.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Do not retreat patients who experience a decrease of vision ≥4 lines within 1 week of treatment unless vision recovers and the potential benefits and risks are carefully considered. Use of incompatible lasers (which do not provide the required light for photoactivation) can result in incomplete treatment, overtreatment, or damage to normal tissue. Patients with dark irides, occult lesions, or <50% classic choroidal neovascularization are less likely to benefit from therapy.

- Concurrent administration in both eyes: Use in more than one eye has not been studied; however, it is recommended that if required, initial treatment should be applied to the more aggressive lesion first, followed by the second eye a week later (subsequent treatment may be concurrent).

- Extravasation: Standard precautions should be taken to avoid extravasation (eg free-flowing I.V. line, use of largest arm vein).

- Long-term use: Safety and efficacy have not been established of use for longer than 2 years.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use only if the potential benefit to the mother outweighs the potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsVerteporfin and its metabolite were in the breast milk of one woman; milk levels were 66% of plasma levels following infusion; the metabolite was still detected 48 hours later. The manufacturer recommends that nursing be discontinued or treatment be postponed.

Adverse Reactions

>10%:

Central nervous system: Headache

Local: Injection site reactions (including injection site extravasation, injection site rash)

Ocular: Blurred vision, visual acuity decreased, visual field defects, visual disturbances

1% to 10%:

Cardiovascular: Atrial fibrillation, hypertension, peripheral vascular disorder, varicose veins

Central nervous system: Fever, hypoesthesia, sleep disturbance, vertigo

Dermatologic: Eczema, photosensitivity

Gastrointestinal: Constipation, gastrointestinal cancers, nausea

Genitourinary: Prostatic disorder

Hematologic: Anemia, leukocytosis, leukopenia

Hepatic: Liver function tests increased

Neuromuscular & skeletal: Arthralgia, arthrosis, back pain (primarily during infusion), myasthenia, weakness

Ocular: Diplopia, lacrimation disorder

Treatment site: Blepharitis, cataracts, conjunctivitis/conjunctival injection, dry eyes, ocular itching, severe vision loss (1% to 4%, decrease in 4 lines or more within 7 days of treatment, partial recovery seen in many patients), subconjunctival, subretinal or vitreous hemorrhage.

Otic: Hearing loss

Renal: Albuminuria, creatinine increased

Respiratory: Cough, pharyngitis, pneumonia

Miscellaneous: Flu-like syndrome

Frequency not defined or <1%: Chest pain, hypersensitivity, musculoskeletal pain (during infusion), retinal detachment (nonrhegmatogenous), retinal or choroidal vessel nonperfusion, vasovagal reaction

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsEthanol: Ethanol may decrease efficacy of verteporfin.

Monitoring ParametersIntravenous site during infusion, to avoid extravasation; fluorescein angiography every 3 months to monitor choroidal neovascular leakage

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 15 mg [contains egg phosphatidylglycerol]

Generic AvailableNo

Mechanism of ActionFollowing intravenous administration, verteporfin is transported by lipoproteins to the neovascular endothelium in the affected eye(s), including choroidal neovasculature and the retina. Verteporfin then needs to be activated by nonthermal red light, which results in local damage to the endothelium, leading to temporary choroidal vessel occlusion.

Pharmacodynamics/Kinetics

Metabolism: Hepatic and by plasma esterases to diacid metabolite

Half-life elimination: Terminal: 5-6 hours, biexponential

Excretion: Feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health CommentMay cause photosensitivity; concomitant use with psychotropic agents may produce additive risk.

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Pronunciation(vye GA ba trin)

Canadian Brand NamesSabril®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsActive management of partial or secondary generalized seizures not controlled by usual treatments; treatment of infantile spasms

Use: Unlabeled/InvestigationalSpasticity, tardive dyskinesias

Dosing: Adults**Adjunctive therapy of seizures:** Oral: Initial: 1 g/day (severe manifestations may require 2 g/day); dose may be given as a single daily dose or divided into 2 equal doses. Increase daily dose by 0.5 g based on response and tolerability. Optimal dose range: 2-3 g/day (maximum dose: 3 g/day).

Dosing: ElderlyRefer to adult dosing. Initiate at low end of dosage range. Monitor closely for sedation and confusion.

Dosing: Pediatric**Note:** Administer daily dose in 2 divided doses, especially in the higher dosage ranges:

Adjunctive therapy of seizures: Oral: Initial: 40 mg/kg/day; maintenance dosages based on patient weight:

10-15 kg: 0.5-1 g/day

16-30 kg: 1-1.5 g/day

31-50 kg: 1.5-3 g/day

>50 kg: 2-3 g/day

Infantile spasms: Oral: 50-100 mg/kg/day, depending on severity of symptoms. Higher doses (up to 150 mg/kg/day) have been used in some cases.

Dosing: Renal ImpairmentCl_{cr} <60 mL/minute: Initiate at lower dosage; monitor closely for sedation and confusion

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered with or without food.

Sachet: Dissolve powder in 10 mL of water, juice, infant formula, or milk immediately before administration. The appropriate aliquot may be administered using an oral syringe.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 15°C to 30°C (68°F to 86°F). Protect from moisture.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to vigabatrin of any component of the formulation; pregnancy or breast-feeding

Allergy Considerations

- Vigabatrin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Neurotoxicity: Patients must be closely monitored for potential neurotoxicity (observed in animal models but not established in humans).

- Visual disturbances: May be associated with ophthalmologic toxicities, which may be permanent; baseline and periodic monitoring is required. Patients must be instructed to report changes in vision.

Disease-related concerns:

- Psychiatric behavior: Use with caution in patients with a history of psychosis (psychotic/agitated reactions may occur more frequently), depression, or behavioral problems.

- Renal impairment: Use with caution in patients with renal impairment (Cl_{cr} <60 mL/minute).

- Seizures: May cause an increase in seizure frequency in some patients; use with particular caution in patients with myoclonic seizures, which may be more prone to this effect.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Pregnancy Risk FactorNot assigned; contraindicated per manufacturer

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Animal studies indicating fetal malformation and neurotoxicity are of concern.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

>10%:

Central nervous system: Fatigue (27%), headache (26%), drowsiness (22%), dizziness (19%), depression (13%), tremor (11%), agitation (11%). **Note:** In pediatric use, hyperactivity (hyperkinesia, agitation, excitation, or restlessness) was reported in 11% of patients.

Endocrine & metabolic: Weight gain (12%)

Ocular: Visual field defects (33%), abnormal vision (11%)

1% to 10%:

Cardiovascular: Chest pain, edema (dependent)

Central nervous system: Abnormal thinking, aggression, amnesia, anxiety, ataxia, concentration impaired, confusion, emotional lability, insomnia, nervousness, personality disorder, speech disorder, vertigo

Dermatologic: Rash (5%, similar to placebo), skin disorder

Endocrine & metabolic: Dysmenorrhea, menstrual disorder

Gastrointestinal: Abdominal pain, appetite increased, constipation, diarrhea, nausea, vomiting

Genitourinary: Urinary tract infection

Hematologic: Purpura

Neuromuscular & skeletal: Abnormal coordination, abnormal gait, arthralgia, arthrosis, back pain, hyporeflexia, paresthesia, weakness

Ocular: Diplopia, eye pain, nystagmus

Otic: Ear pain

Respiratory: Nasal congestion, sinusitis, throat irritation, upper respiratory tract infection

<1% (Limited to important or life-threatening): Bilateral optic disc pallor, optic/retinal atrophy, and rare optic neuritis have been reported (usually in first year of therapy). Additional rare reactions include hallucinations, hypomania, mania, psychosis, suicidal behavior, angioedema, hypersensitivity, urticaria, and stupor.

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Phenytoin: Vigabatrin may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring Parameters Ophthalmologic examination at baseline and periodically during therapy (every 3 months); including mydriatic peripheral fundus examination and visual field perimetry. Observe patient for excessive sedation, especially when instituting or increasing therapy.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Powder for oral suspension [sachets]:

Sabril® [CAN]: 0.5 g [not available in the U.S.]

Tablet:

Sabril® [CAN]: 500 mg [not available in the U.S.]

Generic Available No

Manufacturer Aventis Pharma (Canada)

Mechanism of Action Irreversibly inhibits gamma-aminobutyric acid transaminase (GABA-T), increasing the levels of the inhibitory compound gamma amino butyric acid (GABA) within the brain. Duration of effect is dependent upon rate of GABA-T resynthesis.

Pharmacodynamics/Kinetics

Duration (rate of GABA-T resynthesis dependent): Variable (not strictly correlated to serum concentrations)

Absorption: Rapid

Metabolism: Minimal

Half-life elimination: 5-8 hours; Elderly: Up to 13 hours

Time to peak: 2 hours

Excretion: Urine (70%, as unchanged drug)

Pharmacotherapy Pearls Not available in U.S.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

VinBLAStine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

VinBLAStine may be confused with vinCRIStine, vinorelbine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Note: Must be dispensed in overwrap which bears the statement **"Do not remove covering until the moment of injection. Fatal if given intrathecally. For I.V. use only."** Syringes should be labeled: **"Fatal if given intrathecally. For I.V. use only."**

Pronunciation(vin BLAS teen)

Pharmacologic CategoryAntineoplastic Agent, Natural Source (Plant) Derivative; Antineoplastic Agent, Vinca Alkaloid

Use: Labeled IndicationsTreatment of Hodgkin's and non-Hodgkin's lymphoma; testicular cancer; breast cancer; mycosis fungoides; Kaposi's sarcoma; histiocytosis (Letterer-Siwe disease); choriocarcinoma

Use: Unlabeled/InvestigationalTreatment of bladder cancer, melanoma, nonsmall cell lung cancer (NSCLC), ovarian cancer, prostate cancer, renal cancer, soft tissue sarcoma (desmoid tumors)

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted. **Note:** Frequency and duration of therapy may vary by indication, concomitant combination chemotherapy and hematologic response. **For I.V. use only.**

Antineoplastic (typical dosages): I.V.: Initial: 3.7 mg/m^2; adjust dose every 7 days (based on white blood cell response) up to 5.5 mg/m^2 (second dose); 7.4 mg/m^2 (third dose); 9.25 mg/m^2 (fourth dose); and 11.1 mg/m^2 (fifth dose); do not administer more frequently than every 7 days.

Usual range: 5.5-7.4 mg/m^2 every 7 days; Maximum dose: 18.5 mg/m^2; dosage adjustment goal is to reduce white blood cell count to ~3000/mm^3

Indication-specific dosing:

Hodgkin’s disease: Usual dose: 6 mg/m^2 every 2 weeks (as part of a combination chemotherapy regimen) (Horning, 2002; Bartlett, 1995)

Testicular cancer: Usual dose: 0.11 mg/kg daily for 2 days every 3 weeks (as part of a combination chemotherapy regimen) (Loehrer, 1998) **or** 6 mg/m^2/day for 2 days every 3-4 weeks (as part of a combination chemotherapy regimen) (Clemm, 1986)

Bladder cancer (unlabeled use): Usual dose: 3 mg/m^2 every 7 days for 3 out of 4 weeks (as part of combination chemotherapy) (Sternberg, 2001) **or** 3 mg/m^2 days 2, 15, and 22 of a 28-day treatment cycle (as part of a combination chemotherapy regimen) (von der Maase, 2000)

Melanoma (unlabeled used): 2 mg/m^2 days 1-4 and 22-25 of a 6-week treatment cycle (as part of a combination chemotherapy regimen) (Eton, 2002)

Nonsmall cell lung cancer (unlabeled use): 4 mg/m^2 days 1, 8, 15, 22, and 29, then every 2 weeks (as part of combination chemotherapy) (Arriagada, 2004)

Ovarian cancer (unlabeled use): 0.11 mg/kg daily for 2 days every 3 weeks (as part of a combination chemotherapy regimen) (Loehrer, 1998)

Prostate cancer (unlabeled use): 4 mg/m^2 every week for 6 weeks of an 8-week treatment cycle (as part of combination chemotherapy) (Hudes, 1999)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDetails concerning dosing in combination regimens should also be consulted. **Note:** Frequency and duration of therapy may vary by indication, concomitant combination chemotherapy and hematologic response. **For I.V. use only.**

Hodgkin’s disease: I.V.: Initial dose: 6 mg/m^2; do not administer more frequently than every 7 days

Letterer-Siwe disease: I.V.: Initial dose: 6.5 mg/m^2; do not administer more frequently than every 7 days

Testicular cancer: I.V.: Initial dose: 3 mg/m^2; do not administer more frequently than every 7 days

Dosing: Renal ImpairmentAccording to FDA-approved labeling, no adjustment is necessary in patients with renal impairment.

Dosing: Hepatic Impairment

The FDA-approved labeling recommends the following guidelines: Serum bilirubin >3 mg/dL: Administer 50% of dose

The following guidelines have been used by some clinicians:

Serum bilirubin >3.1 or ALT/AST >3 times ULN: Avoid use (Floyd, 2006) **or**

Serum bilirubin 1.5-3 mg/dL or AST 60-180 units: Administer 50% of dose

Serum bilirubin 3-5 mg/dL: Administer 25% of dose

Serum bilirubin >5 mg/dL or AST >180 units: Avoid use

Dosing: Combination Regimens

Bladder cancer:

CMV

M-VAC (Bladder Cancer)

Breast cancer:

M-VAC (Breast Cancer)

VATH

VM

Cervical cancer: M-VAC (Cervical Cancer)

Endometrial cancer: M-VAC (Endometrial Cancer)

Head and Neck cancer: M-VAC (Head and Neck Cancer)

Lung cancer (nonsmall cell): Cisplatin-Vinblastine (NSCLC)

Lymphoma, Hodgkin's:

ABVD

CAD/MOPP/ABV

ChIVPP

Etoposide-Vinblastine-Doxorubicin (Hodgkin's)

MOPP/ABV Hybrid

MOPP/ABVD

MVPP

Stanford V Regimen

Melanoma:

Cisplatin-Vinblastine-Dacarbazine (Melanoma)

CVD-Interleukin-Interferon (Melanoma)

Prostate cancer:

Doxorubicin + Ketoconazole/Estramustine + Vinblastine

Estramustine-Vinblastine

Soft tissue sarcoma: Methotrexate-Vinblastine (Desmoid Tumor)

Testicular cancer:

PVB

VBP

VIP (Vinblastine) (Testicular Cancer)

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Vesicant. **Fatal if given intrathecally.** For I.V. administration only, usually as a slow (2-3 minutes) push, or a bolus (5-15 minutes) infusion; the manufacturer recommends an undiluted 1-minute infusion to prevent venous irritation/extravasation. Prolonged administration times and/or increased administration volumes may the risk of vein irritation and extravasation. Assure proper needle or catheter placement prior to administration.

Administration: I.V. DetailpH: 3.5-5.0

Storage**Note: Must be dispensed in overwrap which bears the statement “Do not remove covering until the moment of injection. Fatal if given intrathecally. For I.V. use only.” Syringes should be labeled: “Fatal if given intrathecally. For I.V. use only.”**

Store intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. Solutions reconstituted in bacteriostatic NS are stable for 28 days under refrigeration.

ReconstitutionReconstitute lyophilized powder to a concentration of 1 mg/mL with NS or bacteriostatic NS. For infusion, may dilute in 50 mL NS or D_5W; dilution in larger volumes (≥100 mL) of I.V. fluids is not recommended. Use appropriate precautions for handling and disposal.

CompatibilityStable in D_5W, LR, NS

Y-site administration: Compatible: Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, bleomycin, cisplatin, cyclophosphamide, doxorubicin, doxorubicin liposome, droperidol, etoposide phosphate, filgrastim, fludarabine, fluorouracil, gatifloxacin, gemcitabine, granisetron, heparin, leucovorin calcium, melphalan, methotrexate, metoclopramide, mitomycin, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vincristine, vinorelbine. **Incompatible:** Cefepime, furosemide, lansoprazole.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, droperidol, fluorouracil, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vincristine. **Incompatible:** Furosemide. **Variable (consult detailed reference):** Doxorubicin, heparin.

Compatibility when admixed: Compatible: Bleomycin, dacarbazine. **Variable (consult detailed reference):** Doxorubicin.

ContraindicationsSignificant granulocytopenia; presence of bacterial infection; I.T. administration is contraindicated (may result in death)

Allergy Considerations

- Vinca Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- NOT for intrathecal use: See “Other warnings/precautions” below.
- Vesicant: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal. Avoid eye contamination (exposure may cause severe irritation).

Concerns related to adverse effects:

- Bone marrow suppression: Leukopenia is common; granulocytopenia may be severe with higher doses. Leukopenia may be more pronounced in cachectic patients and patients with skin ulceration. Thrombocytopenia and anemia may occur rarely.
- Neurotoxicity: May rarely cause disabling neurotoxicity; usually reversible.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; toxicity may be increased; may require dosage modification.
- Ischemic heart disease: Use with caution in patients with ischemic heart disease.

Concurrent drug therapy issues:

- Itraconazole: Itraconazole may decrease the metabolism of vinblastine via CYP3A4 inhibition and may increase the effects of vinblastine via P-glycoprotein effects. Severe myelosuppression and neurotoxicity may occur.
- Mitomycin C: Acute shortness of breath and severe bronchospasm have been reported, most often in association with concurrent administration of mitomycin; may occur within minutes to several hours following vinblastine administration or up to 14 days following mitomycin administration; use caution in patients with pre-existing pulmonary disease.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- NOT for intrathecal use: **[U.S. Boxed Warning]: For I.V. use only. Intrathecal administration may result in death.** Must be dispensed in overwrap which bears the statement **"Do not remove covering until the moment of injection. Fatal if given intrathecally. For I.V. use only."**
- Vesicant: **[U.S. Boxed Warning]: Vinblastine is a moderate vesicant; avoid extravasation. Individuals administering should be experienced in vinblastine administration.** Assure proper needle or catheter placement prior to administration.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated resorption and teratogenic effects. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant during vinblastine treatment. Aspermia has been reported in males who have received treatment with vinblastine.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse ReactionsFrequency not defined.

Common:

Cardiovascular: Hypertension

Central nervous system: Malaise

Dermatologic: Alopecia

Gastrointestinal: Constipation

Hematologic: Myelosuppression, leukopenia/granulocytopenia (nadir: 5-10 days; recovery: 7-14 days; dose-limiting toxicity)

Neuromuscular & skeletal: Bone pain, jaw pain, tumor pain

Less common:

Cardiovascular: Angina, cerebrovascular accident, coronary ischemia, ECG abnormalities, MI, Raynaud's phenomenon

Central nervous system: Depression, dizziness, headache, neurotoxicity (duration: >24 hours), seizure, vertigo

Dermatologic: Dermatitis, photosensitivity (rare), rash, skin blistering

Endocrine & metabolic: Aspermia, hyperuricemia, SIADH

Gastrointestinal: Abdominal pain, anorexia, diarrhea, gastrointestinal bleeding, hemorrhagic enterocolitis, ileus, metallic taste, nausea (mild), paralytic ileus, rectal bleeding, stomatitis, vomiting (mild)

Genitourinary: Urinary retention

Hematologic: Anemia, thrombocytopenia (recovery within a few days)

Local: Cellulitis (with extravasation), irritation, phlebitis (with extravasation), radiation recall

Neuromuscular & skeletal: Deep tendon reflex loss, myalgia, paresthesia, peripheral neuritis, weakness

Ocular: Nystagmus

Otic: Auditory damage, deafness, vestibular damage

Respiratory: Bronchospasm, dyspnea, pharyngitis

Oncology: VesicantYes; see Management of Drug Extravasations.
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak), 3A4 (weak)
Drug Interactions

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Itraconazole: May increase the serum concentration of VinBLAStine. *Risk C: Monitor therapy*

Lopinavir: May increase the serum concentration of VinBLAStine. Management: Monitor closely for signs and symptoms of vinblastine toxicity; consider temporary interruption of lopinavir/ritonavir antiviral therapy if patients develop significant toxicity with concurrent use. *Risk D: Consider therapy modification*

Mitomycin: Antineoplastic Agents (Vinca Alkaloids) may enhance the adverse/toxic effect of Mitomycin. Specifically, the risk of pulmonary toxicity may be increased. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Tolterodine: VinBLAStine may increase the serum concentration of Tolterodine. Management: Reduce tolterodine dosage to 1 mg twice daily (regular release formulation) or 2 mg daily (extended release formulation) and monitor for increased levels/effects of tolterodine with initiation of vinblastine therapy. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease vinblastine levels). Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersCBC with differential and platelet count, serum uric acid, hepatic function tests

Nursing: Physical Assessment/MonitoringUse caution with impaired liver function. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, previous or concurrent use mitomycin-C can cause severe reaction). Premedication with antiemetic is advisable. Infusion site must be monitored closely to prevent extravasation (vesicant will cause tissue damage and necrosis). Assess results of laboratory tests, renal function, and adverse reactions (eg, SIADH, bone marrow suppression, leukopenia, hypertension, gastrointestinal disturbance, myalgia, depression, paresthesia) prior to each infusion and throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, serum uric acid, hepatic function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion; report immediately any redness, swelling, burning, or pain at infusion site; sudden difficulty breathing; swelling; chest pain; or chills. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals will help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause hair loss (will grow back after therapy); nausea or vomiting (request antiemetic); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); feelings of extreme weakness or lethargy (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or mouth sores (use soft toothbrush, waxed dental floss, and frequent oral care). Report persistent constipation or abdominal pain; numbness or tingling in fingers or toes (use care to prevent injury); weakness or pain in muscles or jaw; signs of infection (eg, fever, chills, sore throat, burning urination, fatigue); unusual bleeding (eg, tarry stools, easy bruising, blood in stool, urine, or mouth); unresolved mouth sores; skin rash or itching; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Do not get pregnant (females) or cause a pregnancy (males) during this therapy. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sulfate: 10 mg

Injection, solution, as sulfate: 1 mg/mL (10 mL) [contains benzyl alcohol]

Generic AvailableYes

Mechanism of ActionVinblastine binds to tubulin and inhibits microtubule formation, therefore, arresting the cell at metaphase by disrupting the formation of the mitotic spindle; it is specific for the M and S phases. Vinblastine may also interfere with nucleic acid and protein synthesis by blocking glutamic acid utilization.

Pharmacodynamics/Kinetics

Distribution: V_d: 27.3 L/kg; binds extensively to tissues; does not penetrate CNS or other fatty tissues; distributes to liver

Protein binding: 99%

Metabolism: Hepatic to active metabolite

Half-life elimination: Biphasic: Initial: 4 minutes; Terminal: 25 hours

Excretion: Feces (95%); urine (<1% as unchanged drug)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

VinCRIStine may be confused with vinBLAStine

Oncovin® may be confused with Ancobon®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

To prevent fatal inadvertent intrathecal injection, it is recommended that all doses be dispensed in a small minibag. If dispensing vincristine in a syringe, vincristine must be packaged in the manufacturer-provided overwrap which bears the statement **"Do not remove covering until the moment of injection. For intravenous use only. Fatal if given intrathecally."**

Pronunciation(vin KRIS teen)

U.S. Brand NamesVincasar PFS®

Canadian Brand NamesVincasar® PFS®

Pharmacologic CategoryAntineoplastic Agent, Natural Source (Plant) Derivative; Antineoplastic Agent, Vinca Alkaloid

Use: Labeled IndicationsTreatment of leukemias, Hodgkin's disease, non-Hodgkin's lymphomas, Wilms' tumor, neuroblastoma, rhabdomyosarcoma

Dosing: Adults**Note:** Doses are often capped at 2 mg; however, this may reduce the efficacy of the therapy and may not be advisable. Refer to individual protocols; orders for single doses >2.5 mg or >5 mg/treatment cycle should be verified with the specific treatment regimen and/or an experienced oncologist prior to dispensing.

Antineoplastic (typical dosages): I.V.: 0.4-1.4 mg/m^2, may repeat every week **or**

0.4-0.5 mg/day continuous infusion for 4 days every 4 weeks **or**

0.25-0.5 mg/m^2/day continuous infusion for 5 days every 4 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. **Note:** Doses are often capped at 2 mg; however, this may reduce the efficacy of the therapy and may not be advisable. Orders for single doses >2.5 mg or >5 mg/treatment cycle should be verified with the specific treatment regimen and/or an experienced oncologist prior to dispensing.

Antineoplastic (typical dosages): I.V.:

Children ≤10 kg or BSA <1 m^2: Initial therapy: 0.05 mg/kg once weekly then titrate dose

Children >10 kg or BSA ≥1 m^2: 1-2 mg/m^2, may repeat once weekly for 3-6 weeks; maximum single dose: 2 mg

Neuroblastoma: I.V. continuous infusion with doxorubicin: 1 mg/m^2/day for 72 hours

Dosing: Renal ImpairmentNo adjustment is necessary in patients with renal impairment.

Dosing: Hepatic Impairment

The FDA-approved labeling recommends the following guidelines: Serum bilirubin >3 mg/dL: Administer 50% of normal dose

The following guidelines have been used by some clinicians:

Serum bilirubin 1.5-3 mg/dL or AST 60-180 units: Administer 50% of dose

Serum bilirubin 3-5 mg/dL: Administer 25% of dose

Serum bilirubin >5 mg/dL or AST >180 units: Avoid use

Floyd, 2006: Serum bilirubin 1.5-3 mg/dL or ALT/AST 2-3 times ULN or alkaline phosphatase elevated: Administer 50% of dose

Dosing: Combination Regimens

Breast cancer: CMFVP (Cooper Regimen, VPCMF)

Brain tumors:

- 8 in 1 (Brain Tumors)
- COPE
- MOP
- MOPP (Medulloblastoma)
- PCV
- POC

Gestational trophoblastic tumor:

- CHAMOCA (Modified Bagshawe Regimen)
- CHAMOMA (Bagshawe Regimen)
- EMA/CO

Head and neck cancer: CABO

Leukemia, acute lymphocytic:

- DVP
- Hyper-CVAD + Imatinib
- Hyper-CVAD (Leukemia, Acute Lymphocytic)
- Larson Regimen
- Linker Protocol
- MTX/6-MP/VP (Maintenance)
- POMP
- PVA (POG 8602)
- PVDA
- VAD/CVAD

Leukemia, chronic lymphocytic: CVP (Leukemia)

Lung cancer (small cell): CAVE

Lymphoma, Hodgkin's:

- BEACOPP
- CAD/MOPP/ABV
- COMP
- LOPP
- MOPP (Lymphoma, Hodgkin's Disease)
- MOPP/ABV Hybrid
- MOPP/ABVD
- OPA
- OPPA
- Stanford V Regimen

Lymphoma, non-Hodgkin's:

- CHOP
- CNOP
- CODOX-M
- CODOX-M/IVAC
- COMLA
- COP-BLAM

- COPP
- CVP (Lymphoma, non-Hodgkin's)
- EPOCH
- Hyper-CVAD (Lymphoma, non-Hodgkin's)
- MACOP-B
- m-BACOD
- Pro-MACE-CytaBOM
- Rituximab-CHOP
- R-CVP

Lymphoma, non-Hodgkin's (Burkitt's): CODOX-M/IVAC

Lymphoma, non-Hodgkin's (Mantle cell): Hyper-CVAD + Rituximab

Melanoma:

- BOLD
- BOLD (Melanoma)
- BOLD + Interferon

Multiple myeloma:

- Doxorubicin (Liposomal)-Vincristine-Dexamethasone
- Hyper-CVAD (Multiple Myeloma)
- M-2
- VAD
- VBAP
- VBMCP
- VCAP

Neuroblastoma:

- CAV-P/VP
- CE-CAdO
- HIPE-IVAD
- N4SE Protocol
- N6 Protocol
- OPEC
- OPEC-D
- PE-CAdO
- Regimen A1

Prostate cancer: Cyclophosphamide + Vincristine + Dexamethasone

Retinoblastoma:

- 8 in 1 (Retinoblastoma)
- CO
- CV
- VAC (Retinoblastoma)

Rhabdomyosarcoma:

- CEV
- VAC Pulse
- VAC (Rhabdomyosarcoma)

Sarcoma:

CYVADIC

VAC Alternating With IE (Ewing's Sarcoma)

Wilms' tumor:

AAV (DD)

ACAV (J)

AV (EE)

AV (K)

EE-4A

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Vesicant. For I.V. use only. **Fatal if given intrathecally.** Usually administered as short (10-15 minutes) infusion (preferred) or slow (1-2 minutes) push; 24-hour continuous infusions are occasionally used

Administration: I.V. DetailFollow guidelines for handling cytotoxic agents. Drug should be administered by qualified personnel. Do not allow to come in contact with skin. If contact occurs, wash thoroughly with soap and water. Avoid extravasation; agent is a vesicant and will cause sloughing.

pH: 3.5-5.5

Administration: OtherIntralesional injection has been reported for Kaposi's sarcoma

Storage

Undiluted vials: Store under refrigeration. May be stable for up to 30 days at room temperature.

I.V. solution: Diluted in 20-50 mL NS or D$_5$W, stable for 7 days under refrigeration, or 2 days at room temperature. In ambulatory pumps, solution is stable for 7-10 days at room temperature.

Reconstitution Solutions for I.V. infusion may be mixed in NS or D$_5$W. **Note:** The World Health Organization (WHO) recommends dispensing vincristine in a minibag, rather than a syringe.

CompatibilityStable in D$_5$W, LR, NS.

Y-site administration: Compatible: Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, bleomycin, cisplatin, cladribine, cyclophosphamide, doxorubicin, doxorubicin liposome, droperidol, etoposide phosphate, filgrastim, fludarabine, fluorouracil, gatifloxacin, gemcitabine, granisetron, heparin, leucovorin, linezolid, melphalan, methotrexate, metoclopramide, mitomycin, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, topotecan, vinblastine, vinorelbine. **Incompatible:** Cefepime, furosemide, idarubicin, sodium bicarbonate.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, doxapram, doxorubicin, droperidol, fluorouracil, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine. **Incompatible:** Furosemide.

Compatibility when admixed: Compatible: Bleomycin, cytarabine, doxorubicin with ondansetron, fluorouracil, methotrexate. **Variable (consult detailed reference):** Doxorubicin with etoposide.

ContraindicationsHypersensitivity to vincristine or any component of the formulation; **for I.V. use only, fatal if given intrathecally**; patients with demyelinating form of Charcot-Marie-Tooth syndrome; pregnancy

Allergy Considerations

- Vinca Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

- Not for intrathecal use: See “Other warnings/precautions” below.
- Vesicant: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal; avoid eye contamination.

Concerns related to adverse effects:

- Constipation: With use, constipation and/or paralytic ileus may occur; all patients should be on a prophylactic bowel management regimen.

- Neurotoxicity: Alterations in mental status such as depression, confusion, or insomnia may occur; neurologic effects may be additive with those of other neurotoxic agents and spinal cord irradiation.

- Respiratory effects: Observe closely for shortness of breath and bronchospasm.

- Urinary tract disturbances: With use, urinary tract disturbances may occur.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage modification required.

- Neuromuscular disease: Use with caution in patients with pre-existing neuromuscular disease; dosage modification required.

Concurrent drug therapy issues:

- Mitomycin C: Monitor closely for shortness of breath or bronchospasm in patients receiving in combination with mitomycin C.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Not for intrathecal use: **[U.S. Boxed Warning]: Intrathecal administration has uniformly caused severe neurologic damage and/or death; vincristine should never be administered by this route. For I.V. use only.**

- Vesicant: **[U.S. Boxed Warning]: Vincristine is a vesicant; avoid extravasation. (Individuals administering should be experienced in vincristine administration.)**

Pregnancy Risk FactorD
LactationEnters breast milk/not recommended
Adverse Reactions

>10%: Dermatologic: Alopecia (20% to 70%)

1% to 10%:

Cardiovascular: Orthostatic hypotension or hypertension, hyper-/hypotension

Central nervous system: CNS depression, confusion, cranial nerve paralysis, fever, headache, insomnia, motor difficulties, seizure

Intrathecal administration of vincristine has uniformly caused death; vincristine should never be administered by this route. Neurologic effects of vincristine may be additive with those of other neurotoxic agents and spinal cord irradiation.

Dermatologic: Rash

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Abdominal cramps, anorexia, bloating, constipation (and possible paralytic ileus secondary to neurologic toxicity), diarrhea, metallic taste, nausea (mild), oral ulceration, vomiting, weight loss

Genitourinary: Bladder atony (related to neurotoxicity), dysuria, polyuria, urinary retention

Hematologic: Leukopenia (mild), thrombocytopenia, myelosuppression (onset: 7 days; nadir: 10 days; recovery: 21 days)

Local: Phlebitis, tissue irritation and necrosis if infiltrated

Neuromuscular & skeletal: Cramping, jaw pain, leg pain, myalgia, numbness, weakness

Peripheral neuropathy: Frequently the dose-limiting toxicity of vincristine. Most frequent in patients >40 years of age; occurs usually after an average of 3 weekly doses, but may occur after just one dose. Manifested as loss of the deep tendon reflexes in the lower extremities, numbness, tingling, pain, paresthesia of the fingers and toes (stocking glove sensation), and “foot drop” or “wrist drop.”

Ocular: Optic atrophy, photophobia

<1%: SIADH (rare), stomatitis

Oncology: VesicantYes; moderate. See Management of Drug Extravasations.
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)
Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lopinavir: May increase the serum concentration of VinCRIStine. Management: Monitor closely for signs and symptoms of vincristine toxicity; consider temporary interruption of lopinavir/ritonavir antiviral therapy if patients develop significant toxicity with concurrent use. *Risk D: Consider therapy modification*

Mitomycin: Antineoplastic Agents (Vinca Alkaloids) may enhance the adverse/toxic effect of Mitomycin. Specifically, the risk of pulmonary toxicity may be increased. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

NIFEdipine: May decrease the excretion of VinCRIStine. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease vincristine levels.

Monitoring ParametersSerum electrolytes (sodium), hepatic function tests, neurologic examination, CBC, serum uric acid

Nursing: Physical Assessment/MonitoringUse caution with impaired liver function or pre-existing neuromuscular disease. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, previous or concurrent use with mitomycin-C can cause severe reaction). Premedication with antiemetic is advisable. Infusion site must be monitored closely to prevent extravasation (vesicant will cause tissue damage and necrosis). May cause severe constipation, paralytic ileus, intestinal obstruction, necrosis, and/or perforation; prophylactic bowel management regimen may be advisable. Assess results of laboratory tests, hepatic function, and adverse reactions prior to each infusion and throughout therapy (eg, CNS [motor difficulties, seizure, depression], neuromuscular [myalgia, cramping], peripheral neuropathy, photophobia). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes (sodium), hepatic function, CBC, serum uric acid

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion; report immediately any redness, swelling, burning, or pain at infusion site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals will help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause postural hypotension (use caution when rising from sitting or lying position or when climbing steps); hair loss (will grow back after therapy); nausea or vomiting (request antiemetic if persistent); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); feelings of extreme weakness or lethargy (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or mouth sores (use soft toothbrush, waxed dental floss, and frequent oral care). Report persistent gastrointestinal changes (eg, constipation, abdominal cramps, bloating); numbness, tingling, or pain in legs, fingers, or toes (use care to prevent injury); signs of infection (eg, fever, chills, sore throat, burning urination, fatigue); unusual bleeding (eg, tarry stools, easy bruising, blood in stool, urine, or mouth); unresolved mouth sores; skin rash or itching; respiratory difficulty; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant (females) or cause a pregnancy (males) during this therapy. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sulfate [preservative free]:

Vincasar PFS®: 1 mg/mL (1 mL, 2 mL)

Generic AvailableYes

Mechanism of ActionBinds to tubulin and inhibits microtubule formation, therefore, arresting the cell at metaphase by disrupting the formation of the mitotic spindle; it is specific for the M and S phases. Vincristine may also interfere with nucleic acid and protein synthesis by blocking glutamic acid utilization.

Pharmacodynamics/Kinetics

Absorption: Oral: Poor

Distribution: V_d: 163-165 L/m^2; poor penetration into CSF; rapidly removed from bloodstream and tightly bound to tissues; penetrates blood-brain barrier poorly

Protein binding: 75%

Metabolism: Extensively hepatic

Half-life elimination: Terminal: 24 hours

Excretion: Feces (~80%); urine (<1% as unchanged drug)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

To prevent fatal inadvertent intrathecal injection, it is recommended by ISMP that all doses be dispensed in a small minibag. **Fatal if given intrathecally.**

Pronunciation(VIN de seen)

Pharmacologic CategoryAntineoplastic Agent, Vinca Alkaloid

Use: Unlabeled/InvestigationalInvestigational: Management of acute lymphocytic leukemia, chronic myelogenous leukemia; breast, head, neck, and lung cancers; lymphomas (Hodgkin's and non-Hodgkin's)

Dosing: AdultsRefer to individual protocols. I.V.:

3-4 mg/m^2 /week **or**

1-2 mg/m^2 days 1 and 2 every 2 weeks **or**

1-2 mg/m^2 days 1-5 (continuous infusion) every 2-4 weeks **or**

1-2 mg/m^2 days 1-5 every 3-4 weeks

Dosage adjustment in hepatic impairment: Dosage reductions of 50% to 75% have been suggested for “severe” hepatic dysfunction; however, specific guidelines have not been published.

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentDosage reductions of 50% to 75% have been suggested for “severe” hepatic dysfunction; however, specific guidelines have not been published.

Dosing: Combination Regimens

Breast cancer: VM

Lymphoma, Hodgkin's disease: CAD/MOPP/ABV

Calculations

- Body Surface Area: Adults

Administration: I.V.Usually administered as a rapid I.V. push (2-3 minutes) or short (15-20 minutes) infusion; 24-hour continuous infusions are occasionally used.

StorageReconstituted solutions are stable for 30 days under refrigeration (2°C to 8°C/36°F to 46°F). Solutions diluted in dextrose or saline for I.V. infusion are stable for 24 hours at room temperature (15°C to 30°C/59°F to 86°F). **The drug will precipitate at pH >6.**

ReconstitutionThe powder is reconstituted to a concentration of 1 mg/mL.

RestrictionsNot available in U.S./Investigational

ContraindicationsHypersensitivity to vindesine, vinca alkaloids, or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Disease-related concerns:

- Hepatic impairment: Use with caution (if at all) in patients with hepatic impairment.

- Neurologic impairment: Use with caution (if at all) in patients with neurologic problems.

Other warnings/precautions:

- Cross-resistance: Vindesine has been reported to be cross-resistance with vincristine.

- Not for intrathecal administration: **Intrathecal administration may be fatal.**

LactationBreast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Pyrexia, malaise (up to 60%)

Dermatologic: Alopecia (6% to 92%)

Gastrointestinal: Mild nausea and vomiting (7% to 27%), constipation (10% to 17%) - related to the neurotoxicity

Hematologic: Leukopenia (50%) and thrombocytopenia (14% to 26%), may be dose limiting; thrombocytosis (20% to 28%)

Nadir: 6-12 days

Recovery: Days 14-18

Neuromuscular & skeletal: Paresthesia (40% to 70%); loss of deep tendon reflexes (35% to 60%, may be dose limiting); myalgia (up to 60%)

1% to 10%:

Dermatologic: Rashes

Gastrointestinal: Loss of taste

Hematologic: Anemia

Local: Phlebitis

Neuromuscular & skeletal: Facial paralysis

<1%: Acute chest pain, ECG changes, paralytic ileus, jaw pain, photophobia

Oncology: VesicantYes; see Management of Drug Extravasations.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 5 mg

Generic AvailableNo

Mechanism of ActionVindesine is a semisynthetic vinca alkaloid, having a mechanism of action similar to the other vinca derivatives. It arrests cell division in metaphase through inhibition of microtubular formation of the mitotic spindle. The drug is cell-cycle specific for the S phase.

Pharmacodynamics/Kinetics

Distribution: V_d: 8 L/kg; minimal distribution to adipose tissue or CNS

Metabolism: Hepatic

Half-life elimination:

Triphasic; Alpha: 2 minutes; Beta: 1 hour

Terminal: 24 hours

Excretion: Feces; urine (~3% to 25% of dose as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Loss of taste and facial paralysis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMalaise is common

Mental Health: Effects on Psychiatric TreatmentHematological side effects are common; use caution with clozapine, carbamazepine, and valproic acid.

Mental Health CommentParesthesias are common.

Vinorelbine-Cisplatin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Lung Cancer (Nonsmall Cell)
Regimen Use Lung cancer, nonsmall cell
Index Terms Cisplatin-Vinorelbine; VC
Regimen NOTE: Multiple variations are listed below.

Variation 1:

Cisplatin: I.V.: 50 mg/m^2/day days 1 and 8

[total dose/cycle = 100 mg/m^2]

Vinorelbine: I.V.: 25 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days for total of 4 cycles

Variation 2:

Vinorelbine: I.V.: 25 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 100 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days

Variation 3:

Vinorelbine: I.V.: 30 mg/m^2 weekly

Cisplatin: I.V.: 120 mg/m^2/day days 1 and 29, then once every 6 weeks

Variation 4:

Vinorelbine: I.V.: 30 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 90 mg/m^2]

Cisplatin: I.V.: 80 mg/m^2 day 1

[total dose/cycle = 80 mg/m^2]

Repeat cycle every 21 days for total of 4 cycles

Note: Vinorelbine treatment is discontinued after day 1 of cycle 4

Variation 5:

Vinorelbine: I.V.: 30 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 120 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 28 days for total of 3 or 4 cycles

Note: Vinorelbine treatment is discontinued after day 1 of last treatment cycle

Vinorelbine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Vinorelbine may be confused with vinBLAStine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Vinorelbine is intended **for I. V. use only**: Inadvertent intrathecal administration of other vinca alkaloids has resulted in death. Syringes containing vinorelbine should be labeled **“For I.V. use only. Fatal if given intrathecally.”**

Pronunciation(vi NOR el been)

U.S. Brand NamesNavelbine®

Canadian Brand NamesNavelbine®; Vinorelbine Injection, USP; Vinorelbine Tartrate for Injection

Pharmacologic CategoryAntineoplastic Agent, Natural Source (Plant) Derivative; Antineoplastic Agent, Vinca Alkaloid

Use: Labeled IndicationsTreatment of nonsmall cell lung cancer (NSCLC)

Use: Unlabeled/InvestigationalTreatment of breast cancer, cervical cancer, and ovarian cancer

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted.

Nonsmall cell lung cancer: I.V.:

Single-agent therapy: 30 mg/m^2/dose every 7 days

Combination therapy with cisplatin: 25-30 mg/m^2/dose every 7 days (in combination with cisplatin)

Breast cancer (unlabeled use): I.V.: 25 mg/m^2/dose every 7 days

Cervical cancer (unlabeled use): I.V.: 30 mg/m^2/dose days 1 and 8 of a 21-day treatment cycle

Ovarian cancer (unlabeled use): I.V.: 25 mg/m^2/dose every 7 days **or** 30 mg/m^2/dose days 1 and 8 of a 21-day treatment cycle

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic Impairment

The FDA-approved labeling guidelines are as follows: Vinorelbine should be administered with caution in patients with hepatic insufficiency. In patients who develop hyperbilirubinemia during treatment with vinorelbine, the dose should be adjusted for total bilirubin as follows:

Serum bilirubin ≤2 mg/dL: Administer 100% of dose

Serum bilirubin 2.1-3 mg/dL: Administer 50% of dose

Serum bilirubin >3 mg/dL: Administer 25% of dose

In patients with concurrent hematologic toxicity and hepatic impairment, administer the lower of the doses determined from the adjustment recommendations under Adult Dosing.

Dosing: Adjustment for Toxicity

Dosage adjustment in hematological toxicity (based on granulocyte counts):

Granulocytes ≥1500 cells/mm^3 on day of treatment: Administer 100% of starting dose.

Granulocytes 1000-1499 cells/mm^3 on day of treatment: Administer 50% of starting dose.

Granulocytes <1000 cells/mm^3 on day of treatment: Do not administer. Repeat granulocyte count in 1 week. If 3 consecutive doses are held because granulocyte count is <1000 cells/mm^3, discontinue vinorelbine.

Adjustment: For patients who, during treatment, have experienced fever or sepsis while granulocytopenic or had 2 consecutive weekly doses held due to granulocytopenia, subsequent doses of vinorelbine should be:

75% of starting dose for granulocytes ≥1500 cells/mm^3

37.5% of starting dose for granulocytes 1000-1499 cells/mm^3

Dosage adjustment for neurotoxicity: Neurotoxicity ≥grade 2: Discontinue treatment

Dosing: Combination Regimens

Breast cancer:

Paclitaxel-Vinorelbine

VD

Vinorelbine-FEC

Vinorelbine-Trastuzumab

Vinorelbine-Trastuzumab-FEC

Cervical cancer: Cisplatin-Vinorelbine

Leukemia, acute lymphocytic: TVTG

Leukemia, acute myeloid: TVTG

Lung cancer (nonsmall cell):

Cetuximab-Cisplatin-Vinorelbine

Gemcitabine-Vinorelbine

Vinorelbine-Cisplatin

Vinorelbine-Gemcitabine

Lymphoma, Hodgkin's: Gemcitabine-Vinorelbine-Doxorubicin (Liposomal)

Prostate cancer: Estramustine + Vinorelbine

Calculations

- Body Surface Area: Adults

Administration: I.V.**FATAL IF GIVEN INTRATHECALLY.** Administer as a direct intravenous push or rapid bolus, over 6-10 minutes (up to 30 minutes). Longer infusions may increase the risk of pain and phlebitis. Intravenous doses should be followed by at least 75-125 mL of saline or D_5W to reduce the incidence of phlebitis and inflammation. Assure proper needle or catheter position prior to administration.

Administration: I.V. DetailDo not administer in an extremity with poor circulation or repeatedly into the same vein.

pH: 3.5 (injection)

StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Intact vials are stable at room temperature of 25°C (77°F) for up to 72 hours. Dilutions in D_5W or NS are stable for 24 hours at room temperature.

ReconstitutionDilute in D_5W or NS to a final concentration of 1.5-3 mg/mL (for syringe) or 0.5-2 mg/mL (for I.V. bag).

CompatibilityStable in $D_5{}^1/_2$NS, D_5W, LR, NS, $^1/_2$NS.

Y-site administration: Compatible: Amikacin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefotaxime, ceftazidime, ceftizoxime, chlorpromazine, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metronidazole, minocycline, mitoxantrone, morphine, nalbuphine, netilmicin, ondansetron, plicamycin, streptozocin, teniposide, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, zidovudine. **Incompatible:** Acyclovir, allopurinol, aminophylline, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, cefazolin, cefoperazone, cefotetan, ceftriaxone, cefuroxime, co-trimoxazole, fluorouracil, furosemide, ganciclovir, methylprednisolone sodium succinate, mitomycin, piperacillin, sodium bicarbonate, thiotepa. **Variable (consult detailed reference):** Heparin.

ContraindicationsPretreatment granulocyte counts <1000/mm^3

Allergy Considerations

- Vinca Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

• Bone marrow suppression: See “Concerns related to adverse effects” below.

• Experienced physician: See “Other warnings/precautions” below.

- Extravasation: See “Other warnings/precautions” below.
- NOT for intrathecal use: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal; avoid eye contamination (exposure may cause severe irritation).

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Severe granulocytopenia may occur with treatment;** granulocytopenia is a dose-limiting toxicity; granulocyte counts should be ≥1000/mm^3 prior to treatment initiation; monitor closely for infections and/or fever; may require dosage adjustment. Use with caution in patients with compromised marrow reserve due to prior chemotherapy therapy or prior radiation therapy.
- Gastrointestinal effects: May cause severe constipation (grade 3-4), paralytic ileus, intestinal obstruction, necrosis, and/or perforation.
- Neuropathy: May cause new onset or worsening of pre-existing neuropathy; use with caution in patients with neuropathy.
- Pulmonary toxicity: Fatal cases of interstitial pulmonary changes and ARDS have been reported with single-agent therapy. Promptly evaluate changes in baseline pulmonary symptoms or any new-onset pulmonary symptoms.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage modification required.
- Neurotoxicity: Use with caution in patients with neurotoxicity; dosage modification required.
- Radiation therapy: May have radiosensitizing effects with prior or concurrent radiation therapy; radiation recall reactions may occur in patients who have received prior radiation therapy.

Concurrent drug therapy issues:

- Cisplatin: The incidence of granulocytopenia is significantly higher when given in combination with cisplatin when compared to single-agent vinorelbine.
- Mitomycin C: Acute shortness of breath and severe bronchospasm have been reported rarely; usually associated with concurrent administration of mitomycin.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Extravasation: **[U.S. Boxed Warning]: Avoid extravasation;** infiltration may cause irritation, thrombophlebitis and/or local tissue necrosis.
- NOT for intrathecal use: **[U.S. Boxed Warning]: Intrathecal administration may result in death.** For I.V. use only.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAnimal studies have demonstrated embryotoxicity, fetotoxicity, decreased fetal weight, and delayed ossification. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant during vinorelbine treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions**Note:** Reported with single-agent therapy.

>10%:

Central nervous system: Fatigue (27%)

Dermatologic: Alopecia (12% to 30%)

Gastrointestinal: Nausea (31% to 44%; grade 3: 1% to 2%), constipation (35%; grade 3: 3%), vomiting (20% to 31%; grade 3: 1% to 2%), diarrhea (12% to 17%)

Hematologic: Leukopenia (83% to 92%; grade 4: 6% to 15%), granulocytopenia (90%; grade 4: 36%; nadir: 7-10 days; recovery 14-21 days; dose-limiting), neutropenia (85%; grade 4: 28%), anemia (83%; grades 3/4: 9%)

Hepatic: AST increased (67%; grade 3: 5%; grade 4: 1%), total bilirubin increased (5% to 13%; grade 3: 4%; grade 4: 3%)

Local: Injection site reaction (22% to 28%; includes erythema, vein discoloration), injection site pain (16%)

Neuromuscular & skeletal: Weakness (36%), peripheral neuropathy (25%; grade 3: 1%; grade 4: <1%)

Renal: Creatinine increased (13%)

1% to 10%:

Cardiovascular: Chest pain (5%)

Dermatologic: Rash (<5%)

Gastrointestinal: Paralytic ileus (1%)

Hematologic: Neutropenic fever/sepsis (8%; grade 4: 4%), thrombocytopenia (3% to 5%; grades 3/4: 1%)

Local: Phlebitis (7% to 10%)

Neuromuscular & skeletal: Loss of deep tendon reflexes (<5%), myalgia (<5%), arthralgia (<5%), jaw pain (<5%)

Otic: Ototoxicity (≤1%)

Respiratory: Dyspnea (7%)

<1%, postmarketing, and/or case reports: Abdominal pain, allergic reactions, anaphylaxis, angioedema, back pain, DVT, dysphagia, esophagitis, flushing, gait instability, headache, hemorrhagic cystitis, hyper-/hypotension, hyponatremia, intestinal necrosis, intestinal obstruction, intestinal perforation, interstitial pulmonary changes, local rash, local urticaria, MI (rare), mucositis, muscle weakness, pancreatitis, paralytic ileus, pneumonia, pruritus, pulmonary edema, pulmonary embolus, radiation recall (dermatitis, esophagitis), skin blistering, syndrome of inappropriate ADH secretion, tachycardia, thromboembolic events, tumor pain, urticaria, vasodilation

Oncology: VesicantYes. See Management of Drug Extravasations.
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak), 3A4 (weak)
Drug Interactions

CISplatin: May enhance the adverse/toxic effect of Vinorelbine. Specifically, the combination may be associated with a higher risk of granulocytopenia. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Mitomycin: Antineoplastic Agents (Vinca Alkaloids) may enhance the adverse/toxic effect of Mitomycin. Specifically, the risk of pulmonary toxicity may be increased. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Paclitaxel: May enhance the neurotoxic effect of Vinorelbine. *Risk C: Monitor therapy*

Paclitaxel (Protein Bound): May enhance the neurotoxic effect of Vinorelbine. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease vinorelbine levels).
Monitoring ParametersCBC with differential and platelet count, hepatic function tests; monitor for new-onset pulmonary symptoms (or worsening from baseline); monitor for neuropathy
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking. Premedication with antiemetic is advisable. May cause severe constipation, paralytic ileus, intestinal obstruction, necrosis, and/or perforation; prophylactic bowel management regimen may be advisable. See Administration for infusion specifics. Infusion site must be monitored closely to prevent extravasation (may cause tissue damage and necrosis). Assess results of laboratory tests regularly. Evaluate therapeutic effectiveness and adverse reactions prior to each infusion and throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelet count, hepatic function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion; report immediately any redness, swelling, burning, or pain at infusion site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals will help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause hair loss (will grow back after therapy); nausea or vomiting (request antiemetic); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); feelings of weakness or lethargy (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or mouth sores (use soft toothbrush, waxed dental floss and frequent oral care). Report persistent constipation or abdominal pain; numbness or tingling in fingers or toes (use care to prevent injury); weakness, numbness, or pain in muscles or extremities; signs of infection (eg, fever, chills, sore throat, burning urination, fatigue); unusual bleeding (eg, tarry stools, easy bruising, blood in stool, urine, or mouth); unresolved mouth sores; skin rash or itching; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Do not get pregnant (females) or cause a pregnancy (males) during this therapy. Consult prescriber for appropriate contraceptive measures. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 10 mg/mL (1 mL, 5 mL)

Navelbine®: 10 mg/mL (1 mL, 5 mL)

Generic AvailableYes

Mechanism of ActionSemisynthetic vinca alkaloid which binds to tubulin and inhibits microtubule formation, therefore, arresting the cell at metaphase by disrupting the formation of the mitotic spindle; it is specific for the M and S phases. Vinorelbine may also interfere with nucleic acid and protein synthesis by blocking glutamic acid utilization.

Pharmacodynamics/Kinetics

Absorption: Unreliable; must be given I.V.

Distribution: V_d: 25-40 L/kg; binds extensively to human platelets and lymphocytes (80% to 91%)

Protein binding: 80% to 91%

Metabolism: Extensively hepatic, via CYP3A4, to two metabolites, deacetylvinorelbine (active) and vinorelbine N-oxide

Bioavailability: Oral (not approved in the U. S.): 26% to 45%

Half-life elimination: Triphasic: Terminal: 28-44 hours

Excretion: Feces (46%); urine (18%, 10% to 12% as unchanged drug)

Clearance: Plasma: Mean: 0.97-1.26 L/hour/kg

Related Information

Vitamin A and Vitamin D

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(VYE ta min aye & VYE ta min dee)

U.S. Brand NamesA and D® Original [OTC]; Baza® Clear [OTC]; Sween Cream® [OTC]

Pharmacologic CategoryTopical Skin Product

Use: Labeled IndicationsTemporary relief of discomfort due to chapped skin, diaper rash, minor burns, abrasions, as well as irritations associated with ostomy skin care

Dosing: Adults**Superficial dermatologic irritation:** Topical: Apply locally with gentle massage as needed

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Pregnancy Risk FactorB

Adverse ReactionsFrequency not defined: Local: Irritation

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel: Vitamin A 1250 int. units and vitamin D 135 int. units; vitamin A 1250 int. units and vitamin D 130 int. units; vitamin A 5,000 int. units and vitamin D 400 int. units; vitamin A 10,000 int. units and vitamin D 400 int. units; vitamin A 10,000 int. units and vitamin D 5000 int. units; vitamin A 25,000 int. units and vitamin D 1000 int. units

Cream:

Sween Cream®: 2 g, 85 g, 184 g, 339 g [original]

Sween Cream®: 57 g, 142 g [fresh scent]

Sween Cream®: 57 g [fragrance free]

Ointment: 0.9 g, 5 g, 60 g, 120 g, 454 g [in lanolin-petrolatum base]

A and D® Original: 45 g, 120 g, 454 g

Baza® Clear: 50 g, 150 g, 240 g

Tablet: Vitamin A 10,000 int. units and vitamin D 400 int. units

Generic AvailableYes: Capsule, ointment

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Medication Safety Issues

Sound-alike/look-alike issues:

Aquasol® may be confused with Anusol®

Pronunciation(VYE ta min aye)

U.S. Brand NamesAquasol A®; Palmitate-A® [OTC]

Pharmacologic CategoryVitamin, Fat Soluble

Use: Labeled IndicationsTreatment and prevention of vitamin A deficiency; parenteral (I.M.) route is indicated when oral administration is not feasible or when absorption is insufficient (malabsorption syndrome)

Dosing: Adults

RDA:

Male: 1000 mcg

Female: 800 mcg

* mcg retinol equivalent (0.3 mcg retinol = 1 unit vitamin A)

Severe deficiency with xerophthalmia: Oral: 500,000 units/day for 3 days, then 50,000 units/day for 14 days, then 10,000-20,000 units/day for 2 months

Deficiency (without corneal changes): Oral: 100,000 units/day for 3 days then 50,000 units/day for 14 days

Parenteral treatment of deficiency: I.M.: **Note:** I.M. route is indicated when oral administration is not feasible or when absorption is insufficient (malabsorption syndrome): 10,000-20,000 units/day

Malabsorption syndrome (prophylaxis): Oral: 10,000-50,000 units/day of water miscible product

Dietary supplement: Oral: 4000-5000 units/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

RDA:

<1 year: 375 mcg

1-3 years: 400 mcg

4-6 years: 500 mcg*

7-10 years: 700 mcg*

>10 years: 800-1000 mcg*

* mcg retinol equivalent (0.3 mcg retinol = 1 unit vitamin A)

Vitamin A supplementation in measles (recommendation of the World Health Organization): Children: Oral: Administer as a single dose; repeat the next day and at 4 weeks for children with ophthalmologic evidence of vitamin A deficiency:

6 months to 1 year: 100,000 units

>1 year: 200,000 units

Note: Use of vitamin A in measles is recommended only for patients 6 months to 2 years of age hospitalized with measles and its complications **or** patients >6 months of age who have any of the following risk factors and who are not already receiving vitamin A: immunodeficiency, ophthalmologic evidence of vitamin A deficiency including night blindness, Bitot's spots or evidence of xerophthalmia, impaired intestinal absorption, moderate-to-severe malnutrition including that associated with eating disorders, or recent immigration from areas where high mortality rates from measles have been observed

Note: Monitor patients closely; dosages >25,000 units/kg have been associated with toxicity

Severe deficiency with xerophthalmia: Oral:

Children 1-8 years: 5000-10,000 units/kg/day for 5 days or until recovery occurs

Children >8 years: 500,000 units/day for 3 days, then 50,000 units/day for 14 days, then 10,000-20,000 units/day for 2 months

Deficiency (without corneal changes): Oral:

Infants <1 year: 100,000 units every 4-6 months

Children 1-8 years: 200,000 units every 4-6 months

Children >8 years: 100,000 units/day for 3 days then 50,000 units/day for 14 days

Parenteral treatment of deficiency: I.M.: **Note:** I.M. route is indicated when oral administration is not feasible or when absorption is insufficient (malabsorption syndrome):

Infants: 7500-15,000 units/day for 10 days

Children 1-8 years: 17,500-35,000 units/day for 10 days

Children >8 years: 100,000 units/day for 3 days, followed by 50,000 units/day for 2 weeks

Note: Follow-up therapy with an oral therapeutic multivitamin (containing additional vitamin A) is recommended:

Low Birth Weight Infants: Additional vitamin A is recommended, however, no dosage amount has been established

Children ≤8 years: 5000-10,000 units/day

Children >8 years: 10,000-20,000 units/day

Malabsorption syndrome (prophylaxis): Children >8 years and Adults: Oral: 10,000-50,000 units/day of water miscible product

Dietary supplement: Oral:

Infants up to 6 months: 1500 units/day

Children:

6 months to 3 years: 1500-2000 units/day

4-6 years: 2500 units/day

7-10 years: 3300-3500 units/day

Children >10 years: 4000-5000 units/day

Administration: I.V.**Do not give by I.V. push.**
Administration: I.V. DetailpH: 6.5-7.1
StorageProtect from light.
CompatibilityStable in fat emulsion 10%.
ContraindicationsHypersensitivity to vitamin A or any component of the formulation; hypervitaminosis A; pregnancy (dose exceeding RDA)
Warnings/Precautions

Dosage form specific issues:

- Parenteral vitamin A: In low birth weight infants, polysorbates have been associated with thrombocytopenia, renal dysfunction, hepatomegaly, cholestasis, ascites, hypotension, and metabolic acidosis (E-Ferol syndrome).

Other warnings/precautions:

- Appropriate use: Evaluate other sources of vitamin A while receiving this product; patients receiving >25,000 units/day should be closely monitored for toxicity.

Pregnancy Risk FactorA/X (dose exceeding RDA recommendation)
Pregnancy ConsiderationsExcessive use of vitamin A shortly before and during pregnancy could be harmful to babies.
LactationEnters breast milk/compatible at normal daily doses
Adverse Reactions1% to 10%:

Central nervous system: Fever, headache, irritability, lethargy, malaise, vertigo

Dermatologic: Drying or cracking of skin

Endocrine & metabolic: Hypercalcemia

Gastrointestinal: Weight loss

Ocular: Visual changes

Miscellaneous: Hypervitaminosis A

Drug Interactions

Retinoid-like Compounds: Vitamin A may enhance the adverse/toxic effect of Retinoid-like Compounds. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Vitamin A may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Reference Range1 RE = 1 retinol equivalent; 1 RE = 1 mcg retinol or 6 mcg beta-carotene; normal levels of vitamin A in serum = 80-300 units/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess knowledge/teach patient appropriate use and adverse symptoms to report. **Pregnancy risk factor A/X:** See Pregnancy Risk Factor for use cautions.

Patient EducationTake exactly as directed; do not take more than the recommended dose. Take with meals. Do not use mineral oil or other vitamin A supplements without consulting prescriber. Report persistent nausea, vomiting, or loss of appetite; excessively dry skin or lips; headache or CNS irritability; loss of hair; or vision changes. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule [softgel]: 10,000 units; 25,000 units

Injection, solution (Aquasol A®): 50,000 units/mL (2 mL) [contains polysorbate 80]

Tablet (Palmitate-A®): 5000 units, 15,000 units

Generic AvailableYes: Capsule

Mechanism of ActionNeeded for bone development, growth, visual adaptation to darkness, testicular and ovarian function, and as a cofactor in many biochemical processes

Pharmacodynamics/Kinetics

Absorption: Vitamin A in dosages **not** exceeding physiologic replacement is well absorbed after oral administration; water miscible preparations are absorbed more rapidly than oil preparations; large oral doses, conditions of fat malabsorption, low protein intake, or hepatic or pancreatic disease reduces oral absorption

Distribution: Large amounts concentrate for storage in the liver; enters breast milk

Metabolism: Conjugated with glucuronide; undergoes enterohepatic recirculation

Excretion: Feces

Pharmacotherapy Pearls1 mg = 3333 units

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsOleovitamin A

Pharmacologic CategoryVitamin

Use: Labeled IndicationsSupplement for use in the wasting syndrome in chronic renal failure, uremia, impaired metabolic functions of the kidney, dialysis; labeled for OTC use as a dietary supplement

Dosing: Adults

Dietary supplement: Oral: One tablet daily

Apatate® liquid: One teaspoonful daily, 1 hour prior to mid-day meal

Gevrabon® liquid: Two tablespoonsful (30 mL) once daily; shake well before use

Renal patients: Oral: One tablet or capsule daily between meals; take after treatment if on dialysis

Nephron FA®: Two tablets once daily, between meals

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsMay be taken with food to decrease stomach upset.

StorageIron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.** Adult preparations may contain amounts of iron which should not be used in children.

Pregnancy Risk FactorA (RDA recommended doses)

LactationEnters breast milk/compatible

Adverse ReactionsFrequency not defined.

Central nervous system: Somnolence

Dermatologic: Itching

Gastrointestinal: Bloating, constipation, diarrhea, flatulence, nausea, vomiting

Hematologic: Peripheral vascular thrombosis, polycythemia vera

Neuromuscular & skeletal: Paresthesia

Miscellaneous: Allergic reaction

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: Iron absorption is inhibited by eggs and milk.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aquasol E® may be confused with Anusol®

Pronunciation(VYE ta min ee)

U.S. Brand NamesAlph-E [OTC]; Alph-E-Mixed [OTC]; Aquasol E® [OTC]; Aquavit-E [OTC]; d-Alpha-Gems™ [OTC]; E-Gems Elite® [OTC]; E-Gems Plus® [OTC]; E-Gems® [OTC]; Ester-E™ [OTC]; Gamma E-Gems® [OTC]; Gamma-E Plus [OTC]; High Gamma Vitamin E Complete™ [OTC]; Key-E® Kaps [OTC]; Key-E® [OTC]

Pharmacologic CategoryVitamin, Fat Soluble

Use: Labeled IndicationsDietary supplement

Use: Unlabeled/InvestigationalTo reduce the risk of bronchopulmonary dysplasia or retrolental fibroplasia in infants exposed to high concentrations of oxygen; prevention and treatment of tardive dyskinesia; prevention and treatment of hemolytic anemia secondary to vitamin E deficiency

Dosing: AdultsVitamin E may be expressed as alpha-tocopherol equivalents (ATE), which refer to the biologically-active (R) stereoisomer content. Oral:

Recommended daily allowance (RDA): 15 mg; upper limit of intake should not exceed 1000 mg/day

Pregnant female:

- ≤18 years: 15 mg; upper level of intake should not exceed 800 mg/day
- 19-50 years: 15 mg; upper level of intake should not exceed 1000 mg/day

Lactating female:

- ≤18 years: 19 mg; upper level of intake should not exceed 800 mg/day
- 19-50 years: 19 mg; upper level of intake should not exceed 1000 mg/day

Vitamin E deficiency: 60-75 units/day

Prevention of vitamin E deficiency: Oral: 30 units/day

Cystic fibrosis: Oral: 100-400 units/day

Beta-thalassemia: Oral: 750 units/day

Sickle cell disease: Oral: 450 units/day

Tardive dyskinesia (unlabeled use): Oral: 1600 units/day

Superficial dermatologic irritation: Topical: Apply a thin layer over affected area.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricVitamin E may be expressed as alpha-tocopherol equivalents (ATE), which refer to the biologically-active (R) stereoisomer content. Oral:

Recommended daily allowance (RDA):

Infants (adequate intake; RDA not established):

- ≤6 months: 4 mg
- 7-12 months: 6 mg

Children:

- 1-3 years: 6 mg; upper limit of intake should not exceed 200 mg/day
- 4-8 years: 7 mg; upper limit of intake should not exceed 300 mg/day
- 9-13 years: 11 mg; upper limit of intake should not exceed 600 mg/day
- 14-18 years: 15 mg; upper limit of intake should not exceed 800 mg/day

Vitamin E deficiency:

Children (with malabsorption syndrome): 1 unit/kg/day of water miscible vitamin E (to raise plasma tocopherol concentrations to the normal range within 2 months and to maintain normal plasma concentrations)

Cystic fibrosis, beta-thalassemia may require higher daily maintenance doses:

Cystic fibrosis: Oral: 100-400 units/day

Beta-thalassemia: Oral: 750 units/day

Administration: OralSwallow capsules whole; do not crush or chew.
StorageProtect from light.
ContraindicationsHypersensitivity to vitamin E or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Vitamin K deficiency: May induce vitamin K deficiency.

Special populations:

- Low birth weight infants: Necrotizing enterocolitis has been associated with oral administration of large dosages (eg, >200 units/day) of a hyperosmolar vitamin E preparation in low birth weight infants.

Geriatric ConsiderationsElderly may have vitamin E prescribed for those with cardiovascular disease. Elderly should be advised not to take more than prescribed.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
LactationEnters breast milk/compatible
Adverse ReactionsFrequency not defined.

Central nervous system: Fatigue, headache

Dermatologic: Contact dermatitis with topical preparation

Endocrine & metabolic: Gonadal dysfunction

Gastrointestinal: Diarrhea, intestinal cramps, nausea

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision

Drug Interactions

Vitamin K Antagonists (eg, warfarin): Vitamin E may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring ParametersPlasma tocopherol concentrations (normal range: 6-14 mcg/mL)
Reference RangeTherapeutic: 0.8-1.5 mg/dL (SI: 19-35 µmol/L), some method variation
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess knowledge/teach patient appropriate use (according to formulation prescribed) and adverse symptoms to report.
Monitoring: Lab TestsPlasma tocopherol concentrations (normal range: 6-14 mcg/mL)
Patient EducationTake exactly as directed; do not take more than the recommended dose. Do not use mineral oil or other vitamin E supplements without consulting prescriber. Report persistent nausea, vomiting, or cramping; or gonadal dysfunction. **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 400 int. units, 1000 int. units

Key-E® Kaps: 200 int. units, 400 int. units

Capsule, softgel: 200 int. units, 400 int. units, 600 int. units, 1000 int. units

Alph-E: 200 int. units, 400 int. units

Alph-E-Mixed: 200 int. units [contains mixed tocopherols]; 400 int. units [contains mixed tocopherols], 1000 int. units [sugar free; contains mixed tocopherols]

Aqua Gem E®: 200 units, 400 units

d-Alpha-Gems™: 400 int. units [derived from soybean oil]

E-Gems®: 30 int. units, 100 int. units, 200 int. units, 400 int. units, 600 int. units, 800 int. units, 1000 int. units, 1200 int. units [derived from soybean oil]

E-Gems Plus®: 200 int. units, 400 int. units, 800 int. units [contains mixed tocopherols]

E-Gems Elite®: 400 int. units [contains mixed tocopherols]

Ester-E™: 400 int. units

Gamma E-Gems®: 90 int. units [also contains mixed tocopherols]

Gamma-E Plus: 200 int. units [contains soybean oil]

High Gamma Vitamin E Complete™: 200 int. units [contains soybean oil, mixed tocopherols]

Cream: 50 int. units/g (60 g), 100 int. units/g (60 g), 1000 int. units/120 g (120 g), 30,000 int. units/57 g (57 g)

Key-E®: 30 int. units/g (60 g, 120 g, 600 g)

Lip balm (E-Gem® Lip Care): 1000 int. units/tube [contains vitamin A and aloe]

Oil, oral/topical: 100 int. units/0.25 mL (60 mL, 75 mL); 1150 units/0.25 mL (30 mL, 60 mL, 120 mL); 28,000 int. units/30 mL (30 mL)

Alph-E: 28,000 int. units/30 mL (30 mL) [topical]

E-Gems®: 100 units/10 drops (15 mL, 60 mL)

Ointment, topical (Key-E®): 30 units/g (60 g, 120 g, 480 g)

Powder (Key-E®): 700 int. units per 1/4 teaspoon (15 g, 75 g, 1000 g) [derived from soybean oil]

Solution, oral drops: 15 int. units/0.3 mL (30 mL)

Aquasol E®: 15 int. units/0.3 mL (12 mL, 30 mL) [latex free]

Aquavit-E: 15 int. units/0.3 mL (30 mL) [butterscotch flavor]

Suppository, rectal/vaginal (Key-E®): 30 int. units (12s, 24s) [contains coconut oil]

Tablet: 100 int. units, 200 int. units, 400 int. units, 500 int. units

Key-E®: 200 int. units, 400 int. units

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Vitamin E)

1000 unit (30): $8.99

Mechanism of ActionPrevents oxidation of vitamin A and C; protects polyunsaturated fatty acids in membranes from attack by free radicals and protects red blood cells against hemolysis

Pharmacodynamics/Kinetics

Absorption: Oral: Depends on presence of bile; reduced in conditions of malabsorption, in low birth weight premature infants, and as dosage increases; water miscible preparations are better absorbed than oil preparations

Distribution: To all body tissues, especially adipose tissue, where it is stored

Metabolism: Hepatic to glucuronides

Excretion: Feces

Pharmacotherapy PearlsThe 2R-stereoisomeric forms of α-tocopherol are used to define vitamin E intake and RDA. While international units are no longer recognized, many fortified foods and supplements continue to use this term although USP units are now used by the pharmaceutical industry when labeling vitamin E supplements. Both IUs and USP units are based on the same equivalency. The following can be used to convert international units (IU) of vitamin E (and esters) to milligrams α-tocopherol in order to meet recommended daily intake:

Synthetic (eg, all-racemic α-tocopherol):

dl-α-tocopherol:

USP: 1.10 IU / mg; 0.91 mg / IU

Molar: 2.12 µmol / IU

α-tocopherol: 0.45 mg / IU

dl-α-tocopherol acetate:

USP: 1 IU / mg; 1 mg / IU

Molar: 2.12 µmol / IU

α-tocopherol: 0.45 mg / IU

dl-α-tocopherol succinate:

USP: 0.89 IU / mg; 1.12 mg / IU

Molar: 2.12 µmol / IU

α-tocopherol: 0.45 mg / IU

Natural (eg, RRR-α-tocopherol):

d-α-tocopherol:

USP: 1.49 IU / mg; 0.67 mg / IU

Molar: 1.56 µmol / IU

α-tocopherol: 0.67 mg / IU

d-α-tocopherol acetate:

USP: 1.36 IU / mg; 0.74mg / IU

Molar: 1.56 µmol / IU

α-tocopherol: 0.67 mg / IU

d-α-tocopherol succinate:

USP: 1.21 IU / mg; 0.83 mg / IU

Molar: 1.56 µmol / IU

α-tocopherol: 0.67 mg / IU

Historically, vitamin E supplements have been labeled (incorrectly) as *d*- or *dl*-α-tocopherol. Synthetic vitamin E compounds are racemic mixtures, and may be designated as all-racemic (all rac-α-tocopherol). The natural form contains the only RRR-α-tocopherol. All of these compounds may be present in fortified foods and multivitamins. Not all stereoisomers are capable of performing physiological functions in humans; therefore, cannot be considered to meet vitamin E requirements.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause drowsiness

Mental Health: Effects on Psychiatric TreatmentUsed to prevent or treat tardive dyskinesia and Alzheimer's disease

Cardiovascular ConsiderationsThere is no compelling evidence that supplemental antioxidant therapy has a role in the primary or secondary prevention of cardiovascular disease. The ACC/AHA guidelines for the management of patients with chronic stable angina and the 2004 ACC/AHA STEMI guidelines do not recommend the use of vitamin E. The HOPE trial evaluated the use of vitamin E (400 int. units/day) in patients at high risk for cardiovascular events. There was no difference from placebo for the composite endpoint of cardiovascular death, MI, or stroke. In another trial (Brown, 2001), a daily antioxidant cocktail (vitamin E 800 int. units, vitamin C 1000 mg, beta carotene 25 mg, selenium 100 mcg) was evaluated in patients with coronary disease, low HDL, and normal LDL cholesterol. The protective increase in HDL2 with simvastatin plus niacin was attenuated by this concurrent antioxidant therapy. Progression of coronary stenosis occurred on average in patients taking niacin, simvastatin, and antioxidants compared to regression in those randomized to niacin and simvastatin alone. Patients should be encouraged to follow the Therapeutic Lifestyle Changes Diet (NCEP Expert Panel, 2001)

Index Terms*d*-Alpha Tocopherol; *dl*-Alpha Tocopherol

Pronunciation(VYE ta mins, MUL ti pul/in JEK ti bal)

U.S. Brand NamesInfuvite® Adult; Infuvite® Pediatric; M.V.I. Adult™; M.V.I.®-12 ; M.V.I® Pediatric

Pharmacologic CategoryVitamin

Use: Labeled IndicationsNutritional supplement in patients receiving parenteral nutrition or requiring intravenous administration

Dosing: Adults**Dietary supplement:** I.V. (not for direct infusion): Adult formulation: 10 mL/day added to TPN or ≥500 mL of appropriate solution

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Dietary supplement:** I.V. (not for direct infusion):

Children: ≥3 kg to 11 years: Pediatric formulation: 5 mL/day added to TPN or ≥100 mL of appropriate solution

Children >11 years and Adults: Refer to adult dosing.

Administration: I.V.Not for direct infusion; solution must be diluted prior to administration.

StorageStore injection at 2°C to 8°C (36°F to 46°F). Some components are light sensitive.

Powder for injection: Solution is stable for 4 hours prior to final dilution.

Solution: Once combined, solution should be immediately added to infusion solution.

Reconstitution

Powder for injection: M.V.I.® Pediatric: Add 5 mL SWFI, D_5W, or NS to vial; swirl gently to dissolve. Must be further diluted prior to administration.

Solution: Infuvite® Adult, Infuvite® Pediatric, M.V.I.®-12: Solution is provided as two separate vials which need combined to provide the usual daily dose following further dilution.

Compatibility**Incompatible** with alkaline solutions/medications (eg, acetazolamide, chlorothiazide, aminophylline, or bicarbonate), ampicillin, calcium salts, tetracyclines, or fat emulsions.

ContraindicationsHypersensitivity to any component of the formulation; pre-existing hypervitaminosis

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Megaloblastic anemia: Should not be used prior to testing for megaloblastic anemia.
- Renal impairment: Use with caution in patients with severe renal impairment.

Special populations:

- Pediatrics: Additional vitamin A may be required in pediatric patients.

Dosage form specific issues:

- Aluminum: Some formulations contain aluminum which may reach toxic levels with prolonged administration in renal impairment or immaturity.
- Polysorbates: Some formulations may contain polysorbates which have been associated with the E-Ferol syndrome in low birth weight infants.

Other warnings/precautions:

- RDA values: Are not requirements, but are recommended daily intakes of certain essential nutrients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

Adverse ReactionsFrequency not defined.

Cardiovascular: Angioedema, edema

Central nervous system: Agitation, anxiety, dizziness, headache

Dermatologic: Erythema, pruritus, rash, urticaria

Ocular: Diplopia

Respiratory: Dyspnea, wheezing

Miscellaneous: Allergic reactions, anaphylaxis, hypervitaminosis

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Content varies depending on product used. For more detailed information on ingredients in these and other multivitamins, please refer to Multivitamin Products.

Pharmacologic CategoryVitamin

Use: Labeled IndicationsPrevention/treatment of vitamin and mineral deficiencies; labeled for OTC use as a dietary supplement

Dosing: Adults**Dietary supplement:** Oral: Daily dose of adult preparations varies by product. Generally, 1 tablet or capsule or 5-15 mL of liquid per day. Consult package labeling. Prescription doses may be higher for burn or cystic fibrosis patients.

Dosing: ElderlyRefer to adult dosing.

Administration: OralMay administer with food to decrease stomach upset.

Dietary ConsiderationsMay be taken with food to decrease stomach upset.

StorageIron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.

ContraindicationsHypersensitivity to any component of the formulation; pre-existing hypervitaminosis

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.** Adult preparations may contain amounts of iron which should not be used in children.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Renal impairment: Use with caution in patients with severe renal impairment.

Dosage form specific issues:

- Ethanol: Adult preparations may contain amounts of ethanol which should not be used in children.

Other warnings/precautions:

- RDA values: Are not requirements, but are recommended daily intakes of certain essential nutrients.

Pregnancy Risk FactorA (at RDA recommended dose)

LactationEnters breast milk/compatible

Adverse ReactionsRefer to individual vitamin monographs.

Ethanol/Nutrition/Herb InteractionsFood: Iron absorption is inhibited by eggs and milk.

Test InteractionsAscorbic acid in the urine can cause false-negative urine glucose determinations.

Reference RangeRecommended daily allowances are published by Food and Nutrition Board, National Research Council - National Academy of Sciences and are revised periodically. RDA quantities apply only to healthy persons and are not intended to cover therapeutic nutrition requirements in disease or other abnormal states (ie, metabolic disorders, weight reduction, chronic disease, drug therapy).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Content varies depending on product used. For more detailed information on ingredients in these and other multivitamins, please refer to Multivitamin Products.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Niferex® may be confused with Nephrox®

PreCare® may be confused with Precose®

Pronunciation(VYE ta mins, MUL ti pul/pree NAY tal)

U.S. Brand NamesA-Free Prenatal; Advanced NatalCare®; Advanced-RF NatalCare®; Cal-Nate™; Calna [OTC]; CareNatal™ DHA; CitraNatal™ 90 DHA; CitraNatal™ DHA; CitraNatal™ Rx; ComBi Rx™; Duet®; Duet® DHA; Duet® DHA ^{ec}; KPN Prenatal [OTC]; Mini-Prenatal [OTC]; NataCaps™; NataChew® [OTC]; NataFort® [OTC]; NatalCare® GlossTabs™; NatalCare® PIC; NatalCare® PIC Forte; NatalCare® Plus; NatalCare® Rx; NatalCare® Three; NataTab™ CFe; NataTab™ FA; NataTab™ Rx; NutriNate®; NutriSpire™; One A Day® Women's Prenatal [OTC]; OptiNate®; PreCare Conceive®; PreCare Premier®; PreCare®; PremesisRx®; Prenatal 19 [OTC]; Prenatal AD [OTC]; Prenatal MR 90 Fe™; Prenatal MTR With Selenium; Prenatal One Daily [OTC]; Prenatal Rx 1; Prenatal U [OTC]; Prenatal Z Advanced Formula; Prenate DHA™; Prenate Elite®; PrimaCare®; PrimaCare® One; Select-OB™ [OTC]; Stuart Prenatal® [OTC]; Tandem® DHA; Tandem® OB; Trinate [OTC]; Ultra NatalCare®; Vitafol®-OB [OTC]; Vitafol®-OB+DHA [OTC]; Vitafol®-PN

Pharmacologic CategoryVitamin

Use: Labeled IndicationsNutritional supplement for use prior to conception, during pregnancy, and postnatal (in lactating and nonlactating women)

Dosing: Adults**Dietary supplement:** Oral:

Capsule, tablet: One daily

Powder: 4 teaspoonfuls/day; given once daily or in divided doses; mix 1 teaspoonful in 1 ounce of water

Dosing: ElderlyRefer to adult dosing.

Administration: OralMay administer with food to decrease stomach upset.

Dietary ConsiderationsMay be taken with food to decrease stomach upset. Obegyn® powder contains phenylalanine 84 mg/8.25 g. Duet® contains phenylalanine 15 mg/chewable tablet. StrongStart™ contains phenylalanine 6 mg/chewable tablet.

ContraindicationsHypersensitivity to any component of the formulation; pre-existing hypervitaminosis

Warnings/Precautions

Boxed warnings:

- Iron toxicity: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Iron toxicity: **[U.S. Boxed Warning]: Severe iron toxicity may occur in overdose, particularly when ingested by children; iron is a leading cause of fatal poisoning in children; store out of children's reach and in child-resistant containers.** Adult preparations may contain amounts of iron which should not be used in children.

Disease-related concerns:

- Hemochromatosis/hemosiderosis: Iron supplementation should not be used with hemochromatosis and hemosiderosis.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Kidney stones: Use with caution in patients with kidney stones; due to calcium content.
- Renal impairment: Use with caution in patients with severe renal impairment.

Pregnancy Risk FactorA (in RDA recommended dose)

LactationEnters breast milk/compatible

Adverse ReactionsFrequency not defined.

Gastrointestinal: Abdominal pain, constipation, dark stools, diarrhea, nausea, vomiting

Miscellaneous: Allergic reaction

Ethanol/Nutrition/Herb InteractionsFood: Iron absorption is inhibited by eggs and milk.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Content varies depending on product used. For more detailed information on ingredients in these and other multivitamins, please refer to

Multivitamin Products.

Variation 1:

Mitomycin: I.V.: 10 mg/m^2 days 1 and 28, for 2 cycles

[total dose/cycle = 20 mg/m^2]

followed by I.V.: 10 mg/m^2 day 1 only for subsequent cycles

[total dose/cycle = 10 mg/m^2]

Vinblastine: I.V.: 5 mg/m^2/day days 1, 14, 28, and 42, for 2 cycles

[total dose/cycle = 20 mg/m^2]

followed by I.V.: 5 mg/m^2/day days 1 and 21

[total dose/cycle = 10 mg/m^2]

Repeat cycle every 6-8 weeks

Variation 2:

Mitomycin: I.V.: 10 mg/m^2/day days 1 and 28, for 2 cycles

[total dose/cycle = 20 mg/m^2]

followed by I.V.: 10 mg/m^2 day 1 only for subsequent cycles

[total dose/cycle = 10 mg/m^2]

Vindesine: I.V.: 2 mg/m^2/day days 1, 14, 28, and 42, for 2 cycles

[total dose/cycle = 8 mg/m^2]

followed by I.V.: 2 mg/m^2/ day days 1 and 21 for subsequent cycles

[total dose/cycle = 4 mg/m^2]

Repeat cycle every 6-8 weeks

U.S. Brand NamesVFEND®

Canadian Brand NamesVFEND®

Pharmacologic CategoryAntifungal Agent, Oral; Antifungal Agent, Parenteral

Use: Labeled IndicationsTreatment of invasive aspergillosis; treatment of esophageal candidiasis; treatment of candidemia (in non-neutropenic patients); treatment of disseminated *Candida* infections of the skin and viscera; treatment of serious fungal infections caused by *Scedosporium apiospermum* and *Fusarium* spp (including *Fusarium solani*) in patients intolerant of, or refractory to, other therapy

Use: Unlabeled/Investigational

Fungal infection prophylaxis in intermediate or high risk neutropenic cancer patients with myelodysplastic syndrome (MDS) or acute myelogenous leukemia (AML), neutropenic allogeneic hematopoietic stem cell recipients, and patients with significant graft-versus-host disease; empiric antifungal therapy (second-line) for persistent neutropenic fever

Dosing: Adults

Aspergillosis, invasive, including disseminated and extrapulmonary infection: Duration of therapy should be a minimum of 6-12 weeks or throughout period of immunosuppression:

I.V.: Initial: Loading dose: 6 mg/kg every 12 hours for 2 doses; followed by maintenance dose of 4 mg/kg every 12 hours

Oral: May consider oral therapy in place of I.V. with dosing of 4 mg/kg (rounded up to convenient tablet dosage form) every 12 hours; however, I.V. administration is preferred in serious infections since comparative efficacy with the oral formulation has not been established.

Scedosporiosis, fusariosis: I.V.: Initial: Loading dose: 6 mg/kg every 12 hours for 2 doses; followed by maintenance dose of 4 mg/kg every 12 hours

Candidemia and other deep tissue *Candida*infections: I.V.: Initial: Loading dose 6 mg/kg every 12 hours for 2 doses; followed by maintenance dose of 3-4 mg/kg every 12 hours

Endophthalmitis, fungal: I.V.: 6 mg/kg every 12 hours for 2 doses, then 200 mg orally twice daily

Esophageal candidiasis: Oral:

Patients <40 kg: 100 mg every 12 hours; maximum: 300 mg/day

Patients ≥40 kg: 200 mg every 12 hours; maximum: 600 mg/day

Note: Treatment should continue for a minimum of 14 days, and for at least 7 days following resolution of symptoms.

Conversion to oral dosing:

Patients <40 kg: 100 mg every 12 hours; increase to 150 mg every 12 hours in patients who fail to respond adequately

Patients ≥40 kg: 200 mg every 12 hours; increase to 300 mg every 12 hours in patients who fail to respond adequately

Dosage adjustment in patients unable to tolerate treatment:

I.V.: Dose may be reduced to 3 mg/kg every 12 hours

Oral: Dose may be reduced in 50 mg decrements to a minimum dosage of 200 mg every 12 hours in patients weighing ≥40 kg (100 mg every 12 hours in patients <40 kg)

Dosage adjustment in patients receiving concomitant CYP450 enzyme inducers or substrates:

Cyclosporine: Reduce cyclosporine dose by $^1/_2$ and monitor closely.

Efavirenz: Oral: Increase maintenance dose of voriconazole to 400 mg every 12 hours and reduce efavirenz dose to 300 mg once daily

Phenytoin:

I.V.: Increase maintenance dosage to 5 mg/kg every 12 hours

Oral: Increase dose to 400 mg every 12 hours in patients ≥40 kg (200 mg every 12 hours in patients <40 kg)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Children <12 years: No data available

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentIn patients with Cl_{cr} <50 mL/minute, accumulation of the intravenous vehicle (SBECD) occurs. After initial I.V. loading dose, oral voriconazole should be administered to these patients, unless an assessment of the benefit:risk to the patient justifies the use of I.V. voriconazole. Monitor serum creatinine and change to oral voriconazole therapy when possible.

Hemodialysis: Oral dosage adjustment not required; I.V. dosing not recommended since SBECD vehicle is cleared at half the rate of voriconazole and may accumulate

Dosing: Hepatic Impairment

Mild-to-moderate hepatic dysfunction (Child-Pugh class A and B): Following standard loading dose, reduce maintenance dosage by 50%

Severe hepatic impairment: Should only be used if benefit outweighs risk; monitor closely for toxicity

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Infuse over 1-2 hours (rate not to exceed 3 mg/kg/hour). Do not infuse concomitantly into same line or cannula with other drug infusions, including TPN.

Administration: OralAdminister 1 hour before or 1 hour after a meal.

Dietary ConsiderationsOral: Should be taken 1 hour before or 1 hour after a meal. Voriconazole tablets contain lactose; avoid administration in hereditary galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption. Suspension contains sucrose; use caution with fructose intolerance, sucrose-isomaltase deficiency, or glucose-galactose malabsorption.

Storage

Powder for injection: Store at 15°C to 30°C (59°F to 86°F). Reconstituted solutions are stable for up to 24 hours under refrigeration at 2°C to 8°C (36°F to 46°F).

Powder for oral suspension: Store at 2°C to 8°C (36°F to 46°F). Reconstituted oral suspension may be stored at 15°C to 30°C (59°F to 86°F).

Tablets: Store at 15°C to 30°C (59°F to 86°F).

Reconstitution

Powder for injection: Reconstitute 200 mg vial with 19 mL of sterile water for injection (use of automated syringe is not recommended). Resultant solution (20 mL) has a concentration of 10 mg/mL. Prior to infusion, must dilute to 0.5-5 mg/mL with NS, LR, D_5WLR, $D_5W^1/_2$NS, D_5W, D_5W with KCl 20 mEq, $^1/_2$NS, or D_5WNS. Do not dilute with 4.2% sodium bicarbonate infusion.

Powder for oral suspension: Add 46 mL of water to the bottle to make 40 mg/mL suspension. Discard unused portion after 14 days.

CompatibilityStable in NS, LR, D_5WLR, $D_5W^1/_2$NS, D_5W, D_5W with KCl 20 mEq, $^1/_2$NS, or D_5WNS. Do not infuse **concomitantly** into same line or cannula with other drug infusions, including TPN. May be infused simultaneously with TPN through a separate I.V. line.

Incompatible: Do not infuse simultaneously with blood products.

ContraindicationsHypersensitivity to voriconazole or any component of the formulation (cross-reaction with other azole antifungal agents may occur but has not been established, use caution); coadministration of CYP3A4 substrates which may lead to QT_c prolongation (cisapride, pimozide, or quinidine); coadministration with barbiturates (long acting), carbamazepine, efavirenz (with standard [eg, not adjusted] voriconazole and efavirenz doses), ergot derivatives, rifampin, rifabutin, ritonavir (≥800 mg/day), sirolimus, St John’s wort

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias/QT prolongation: QT interval prolongation has been associated with voriconazole use; rare cases of arrhythmia (including torsade de pointes), cardiac arrest, and sudden death have been reported, usually in seriously ill patients with comorbidities and/or risk factors (eg, prior cardiotoxic chemotherapy, cardiomyopathy, electrolyte imbalance, or concomitant QT_c-prolonging drugs). Use with caution in these patient populations; correct electrolyte abnormalities (eg, hypokalemia, hypomagnesemia, hypocalcemia) prior to initiating therapy.

- Dermatologic reactions: Rarely, serious cutaneous reactions, including Stevens-Johnson syndrome have been reported with treatment. Consider discontinuing in patients developing a rash. Avoid strong, direct exposure to sunlight; may cause photosensitivity, especially with long-term use.

- Hallucinations: Visual and/or auditory hallucinations have been observed. Possibly dependent on serum concentrations and may be more common with the I.V. formulation.

- Ocular effects: Visual changes, including blurred vision, changes in visual acuity, color perception, and photophobia, are commonly associated with treatment. Patients should be warned to avoid tasks which depend on vision, including operating machinery or driving. Changes are reversible on discontinuation following brief exposure/treatment regimens (≤28 days); reversibility following long-term administration has not been evaluated.

Disease-related concerns:

- Hepatic impairment: Serious (and rarely fatal) hepatic toxicity (eg, hepatitis, cholestasis, fulminant failure) has been observed with azole therapy. Use with caution in patients with pre-existing hepatic impairment; monitor liver function closely and dosage adjustment or discontinuation may be warranted.

- Pancreatitis: Monitor pancreatic function in patients (children and adults) at risk for acute pancreatitis (eg, recent chemotherapy or hematopoietic stem cell transplantation). There have been postmarketing reports of pancreatitis in children.

- Renal impairment: Avoid the use of I.V. voriconazole in patients with renal impairment. See “Dosage forms specific issues: Injectable” below. Acute renal failure has been observed in severely ill patients; use with caution in patients receiving concomitant nephrotoxic medications.

Concurrent drug therapy issues:

- High potential for interactions: Use caution in patients taking strong cytochrome P450 inducers, CYP2C9 inhibitors, and major 3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Injectable: Avoid/limit use of intravenous formulation in patients with renal impairment; intravenous formulation contains excipient sulfobutyl ether beta-cyclodextrin (SBECD), which may accumulate in renal insufficiency. Anaphylactoid-type infusion-related reactions may occur with intravenous dosing. Consider discontinuation of infusion if reaction is severe. Do not infuse concomitantly with blood products or short-term concentrated electrolyte solutions, even if the two infusions are running in separate intravenous lines (or cannulas).

- Lactose: Tablets contain lactose; avoid administration in hereditary galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption.

- Sucrose: Suspension contains sucrose; use caution with fructose intolerance, sucrose-isomaltase deficiency, or glucose-galactose malabsorption.

Geriatric ConsiderationsThe manufacturer reports that median voriconazole plasma concentrations were increased in patients 65 years and older compared to those 65 years and younger. The recommendation that a dose adjustment is not needed for the elderly was based on a similar safety profile between young and older patients.

Pregnancy Risk FactorD

Pregnancy ConsiderationsVoriconazole can cause fetal harm when administered to a pregnant woman. Voriconazole was teratogenic and embryotoxic in animal studies, and lowered plasma estradiol in animal models. Women of childbearing potential should use effective contraception during treatment. Should be used in pregnant woman only if benefit to mother justifies potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsExcretion in breast milk has not been investigated; avoid breast-feeding until additional data are available.

Adverse Reactions

>10%:

Central nervous system: Hallucinations (4% to 12%; auditory and/or visual and likely serum concentration-dependent)

Ocular: Visual changes (dose related; photophobia, color changes, increased or decreased visual acuity, or blurred vision occur in ~21%)

Renal: Creatinine increased (1% to 21%)

2% to 10%:

Cardiovascular: Tachycardia (≤2%)

Central nervous system: Fever (≤6%), chills (≤4%), headache (≤3%)

Dermatologic: Rash (≤7%)

Endocrine & metabolic: Hypokalemia (≤2%)

Gastrointestinal: Nausea (1% to 5%), vomiting (1% to 4%)

Hepatic: Alkaline phosphatase increased (4% to 5%), AST increased (2% to 4%), ALT increased (2% to 3%), cholestatic jaundice (1% to 2%)

Ocular: Photophobia (2% to 3%)

<2% (Limited to important or life-threatening): Acute tubular necrosis, adrenal cortical insufficiency, agranulocytosis, allergic reaction, alopecia, anaphylactoid reaction, anemia (aplastic, hemolytic, macrocytic, megaloblastic, or microcytic), angioedema, anuria, ascites, ataxia, atrial arrhythmia, atrial fibrillation, AV block, bigeminy, bleeding time increased, bone marrow depression, bone necrosis, bradycardia, brain edema, bundle branch block, BUN increased, cardiac arrest, cardiomegaly, cardiomyopathy, cerebral hemorrhage, cerebral ischemia, cerebrovascular accident, chest pain, CHF, cholecystitis, cholelithiasis, chromatopsia, color blindness, coma, confusion, cyanosis, delirium, dementia, depersonalization, depression, diabetes insipidus, diarrhea, DIC, discoid lupus erythematosus, duodenal ulcer perforation, DVT, dyspnea, edema, encephalopathy, endocarditis, eosinophilia, erythema multiforme, exfoliative dermatitis, extrapyramidal symptoms, fixed drug eruption, fulminant hepatic failure, gastrointestinal hemorrhage, GGT/LDH increased, glucose tolerance decreased, grand mal seizure, Guillain-Barré syndrome, hematemesis, hepatic coma, hepatic failure, hepatitis, hepatomegaly, hydronephrosis, hyperbilirubinemia, hypercholesterolemia, hyper-/hypocalcemia, hyper-/hypoglycemia, hyper-/hypomagnesemia, hyper-/hyponatremia, hyper-/hypotension, hyper-/hypothyroidism, hyperkalemia, hyperuricemia, hypophosphatemia, hypoxia, intestinal perforation, intracranial hypertension, jaundice, leukopenia, liver enlarged, lung edema, lymphadenopathy, lymphangitis, maculopapular rash, MI, multiorgan failure, myasthenia, myopathy, nephritis, nephrosis, neuropathy, night blindness, nodal arrhythmia, oculogyric crisis, optic atrophy, optic neuritis, osteomalacia, osteoporosis, palpitation, pancreatitis, pancytopenia, papilledema, paresthesia, peripheral edema, peritonitis, petechia, photosensitivity, pleural effusion, postural hypotension, pruritus, pseudomembraneous colitis, psychosis, pulmonary embolus, purpura, QT interval prolongation, renal dysfunction, renal failure (acute), respiratory distress syndrome, retinal hemorrhage, seizure, sepsis, somnolence, spleen enlarged, Stevens-Johnson syndrome, substernal chest pain, suicidal ideation,

supraventricular extrasystoles, supraventricular tachycardia, syncope, thrombocytopenia, thrombophlebitis, thrombotic thrombocytopenic purpura, tongue edema, torsade de pointes, toxic epidermal necrolysis, uremia, urinary retention, urticaria, uveitis, vasodilation, ventricular arrhythmia, ventricular fibrillation, ventricular tachycardia, visual field defect

Metabolism/Transport Effects **Substrate** of CYP2C9 (major), 2C19 (major), 3A4 (minor); **Inhibits** CYP2C9 (weak), 2C19 (weak), 3A4 (moderate)

Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amphotericin B: Antifungal Agents (Azole Derivatives, Systemic) may diminish the therapeutic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Voriconazole. **Exceptions:** Methohexital; PENTobarbital; Secobarbital; Thiopental. *Risk X: Avoid combination*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Cardiac Glycosides: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cinacalcet: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cinacalcet. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Diclofenac: Voriconazole may increase the serum concentration of Diclofenac. *Risk D: Consider therapy modification*

Didanosine: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). Enteric coated didanosine capsules are not expected to affect these antifungals. *Risk D: Consider therapy modification*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Ergot Derivatives: Voriconazole may increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Grapefruit Juice: May increase the metabolism of Antifungal Agents (Azole Derivatives, Systemic). This specifically applies to oral antifungal administration. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Lopinavir: May decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Voriconazole may decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): Voriconazole may decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Phenytoin: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Reverse Transcriptase Inhibitors (Non-Nucleoside): May decrease the serum concentration of Voriconazole. Voriconazole may increase the serum concentration of Reverse Transcriptase Inhibitors (Non-Nucleoside). Management: Efavirenz and voriconazole should not be coadministered at standard doses. Concurrent therapy is acceptable if voriconazole is dosed at 400 mg every 12 hours and efavirenz is dosed at 300 mg daily throughout the course of therapy. **Exceptions:** Delavirdine; Etravirine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: Voriconazole may increase the serum concentration of Rifamycin Derivatives. Rifamycin Derivatives may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Rifamycin Derivatives: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Ritonavir: May increase the metabolism of Voriconazole. High-dose ritonavir (400 mg every 12 hours) is contraindicated. Use caution with lower doses. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Sucralfate: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

Venlafaxine: Voriconazole may enhance the adverse/toxic effect of Venlafaxine. Voriconazole may increase the serum concentration of Venlafaxine. *Risk C: Monitor therapy*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Voriconazole may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Zolpidem: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Zolpidem. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: May decrease voriconazole absorption. Voriconazole should be taken 1 hour before or 1 hour after a meal. Avoid grapefruit juice (may decrease voriconazole levels).

Herb/Nutraceutical: St John's wort may decrease voriconazole levels; concurrent use with voriconazole is contraindicated.

Monitoring ParametersHepatic function at initiation and during course of treatment; renal function; serum electrolytes (particularly calcium, magnesium and potassium) prior to therapy initiation; visual function (visual acuity, visual field and color perception) if treatment course continues >28 days; may consider obtaining voriconazole trough level in patients failing therapy or exhibiting signs of toxicity; pancreatic function (in patients at risk for acute pancreatitis)

Nursing: Physical Assessment/MonitoringEvaluate hepatic function, renal function, and allergy history prior to beginning therapy. Assess all other pharmacological or herbal products patient may be taking for potential interactions or toxicity. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response (eg, vision changes [photophobia, changed visual acuity, blurred vision], hepatic toxicity [increased liver enzymes, jaundice], tachycardia, dermatologic reactions) on a regular basis. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsHepatic function at initiation and during course of treatment; renal function; serum electrolytes (particularly calcium, magnesium and potassium) prior to therapy initiation; may consider obtaining voriconazole trough level in patients failing therapy or exhibiting signs of toxicity; pancreatic function (in patients at risk for acute pancreatitis)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. **I.V.:** You will be monitored during intravenous administration; report immediately any pain, swelling, redness at infusion site, difficulty breathing or swallowing, back pain, itching, or other adverse effects. **Oral:** Take full course of medication as ordered. Preferable to take on empty stomach 1 hour before or 1 hour after a meal. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience headache, dizziness, blurred vision, photophobia, or changes in visual acuity (use caution when driving or engaging in tasks that require alertness until response to drug is known; vision changes are reversible shortly after treatment is completed or discontinued); nausea, vomiting, or abdominal pain (small frequent meals, frequent mouth care, sucking lozenges, chewing gum may help). Report immediately any change in vision. Report unusual tiredness, flu-like feelings, skin rash or itching, dark urine, light colored stool, yellowing of skin or eyes; fever; chest pain or rapid heartbeat; or any other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this drug. Fetal harm can occur. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 200 mg [contains SBECD 3200 mg]

Powder for oral suspension: 200 mg/5 mL (70 mL) [contains sodium benzoate and sucrose; orange flavor]

Tablet: 50 mg, 200 mg [contains lactose]

Generic AvailableNo

ManufacturerPfizer Inc

Mechanism of ActionInterferes with fungal cytochrome P450 activity (selectively inhibits 14-alpha-lanosterol demethylation), decreasing ergosterol synthesis (principal sterol in fungal cell membrane) and inhibiting fungal cell membrane formation.

Pharmacodynamics/Kinetics

Absorption: Well absorbed after oral administration; administration of crushed tablets is considered bioequivalent to whole tablets

Distribution: V_d: 4.6 L/kg

Protein binding: 58%

Metabolism: Hepatic, via CYP2C19 (major pathway) and CYP2C9 and CYP3A4 (less significant); saturable (may demonstrate nonlinearity)

Bioavailability: 96%

Half-life elimination: Variable, dose-dependent

Time to peak: Oral: 1-2 hours; 0.5 hours (crushed tablet)

Excretion: Urine (as inactive metabolites; <2% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsVoriconazole is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause abnormal dreams, agitation, amnesia, anxiety, confusion, delirium, dementia, depersonalization, depression, dizziness, encephalopathy, euphoria, insomnia, psychosis, somnolence, suicidal ideation

Mental Health: Effects on Psychiatric TreatmentContraindicated with CYP3A4 substrates which may lead to QT_c prolongation (pimozide); coadministration with barbiturates (long acting), carbamazepine, and ergot alkaloids. Blurred vision is common; use caution with anticholinergic agents. Concurrent use with benzodiazepines that are oxidatively metabolized (alprazolam, diazepam, temazepam, triazolam, and midazolam) may result in elevated benzodiazepine serum concentrations and potential risk for toxicity. Buspirone and zolpidem serum concentrations may be increased with concurrent use. St John's wort may decrease voriconazole levels; monitor.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Based on high oral bioavailability, switching between I.V. and oral administration is appropriate when clinically indicated. Infusions of blood products and any electrolyte supplementation must not occur simultaneously with intravenous voriconazole. Voriconazole I.V. must not be infused into the same line or cannula concomitantly with other drug infusions.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(vor IN oh stat)
U.S. Brand NamesZolinza™
Pharmacologic CategoryAntineoplastic Agent, Histone Deacetylase Inhibitor
Use: Labeled IndicationsTreatment of progressive, persistent, or recurrent cutaneous T-cell lymphoma (CTCL)
Dosing: Adults**Cutaneous T-cell lymphoma:** Oral: 400 mg once daily

In clinical trials, treatment was withheld for grade 4 anemia or thrombocytopenia or other grade 3 or 4 drug related toxicity, until resolved to ≤ grade 1. Therapy was reinitiated with dose modification (Olsen, 2007).

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNot studied, however, based on the minimal renal elimination, adjustment may not be required.
Dosing: Hepatic ImpairmentNot studied; use caution based on predominant hepatic metabolism.
Dosing: Adjustment for ToxicityIntolerance: Reduce dose to 300 mg once daily; may further reduce to 300 mg daily for 5 consecutive days per week

In clinical trials, **dose reductions** were instituted for the following adverse events: Increased serum creatinine, decreased appetite, hypokalemia, leukopenia, nausea, neutropenia, thrombocytopenia, and vomiting. Vorinostat was **discontinued** for the following adverse events: Anemia, angioneurotic edema, weakness, chest pain, exfoliative dermatitis, DVT, ischemic stroke, lethargy, pulmonary embolism, and spinal cord injury.

Administration: OralAdminister with food. Do not open, crush, or chew capsules.
Dietary ConsiderationsTake with food.
StorageStore at 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Gastrointestinal toxicities: Nausea, vomiting, and diarrhea may occur; antiemetics and antidiarrheals may be required. Replace fluids and electrolytes to avoid dehydration.
- Hematologic toxicity: Dose-related anemia and thrombocytopenia may occur; may require dosage adjustments.
- Hyperglycemia: May cause hyperglycemia. Use with caution in patients with diabetes mellitus; monitor; may require diet and/or therapy modifications.
- QT_c prolongation: With use, QT_c prolongation has been observed; a baseline and periodic 12-lead ECG should be obtained. Correct electrolyte abnormalities prior to treatment and monitor and correct potassium, calcium, and magnesium levels during therapy. Use caution in patients with a history of QT_c prolongation or with medications known to prolong the QT interval.
- Thromboembolic events: Pulmonary embolism and deep vein thrombosis (DVT) have been reported; monitor. Use caution in patients with a history of thrombotic events.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAnimal studies have demonstrated adverse fetal effects, including fetal loss, decreased fetal weight, and skeletal malformation. There are no adequate and well-controlled studies in pregnant women. Inform patient of potential hazard if used during pregnancy or if pregnancy occurs during treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (13%)

Central nervous system: Fatigue (46% to 73%), chills (12% to 16%), dizziness (15%), headache (12%), fever (11%)

Dermatologic: Alopecia (18% to 19%), pruritus (12%)

Endocrine & metabolic: Hyperglycemia (8% to 69%; grade 3: 5%), dehydration (16%)

Gastrointestinal: Diarrhea (49% to 52%), nausea (41% to 49%), taste perversion (24% to 46%), xerostomia (11% to 35%), weight loss (20% to 27%), anorexia (22% to 24%), vomiting (12% to 24%), appetite decreased (14% to 22%), constipation (11% to 15%)

Hematologic: Thrombocytopenia (22% to 54%; grades 3/4: 5% to 19%), anemia (2% to 14%; grades 3/4: 1% to 3%)

Neuromuscular & skeletal: Muscle spasm (16% to 20%)

Renal: Proteinuria (51%), creatinine increased (15% to 47%)

Respiratory: Dyspnea (34%), cough (11%), upper respiratory infection (11%)

1% to 10%:

Cardiovascular: QT_c prolongation (3% to 6%)

Dermatologic: Squamous cell carcinoma (4%)

Respiratory: Pulmonary embolism (5%)

<1%, postmarketing, and/or case reports: Angioneurotic edema, blurred vision, chest pain, cholecystitis, creatine phosphokinase (CPK) increased, DVT, enterococcal infection, exfoliative dermatitis, gastrointestinal hemorrhage, hemoptysis, hypertension, hypocalcemia, hypokalemia, hyponatremia, hypophosphatemia, infection, lethargy, leukopenia, MI, neutropenia, pneumonia, renal failure, sepsis, spinal cord injury, streptococcal bacteremia, stroke (ischemic), syncope, T-cell lymphoma, transaminases increased, tumor hemorrhage, ureteric obstruction, ureteropelvic junction obstruction, urinary retention, vasculitis, weakness

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Valproic Acid: May enhance the thrombocytopenic effect of Vorinostat. This may increase the risk of gastrointestinal bleeding. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Vorinostat may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersBaseline, then periodic 12-lead ECG; baseline, then every other week serum electrolytes (including calcium, magnesium and potassium), CBC with differential and platelets, serum creatinine and blood glucose for 2 months, then monthly

Nursing: Physical Assessment/MonitoringElectrolyte abnormalities should be corrected prior to treatment. Assess for potential adverse interactions with any other prescription, OTC, or herbal products patient may be taking (eg, anything that may prolong QT interval, increase risk of gastrointestinal bleeding, or increase risk of thrombocytopenia). Assess results of laboratory tests before beginning therapy and then regularly (eg, EKG, serum electrolytes, CBC, creatinine, and blood glucose). Evaluate therapeutic effectiveness and adverse reactions on a regular basis; dosing adjustment may be necessary. Caution patients with diabetes to monitor serum glucose closely. Teach patient correct use and proper handling of capsules, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBaseline, then periodic 12-lead ECG; baseline, then every other week serum electrolytes (including calcium, magnesium and potassium), CBC with differential and platelets, serum creatinine and blood glucose for 2 months, then monthly

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. Take exactly as directed, with food. Do not open, chew, or crush capsules. If capsule is accidentally opened or crushed, do not touch the capsules or powder. If powder gets on your skin, wash well with plain water and notify your prescriber. If you have diabetes, you should monitor your glucose levels closely and report immediately if your blood sugar is higher than normal. Maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake) and nutrition (small, frequent meals). You may experience dry mouth, taste changes, nausea, or vomiting (frequent oral care, sucking lozenges, or chewing gum may help); loss of hair (will grow back after treatment is discontinued); or dizziness or headache (use care when driving or engaging in tasks that require alertness until response to drug is known). Report any chest pain or palpitations; upper respiratory infection or difficulty breathing; muscle pain, tremors, weakness or spasms; swelling in foot, ankle, or leg; rash or itching; or any other persistent or acute adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. This drug may cause fetal deformities or loss of pregnancy; see prescriber for appropriate contraceptives. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Zolinza™: 100 mg

Generic AvailableNo

Manufacturer

Merck & Co, Inc

Mechanism of ActionInhibition of histone deacetylase enzymes, HDAC1, HDAC2, HDAC3, and HDAC6, which catalyze acetyl group removal from protein lysine residues (including histones and transcription factors). Inhibition of histone deacetylase results in accumulation of acetyl groups, leading to alterations in chromatin structure and transcription factor activation causing termination of cell growth leading to cell death.

Pharmacodynamics/Kinetics

Protein binding: ~71%

Metabolism: Glucuronidated and hydrolyzed (followed by beta-oxidation) to inactive metabolites

Bioavailability: Fasting: ~43%

Half-life elimination: ~2 hours

Time to peak, plasma: With high-fat meal: ~4 hours (range: 2-10 hours)

Excretion: Urine: 52% (<1% as unchanged drug, ~52% as inactive metabolites)

Dental Health Professional ConsiderationsThis drug is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Vorinostat is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: High incidence of xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentVorinostat causes dose-related thrombocytopenia; use caution with valproic acid. GI side effects are common; concomitant use with lithium, valproic acid, carbamazepine, and SSRIs may produce additive effects. Hyperglycemia is common; psychotropics may further alter glucose regulation. Xerostomia is common; concomitant use with psychotropics may produce additive effects.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Coumadin® may be confused with Avandia®, Cardura®, Compazine®, Kemadrin®

Jantoven™ may be confused with Janumet™, Januvia™

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

2009 National Patient Safety Goals: The Joint Commission on Accreditation of Healthcare Organizations requires healthcare organizations that provide anticoagulant therapy to have a process in place to reduce the risk of anticoagulant-associated patient harm. Patients receiving anticoagulants should receive individualized care through a defined process that includes standardized ordering, dispensing, administration, monitoring and education. This does not apply to routine short-term use of anticoagulants for prevention of venous thromboembolism when the expectation is that the patient's laboratory values will remain within or close to normal values (NPSG.03.05.01).

Pronunciation(WAR far in)

U.S. Brand NamesCoumadin®; Jantoven®

Canadian Brand NamesApo-Warfarin®; Coumadin®; Gen-Warfarin; Novo-Warfarin; Taro-Warfarin

Pharmacologic CategoryAnticoagulant, Coumarin Derivative; Vitamin K Antagonist

Use: Labeled IndicationsProphylaxis and treatment of thromboembolic disorders (eg, venous, pulmonary) and embolic complications arising from atrial fibrillation or cardiac valve replacement; adjunct to reduce risk of systemic embolism (eg, recurrent MI, stroke) after myocardial infarction

Use: Unlabeled/InvestigationalPrevention of recurrent transient ischemic attacks

Dosing: Adults**Note:** New labeling identifies genetic factors which may increase patient sensitivity to warfarin. Specifically, genetic variations in the proteins CYP2C9 and VKORC1, responsible for warfarin's primary metabolism and pharmacodynamic activity, respectively, have been identified as predisposing factors associated with decreased dose requirement and increased bleeding risk. A genotyping test is available, and may provide important guidance on initiation of anticoagulant therapy.

Prevention/treatment of thrombosis/embolism:

I.V. (administer as a slow bolus injection): 2-5 mg/day

Oral: Initial dosing must be individualized. Consider the patient (hepatic function, cardiac function, age, nutritional status, concurrent therapy, risk of bleeding) in addition to prior dose response (if available) and the clinical situation. Start 2-5 mg daily for 2 days **or** 5-10 mg daily for 1-2 days (Ansell, 2008). Adjust dose according to INR results; usual maintenance dose ranges from 2-10 mg daily (individual patients may require loading and maintenance doses outside these general guidelines).

Note: Lower starting doses may be required for patients with hepatic impairment, poor nutrition, CHF, elderly, high risk of bleeding, or patients who are debilitated, or those with reduced function genomic variants of the catabolic enzymes CYP2C9 (*2 or *3 alleles) or VKORC1 (-1639 polymorphism). Higher initial doses may be reasonable in selected patients (ie, receiving enzyme-inducing agents and with low risk of bleeding).

Dosing: ElderlyOral: Initial dose ≤5 mg. Usual maintenance dose: 2-5 mg/day. The elderly tend to require lower dosages to produce a therapeutic level of anticoagulation (due to changes in the pattern of warfarin metabolism).

Dosing: Pediatric**Prevention/treatment of thrombosis:** Oral: Infants and Children (unlabeled use): Initial loading dose (if baseline INR is 1-1.3): 0.2 mg/kg (maximum: 10 mg/dose); adjust dose based on INR (reported ranges to maintain INR of 2-3: 0.09-0.33 mg/kg/day). Infants <12 months of age may require doses at or near the high end of this range; consistent anticoagulation may be difficult to maintain in children <5 years of age.

Dosing: Renal ImpairmentNo adjustment required, however, patients with renal failure have an increased risk of bleeding complications. Monitor closely.

Dosing: Hepatic ImpairmentMonitor effect at usual doses. The response to oral anticoagulants may be markedly enhanced in obstructive jaundice, hepatitis, and cirrhosis. INR should be closely monitored.

Administration: I.V.Administer as a slow bolus injection over 1-2 minutes. Avoid all I.M. injections.

Administration: I.V. DetailpH: 8.1-8.3

Administration: OralAdminister with or without food. Take at the same time each day.

Dietary ConsiderationsFoods high in vitamin K (eg, beef liver, pork liver, green tea, and leafy green vegetables) inhibit anticoagulant effect. Do not change dietary habits once stabilized on warfarin therapy. A balanced diet with a consistent intake of vitamin K is essential. Avoid large amounts of alfalfa, asparagus, broccoli, Brussels sprouts, cabbage, cauliflower, green teas, kale, lettuce, spinach, turnip greens, and watercress; decreased efficacy of warfarin. It is recommended that the diet contain a CONSISTENT vitamin K content of 70-140 mcg/day. Check with healthcare provider before changing diet.

Storage

Injection: Prior to reconstitution, store at 15°C to 30°C (59°F to 86°F). Following reconstitution with 2.7 mL of sterile water (yields 2 mg/mL solution), stable for 4 hours at 15°C to 30°C (59°F to 86°F). Protect from light.

Tablet: Store at 15°C to 30°C (59°F to 86°F). Protect from light.

ReconstitutionReconstitute with 2.7 mL of sterile water (yields 2 mg/mL solution).

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, **variable stability (consult detailed reference)** in LR, NS.

Y-site administration: Compatible: Amikacin, ascorbic acid injection, cefazolin, ceftriaxone, dopamine, epinephrine, heparin, lidocaine, metaraminol, morphine, nitroglycerin, oxytocin, potassium chloride, ranitidine. **Incompatible:** Aminophylline, bretylium, ceftazidime, cimetidine, ciprofloxacin, dobutamine, esmolol, gentamicin, labetalol, metronidazole, promazine, Ringer's injection. **Variable (consult detailed reference):** Ammonium chloride, vancomycin.

Compatibility in syringe: Incompatible: Heparin.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to warfarin or any component of the formulation; hemorrhagic tendencies (eg, patients bleeding from the GI, respiratory, or GU tract; aneurysm; cerebrovascular hemorrhage; following spinal puncture and other diagnostic or therapeutic procedures with potential for significant bleeding; history of bleeding diathesis); recent or potential surgery of the eye or CNS; major regional lumbar block anesthesia or surgery resulting in large, open surfaces; blood dyscrasias; severe uncontrolled or malignant hypertension; pericarditis or pericardial effusion; subacute bacterial endocarditis; history of warfarin-induced necrosis; an unreliable, noncompliant patient; alcoholism; patient who has a history of falls or is a significant fall risk; unsupervised senile or psychotic patient; eclampsia/pre-eclampsia, threatened abortion, pregnancy

Allergy Considerations

- Coumarin-Type Anticoagulant Allergy

Warnings/Precautions

Boxed warnings:

- Bleeding: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity: May cause hypersensitivity reactions, including anaphylaxis; use with caution in patients with anaphylactic disorders.

- Bleeding: **[U.S. Boxed Warning]: May cause major or fatal bleeding.** Risk factors for bleeding include high intensity anticoagulation (INR >4), age (≥65 years), variable INRs, history of GI bleeding, hypertension, cerebrovascular disease, serious heart disease, anemia, severe diabetes, malignancy, trauma, renal insufficiency, polycythemia vera, vasculitis, open wound, history of PUD, indwelling catheters, menstruating and postpartum women, drug-drug interactions, long duration of therapy, or known genetic deficiency in CYP2C9 activity. Patient must be instructed to report bleeding, accidents, or falls as well as any new or discontinued medications, herbal or alternative products used, or significant changes in smoking or dietary habits. Unrecognized bleeding sites (eg, colon cancer) may be uncovered by anticoagulation.

- Skin necrosis/gangrene: Necrosis or gangrene of the skin and other tissue can occur (rarely, <0.1%) due to paradoxical local thrombosis; onset is usually within the first few days of therapy and is frequently localized to the limbs, breast, or penis. The risk of this effect is increased in patients with protein C or S deficiency.

- “Purple toe” syndrome, due to cholesterol microembolization, has been rarely described with coumarin-type anticoagulants. Typically, this occurs after several weeks of therapy, and may present as a dark, purplish, mottled discoloration of the plantar and lateral surfaces. Other manifestations of cholesterol microembolization may include rash; livedo reticularis; gangrene; abrupt and intense pain in lower extremities; abdominal, flank, or back pain; hematuria, renal insufficiency; hypertension; cerebral ischemia; spinal cord infarction; or other symptoms of vascular compromise.

Disease-related concerns:

- Dietary insufficiency: Use with caution in patients with prolonged dietary insufficiencies (vitamin K deficiency).

- Heparin-induced thrombocytopenia: Use with caution in patients with heparin-induced thrombocytopenia and DVT; limb ischemia, necrosis, and gangrene have occurred when warfarin was started or continued after heparin was stopped. Warfarin monotherapy is contraindicated in the initial treatment of active HIT; warfarin initially inhibits the synthesis of protein C, potentially accelerating the underlying active thrombotic process.

- Hepatic impairment: Reduced liver function, regardless of etiology, may impair synthesis of coagulation factors leading to increased warfarin sensitivity.

- Infection: Use with caution in patients with acute infection or active TB or any disruption of normal GI flora; antibiotics and fever may alter response to warfarin.

- Renal impairment: Use with caution in patients with moderate-to-severe renal impairment.

- Thyroid disease: Use with caution in patients with thyroid disease.

Special populations:

- Elderly: The elderly may be more sensitive to anticoagulant therapy.

- Ovulating women: May be at risk of developing ovarian hemorrhage at the time of ovulation.

- Patients with genomic variants in CYP2C9 and/or VKORC1: Presence of the CYP2C9*2 or *3 allele and/or polymorphism of the vitamin K oxidoreductase (VKORC1) gene may increase the risk of bleeding. The *2 allele is reported to occur with a frequency of 4% to 11% in African-Americans and Caucasians, respectively, while the *3 allele frequencies are 2% to 7% respectively. Other variant 2C9 alleles (eg, *5, *6, *9, and *11) are also associated with reduced metabolic activity and thus may increase risk of bleeding, but are much less common. Lower doses may be required in these patients; genetic testing may help determine appropriate dosing.

- Pediatrics: Safety and efficacy have not been established in children; monitor closely.

Other warnings/precautions:

- Patient selection: Use care in the selection of patients appropriate for this treatment; ensure patient cooperation especially from the alcoholic, illicit drug user, demented, or psychotic patient; ability to comply with routine laboratory monitoring is essential.

Geriatric ConsiderationsBefore committing an elderly patient to long-term anticoagulation therapy, the risk for bleeding complications secondary to falls, drug interactions, living situation, and cognitive status should be considered. A risk of bleeding complications has been associated with increased age.

Pregnancy Risk FactorX

Pregnancy ConsiderationsOral anticoagulants cross the placenta and produce fetal abnormalities. May also cause fatal fetal hemorrhage. Warfarin should not be used during pregnancy because of significant risks. Adjusted-dose heparin can be given safely throughout pregnancy in patients with venous thromboembolism.

LactationDoes not enter breast milk, only metabolites are excreted (AAP rates “compatible”)

Breast-Feeding ConsiderationsWarfarin does not pass into breast milk and can be given to nursing mothers (AAP rates “compatible”). However, limited data suggests prolonged PT may occur in some infants. Women who are breast-feeding should be carefully monitored to avoid excessive anticoagulation. Evaluation of coagulation tests and vitamin K status of breast-feeding infant is considered prudent.

Adverse ReactionsBleeding is the major adverse effect of warfarin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility.

Cardiovascular: Angina, chest pain, edema, hemorrhagic shock, hypotension, pallor, syncope, vasculitis

Central nervous system: Coma, dizziness, fatigue, fever, headache, lethargy, malaise, pain, stroke

Dermatologic: Alopecia, bullous eruptions, dermatitis, rash, pruritus, urticaria

Gastrointestinal: Abdominal cramps, abdominal pain, anorexia, diarrhea, flatulence, gastrointestinal bleeding, mouth ulcers, nausea, taste disturbance, vomiting

Genitourinary: Hematuria, priapism

Hematologic: Agranulocytosis, anemia, leukopenia, retroperitoneal hematoma, unrecognized bleeding sites (eg, colon cancer) may be uncovered by anticoagulation

Hepatic: Cholestatic jaundice, hepatic injury, hepatitis, transaminases increased

Neuromuscular & skeletal: Joint pain, muscle pain, osteoporosis (potential association with long-term use), paralysis, paresthesia, weakness

Respiratory: Dyspnea, tracheobronchial calcification

Miscellaneous: Anaphylactic reaction, cold intolerance, hypersensitivity/allergic reactions, skin necrosis, gangrene, “purple toes” syndrome

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C9 (major), 2C19 (minor), 3A4 (minor); **Inhibits** CYP2C9 (moderate), 2C19 (weak)

Drug Interactions

Acetaminophen: May enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Allopurinol: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Aminoglutethimide: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Amiodarone: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Androgens: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antineoplastic Agents: May enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. **Exceptions:** Alitretinoin; Altretamine; Aminoglutethimide; Anastrozole; Asparaginase; AzaCITIDine; Bleomycin; Capecitabine; CARBOplatin; Carmustine; Chlorambucil; CISplatin; Cladribine; Cytarabine; Cytarabine (Liposomal); Dacarbazine; DACTINomycin; DAUNOrubicin Citrate (Liposomal); DAUNOrubicin Hydrochloride; Denileukin Diftitox; Docetaxel; DOXOrubicin (Liposomal); Epirubicin; Estramustine; Etoposide Phosphate; Exemestane; Fludarabine; Goserelin; Hydroxyurea; IDArubicin; Irinotecan; Letrozole; Leuprolide; Lomustine; Mechlorethamine; Megestrol; Mitomycin; Mitoxantrone; Nilutamide; Paclitaxel; Pegaspargase; Pentostatin; Polyestradiol; Porfimer; RiTUXimab; Streptozocin; Tamoxifen; Temozolomide; Teniposide; Thioguanine; Thiotepa; Topotecan; Toremifene; Tretinoin (Oral); Valrubicin; VinBLAStine; Vinorelbine. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antithyroid Agents: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Atazanavir: May increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

AzaTHIOprine: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Vitamin K Antagonists. *Risk C: Monitor therapy*

Bosentan: May increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Capecitabine: May increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Cephalosporins: May enhance the anticoagulant effect of Vitamin K Antagonists. **Exceptions:** Cefaclor; Cefadroxil; Cefdinir; Cefepime; Cefixime; Cefonicid; Cefotaxime; Cefpodoxime; Cefprozil; Ceftazidime; Ceftibuten; Ceftizoxime; Ceftobiprole; Cefuroxime; Cephalexin; Cephradine [Off Market]. *Risk C: Monitor therapy*

Cimetidine: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Clopidogrel: May enhance the anticoagulant effect of Warfarin. *Risk D: Consider therapy modification*

Coenzyme Q-10: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Contraceptive (Progestins): May diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): May enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Cranberry: May enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dicloxacillin: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Disulfiram: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Drotrecogin Alfa: Vitamin K Antagonists may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Efavirenz: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Etoposide: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Fenofibrate: May enhance the anticoagulant effect of Warfarin. Fenofibrate may increase the serum concentration of Warfarin. *Risk D: Consider therapy modification*

Fenofibric Acid: May enhance the anticoagulant effect of Warfarin. Fenofibric Acid may increase the serum concentration of Warfarin. *Risk D: Consider therapy modification*

Fenugreek: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fluconazole: May increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fluorouracil: May increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Warfarin. The active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Gefitinib: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ginseng (American): May decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Glucagon: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Glutethimide: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Griseofulvin: May increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: May enhance the anticoagulant effect of Vitamin K Antagonists. **Exceptions:** Atorvastatin. *Risk C: Monitor therapy*

Ifosfamide: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Imatinib: May enhance the anticoagulant effect of Warfarin. Imatinib may decrease the metabolism of Warfarin. *Risk D: Consider therapy modification*

Itraconazole: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ivermectin: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ketoconazole: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Leflunomide: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Lopinavir: May decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Vitamin K Antagonists. **Exceptions:** Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Mercaptopurine: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

MetroNIDAZOLE: May decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Miconazole: May increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Nafcillin: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Oral Contraceptive (Estrogens): May diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Orlistat: May enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Phenytoin: May enhance the anticoagulant effect of Vitamin K Antagonists. Vitamin K Antagonists may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Phytonadione: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Posaconazole: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Propafenone: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Proton Pump Inhibitors: May increase the serum concentration of Warfarin. **Exceptions:** Esomeprazole; Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

QuiNIDine: May enhance the anticoagulant effect of Vitamin K Antagonists. Note that the prothrombin time might be unchanged in the face of increased bleeding. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ritonavir: May decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Sitaxsentan: May increase the serum concentration of Warfarin. *Risk D: Consider therapy modification*

Sorafenib: May enhance the anticoagulant effect of Warfarin. Sorafenib may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Sulfinpyrazone [Off Market]: May decrease the metabolism of Vitamin K Antagonists. Sulfinpyrazone [Off Market] may decrease the protein binding of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Tamoxifen: May increase the serum concentration of Vitamin K Antagonists. *Risk X: Avoid combination*

Tetracycline Derivatives: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thyroid Products: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Tigecycline: May increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Tolterodine: May enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin A: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin E: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vorinostat: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zafirlukast: May decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zileuton: May increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol. Acute ethanol ingestion (binge drinking) decreases the metabolism of warfarin and increases PT/INR. Chronic daily ethanol use increases the metabolism of warfarin and decreases PT/INR.

Food: The anticoagulant effects of warfarin may be decreased if taken with foods rich in vitamin K. Vitamin E may increase warfarin effect. Cranberry juice may increase warfarin effect.

Herb/Nutraceutical: Cranberry, fenugreek, ginkgo biloba, glucosamine, may enhance bleeding or increase warfarin's effect. Ginseng (American), coenzyme Q_{10}, and St John’s wort may decrease warfarin levels and effects. Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American), ginseng (Panax), ginseng (Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, omega-3-acids, prickly ash, red clover, reishi, SAMe (s-adenosylmethionine), sweet clover, turmeric, and white willow (all have additional antiplatelet activity).

Monitoring ParametersProthrombin time, hematocrit, INR; consider genotyping of CYP2C9 and VKORC1 prior to initiation of therapy, if available

Reference Range

INR = patient prothrombin time/mean normal prothrombin time

ISI = international sensitivity index

INR should be increased by 2-3.5 times depending upon indication. An INR >4 does not generally add additional therapeutic benefit and is associated with increased risk of bleeding.

Adult INR ranges based upon indication: See table.

Adult Target INR Ranges Based Upon Indication

Indication	**Targeted INR**	**Targeted INR Range**
Cardiac		
Acute myocardial infarction (high risk)[1]	2.5	2-3[2,3]
Atrial fibrillation or atrial flutter	2.5	2-3
Valvular		
Bileaflet or Medtronic Hall tilting disk mechanical aortic valve in normal sinus rhythm and normal LA size	2.5	2-3
Bileaflet or tilting disk mechanical mitral valve	3	2.5-3.5

Caged ball or caged disk mechanical valve	3	2.5-3.5
Mechanical prosthetic valve with systemic embolism despite adequate anticoagulation	3 **or** 3.5[4]	2.5-3.5[4] **or** 3-4[4]
Mechanical valve and risk factors for thromboembolism (eg, AF, MI[5], LA enlargement, hypercoagulable state, low EF) or history of atherosclerotic vascular disease	3	2.5-3.5[6]
Bioprosthetic mitral valve	2.5	2-3[7]
Bioprosthetic mitral or aortic valve with prior history of systemic embolism	2.5	2-3[7]
Bioprosthetic mitral or aortic valve with evidence of LA thrombus at surgery	2.5	2-3[8]
Bioprosthetic mitral or aortic valve with risk factors for thromboembolism (eg, AF, hypercoagulable state or low EF)	2.5	2-3[9]
Prosthetic mitral valve thrombosis (resolved)	4	3.5-4.5[3]
Prosthetic aortic valve thrombosis (resolved)	3.5	3-4[3]
Rheumatic mitral valve disease and normal sinus rhythm (LA diameter >5.5 cm), AF, previous systemic embolism, or LA thrombus	2.5	2-3
Thromboembolism Treatment		
Venous thromboembolism	2.5	2-3[10,11]
Thromboprophylaxis		
Chronic thromboembolic pulmonary hypertension (CTPH)	2.5	2-3
Lupus inhibitor (no other risk factors)	2.5	2-3
Lupus inhibitor and recurrent thromboembolism	3	2.5-3.5
Major trauma patients with impaired mobility undergoing rehabilitation	2.5	2-3
Spinal cord injury (acute) undergoing rehabilitation	2.5	2-3
Total hip or knee replacement (elective) or hip fracture surgery	2.5	2-3[12]
Other Indications		
Cerebral venous sinus thrombosis	2.5	2-3[13]
Ischemic stroke due to AF	2.5	2-3

[1] High-risk includes large anterior MI, significant heart failure, intracardiac thrombus, atrial fibrillation, history of thromboembolism.

[2]Maintain anticoagulation for 3 months.
[3]Combine with aspirin 81 mg/day.
[4]Combine with aspirin 81 mg/day, if not previously receiving, **and/or** if previous target INR was 2.5, then new target INR should be 3 (2.5-3.5). If previous target INR was 3, then new target INR should be 3.5 (3-4).
[5]MI refers to anterior-apical ST-segment elevation myocardial infarction.
[6]Combine with aspirin 81 mg/day unless patient is at high risk of bleeding (eg, history of GI bleed, age >80 years).
[7]Maintain anticoagulation for 3 months after valve insertion then switch to aspirin 81 mg/day if no other indications for warfarin exist or clinically reassess need for warfarin in patients with prior history of systemic embolism.
[8]Maintain anticoagulation with warfarin until thrombus resolution.
[9]If patient has history of atherosclerotic vascular disease, combine with aspirin 81 mg/day unless patient is at high risk of bleeding (eg, history of GI bleed, age >80 years).
[10]Treat for 3 months in patients with VTE due to transient reversible risk factor. Treat for a minimum of 3 months in patients with unprovoked VTE and evaluate for long term therapy. Other risk groups (eg, cancer) may require >3 months of therapy.
[11]In patients with unprovoked VTE who prefer less frequent INR monitoring, low-intensity therapy (INR range: 1.5-1.9) with less frequent monitoring is recommended over stopping treatment.
[12]Continue for at least 10 days and up to 35 days after surgery.
[13]Continue for up to 12 months.

Warfarin levels are not used for monitoring degree of anticoagulation. They may be useful if a patient with unexplained coagulopathy is using the drug surreptitiously or if it is unclear whether clinical resistance is due to true drug resistance or lack of drug intake.

Normal prothrombin time (PT): 10.9-12.9 seconds. Healthy premature newborns have prolonged coagulation test screening results (eg, PT, aPTT, TT) which return to normal adult values at approximately 6 months of age. Healthy prematures, however, do not develop spontaneous hemorrhage or thrombotic complications because of a balance between procoagulants and inhibitors.

Nursing: Physical Assessment/MonitoringUse caution with any condition that increases risk of bleeding (eg, dietary vitamin K or C deficiency, hypertension, open wounds, TB, PUD, diabetes, thyroid or renal disease, recent surgery). Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (especially those medications that may affect coagulation or platelet aggregation). Assess results of laboratory tests closely. Patient should be monitored frequently for therapeutic effectiveness and adverse reactions (eg, bleeding from any site, rash, urticaria, gastrointestinal upset, abdominal pain, diarrhea, hypersensitivity reaction). Teach patient possible side effects/appropriate interventions (eg, safety precautions) and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Teach patients of childbearing age appropriate use of contraceptives.
Monitoring: Lab TestsProthrombin time (desirable range usually 1.5-2 times the control), hematocrit, INR (desirable range usually 2-3 with standard therapy, 2.5-3.5 with high-dose therapy); consider genotyping of CYP2C9 and VKORC1 prior to initiation of therapy, if available
Patient EducationIt is imperative that you inform prescriber of all prescriptions, OTC medications, or herbal products you are taking. Do not take any new medication during therapy unless approved by prescriber. Take exactly as directed; if dose is missed, take as soon as possible. Do not double dose. Follow diet and activity as recommended by prescriber; check with prescriber before changing diet. Avoid alcohol. Do not make major changes in your dietary intake of vitamin K (green vegetables). You will have a tendency to bleed easily while taking this drug (use soft toothbrush, waxed dental floss, electric razor, and avoid scissors or sharp knives and potentially harmful activities). May cause nausea, vomiting, disturbed taste (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report any unusual bleeding or bruising (eg, bleeding gums, nosebleed, blood in urine, dark stool, bloody emesis, heavier than usual menses, or menstrual irregularities); skin rash or irritation; unusual fever; persistent nausea or GI upset; pain in joints or back; swelling or pain at injection site; or unhealed wounds. **Pregnancy precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium:

Coumadin®: 5 mg

Tablet, as sodium: 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg

Coumadin®: 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg [scored]

Coumadin®: 10 mg [scored; dye free]

Jantoven®: 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg [scored]

Jantoven®: 10 mg [scored; dye free]

Mechanism of ActionHepatic synthesis of coagulation factors II, VII, IX, and X, as well as proteins C and S, requires the presence of vitamin K. These clotting factors are biologically activated by the addition of carboxyl groups to key glutamic acid residues within the proteins' structure. In the process, "active" vitamin K is oxidatively converted to an "inactive" form, which is then subsequently re-activated by vitamin K epoxide reductase complex 1 (VKORC1). Warfarin competitively inhibits the subunit 1 of the multi-unit VKOR complex, thus depleting functional vitamin K reserves and hence reduces synthesis of active clotting factors.

Pharmacodynamics/Kinetics

Onset of action: Anticoagulation: Oral: 24-72 hours

Peak effect: Full therapeutic effect: 5-7 days; INR may increase in 36-72 hours

Duration: 2-5 days

Absorption: Oral: Rapid, complete

Distribution: 0.14 L/kg

Protein binding: 99%

Metabolism: Hepatic, primarily via CYP2C9; minor pathways include CYP2C8, 2C18, 2C19, 1A2, and 3A4

Genomic variants: Approximately 37% reduced clearance of S-warfarin in patients heterozygous for 2C9 (*1/*2 or *1/*3), and ~70% reduced in patients homozygous for reduced function alleles (*2/*2, *2/*3, or *3/*3)

Half-life elimination: 20-60 hours; Mean: 40 hours; highly variable among individuals

Time to peak, plasma: Oral: ~4 hours

Excretion: Urine (92%, primarily as metabolites)

Related Information

- Treatment of Elevated INR Due to Warfarin

Pharmacotherapy PearlsProspective genotyping is available, and may provide important guidance on initiation of anticoagulant therapy. Commercial testing with PGxPredict™:WARFARIN is now available from PGxHealth™ (Division of Clinical Data, Inc, New Haven, CT). The test genotypes patients for presence of the CYP2C9*2 or *3 alleles and the VKORC1 -1639G>A polymorphism. The results of the test allow patients to be phenotyped as extensive, intermediate, or poor metabolizers (CYP2C9) and as low, intermediate, or high warfarin sensitivity (VKORC1). Ordering information is available at 888-592-7327 or warfarininfo@pgxhealth.com.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulcers and taste disturbance.

Signs of warfarin overdose may first appear as bleeding from gingival tissue.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; barbiturates and carbamazepine may decrease the anticoagulant effect of warfarin; chloral hydrate, alcohol, disulfiram, and SSRIs may enhance the anticoagulant effect

Cardiovascular Considerations

Factor VII half-life: 4-6 hours

Factor X half-life: 27-48 hours

Factor II half-life: 42-72 hours

Overlapping heparin and warfarin therapy by at least 5 days is necessary in treatment of DVT/PE even if the INR is therapeutic earlier. Although an elevation in INR (factor VII depletion) may be seen early (first 24-48 hours) in warfarin therapy, it does not represent adequate anticoagulation. Factors II and X must be depleted which takes considerably longer.

Vitamin K Rich Foods: Significant changes in vitamin K intake can upset warfarin stability. The list of usual foods with high vitamin K content are well known, however, unique ones continue to appear like green tea, chewing tobacco, a variety of oils (canola, corn, olive, peanut, safflower, sesame seed, soybean, and sunflower). Snack foods containing Olestra have 80 mcg of vitamin K added to each ounce. Some natural products may contain hidden sources of vitamin K.

Heparin-Induced Thrombocytopenia (HIT) or Heparin-Induced Thrombotic Thrombocytopenia Syndrome (HITTS): When a patient develops HIT/HITTS, warfarin monotherapy is contraindicated. Rather, a direct thrombin inhibitor should be initiated and continued until platelets return. When appropriate, initiating warfarin at low doses and overlapping with a direct thrombin inhibitor for at least 5 days and until the INR is therapeutic for at least 48 hours is suggested.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Tube-feeding formulas are often a rich source of vitamin K.

Management of Oral Anticoagulation Prior to Surgery:

Patients with low risk of thromboembolism: Stop warfarin therapy approximately 4 days before surgery, allow the INR to return to a near normal level, briefly administer postoperative prophylaxis (if the intervention itself creates a higher risk of thrombosis) using low-dose heparin or LMWH, and simultaneously begin warfarin therapy after surgery.

Patients with intermediate risk of thromboembolism: Stop warfarin therapy approximately 4 days before surgery, allow the INR to fall. Initiate low-dose heparin or prophylactic dose of LMWH beginning 2 days before surgery. Then commence full-dose heparin or LMWH, and warfarin therapy after surgery.

Patients with high risk of thromboembolism (eg, a recent [<3 months] history of venous thromboembolism, a mechanical cardiac valve in the mitral position, or an old model of cardiac valve [ball/cage]): Stop warfarin therapy approximately 4 days before surgery, allow the INR to return to a normal level, begin therapy with full-dose heparin or full-dose LMWH as the INR falls (approximately 2 days before surgery). Heparin can be administered as a SubQ injection on an outpatient basis, can then be given as a continuous I.V. infusion after hospital admission in preparation for surgery, and can be discontinued 5 hours before surgery with the expectation that the anticoagulant effect will have worn off at the time of surgery. It is also possible to continue the administration of SubQ heparin or LMWH and to stop therapy 12-24 hours before surgery with the expectation that the anticoagulant effect will be very low or will have worn off by the time of surgery.

Patients with low risk of bleeding: Continue warfarin therapy at a lower dose and operate at an INR of 1.3-1.5, an intensity that has been shown to be safe in randomized trials of gynecologic and orthopedic surgical patients. The dose of warfarin can be lowered 4-5 days before surgery. Warfarin therapy then can be restarted after surgery and supplemented with low-dose heparin or LMWH if necessary.

Heparin-Induced Thrombocytopenia (HIT) or Heparin-Induced Thrombotic Thrombocytopenia Syndrome (HITTS): When a patient develops HIT/HITTS, warfarin monotherapy is contraindicated. Rather, a direct thrombin inhibitor should be initiated. Warfarin anticoagulation should be postponed in the patient with HIT until substantial recovery of the platelet count has occurred. When appropriate, initiating warfarin at low doses and overlapping with a direct thrombin inhibitor for at least 5 days and until the INR is therapeutic for at least 48 hours is suggested.

Evidence-Based Information:

Management of Intracerebral Hemorrhage (ICH) Due to Warfarin: Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, warfarin-related ICH should be treated with I.V. vitamin K at a dose of 10 mg given slowly (not to exceed 1 mg/min) (Class I recommendation). It is important to also administer fresh frozen plasma (FFP) since vitamin K may take several hours to normalize INR. Other options besides FFP include prothrombin complex concentrate (PCC) which contains high levels of vitamin K-dependent factors (II, VII, and X) and factor IX complex which contains factors II, VII, IX, and X (Class IIb recommendation). Use of rFVIIa has shown promise for this indication. Advantages to rFVIIa include faster onset of action compared to FFP and vitamin K and a 50% lower volume is required compared to FFP. Disadvantages include a short half-life (~ 2.6 hours) requiring multiple doses to maintain a normalized INR and an increased risk of thromboembolic complications. Dosing of rFVIIa ranges between 15-90 mcg/kg. The use of factor-containing products has a risk of thromboembolism.

Pronunciation(witch HAY zel)
U.S. Brand NamesDickinson's® Witch Hazel [OTC]; Preparation H® Medicated Wipes [OTC]; T.N. Dickinson's® Hazelets [OTC]; Tucks® [OTC]
Canadian Brand NamesPreparation H® Cleansing Pads
Pharmacologic CategoryAstringent
Use: Labeled IndicationsAfter-stool wipe to remove most causes of local irritation; temporary management of vulvitis, pruritus ani and vulva; help relieve the discomfort of simple hemorrhoids, anorectal surgical wounds, and episiotomies
Dosing: Adults**Hemorrhoids:** Topical: Apply to anorectal area as needed
Dosing: ElderlyRefer to adult dosing.
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, topical: 100% (120 mL, 480 mL)

Dickinson's® Witch Hazel: 100% (60 mL, 240 mL, 480 mL)

Pads: 50% (100s)

Dickinson's® Witch Hazel: 50% (20s) [towelettes]; (50s) [contains aloe]; (100s) [hemorrhoidal]

Preparation H® Medicated Wipes: 50% (8s, 48s) [contains aloe]

T.N. Dickinson's® Hazelets: 50% (50s) [contains aloe]; (60s)

Tucks®: 50% (12s, 40s, 100s)

↑ Pharmacologic Category[Chemotherapy Regimen, Colorectal Cancer]
↑ Regimen UseColorectal cancer
↑ Index TermsCapecitabine-Oxaliplatin (Colorectal Cancer); Oxaliplatin-Capecitabine (Colorectal Cancer)
↑ RegimenNote: Multiple variations are listed below.

Variation 1:

Oxaliplatin: I.V.: 130 mg/m^2 day 1

[total dose/cycle = 130 mg/m^2]

Capecitabine: Oral: 2500 mg/m^2/day days 1 to 14

[total dose/cycle = 35,000 mg/m^2]

Repeat cycle every 21 days

Variation 2:

Oxaliplatin: I.V.: 85 mg/m^2 day 1

[total dose/cycle = 85 mg/m^2]

Capecitabine: Oral: 3500 mg/m^2/day days 1 to 7

[total dose/cycle = 24,500 mg/m^2]

Repeat cycle every 14 days

Variation 3:

Oxaliplatin: I.V.: 50-80 mg/m^2/day days 1, 8, 22, and 29

[total dose/cycle = 200-320 mg/m^2]

Capecitabine: Oral: 1650 mg/m^2/day days 1 to 14 and 22 to 35

[total dose/cycle = 46,200 mg/m^2]

Variation 4:

Oxaliplatin: I.V.: 70 mg/m^2/day days 1 and 8

[total dose/cycle = 140 mg/m^2]

Capecitabine: Oral: 2000 mg/m^2/day days 1 to 14

[total dose/cycle = 28,000 mg/m^2]

Repeat cycle every 21 days

Variation 5:

Oxaliplatin: I.V.: 120 mg/m^2 day 1

[total dose/cycle = 120 mg/m^2]

Capecitabine: Oral: 2500 mg/m^2/day days 1 to 14

[total dose/cycle = 35,000 mg/m^2]

Repeat cycle every 21 days

Variation 6:

Oxaliplatin: I.V.: 85 mg/m^2 day 1

[total dose/cycle = 85 mg/m^2]

Capecitabine: Oral: 2500 mg/m^2/day days 1 to 7

[total dose/cycle = 17,500 mg/m^2]

or Capecitabine: Oral: 3000 mg/m^2/day days 1 to 7

[total dose/cycle = 21,000 mg/m^2]

or Capecitabine: Oral: 3500 mg/m^2/day days 1 to 7

[total dose/cycle = 24,500 mg/m^2]

or Capecitabine: Oral: 4000 mg/m^2/day days 1 to 7

[total dose/cycle = 28,000 mg/m^2]

Repeat cycle every 14 days

Variation 7:

Oxaliplatin: I.V.: 130 mg/m^2 day 1

[total dose/cycle = 130 mg/m^2]

Capecitabine: Oral: 1000 mg/m^2 twice daily days 1 (beginning with evening dose) to 15 (ending with morning dose)

[total dose/cycle = 28,000 mg/m^2]

Repeat cycle every 21 days

Medication Safety Issues

Sound-alike/look-alike issues:

Otrivin® may be confused with Lotrimin®

Pronunciation(zye loe met AZ oh leen)
U.S. Brand NamesOtrivin® Pediatric [OTC] [DSC]; Otrivin® [OTC] [DSC]
Canadian Brand NamesBalminil
Pharmacologic CategoryImidazoline Derivative; Vasoconstrictor, Nasal
Use: Labeled IndicationsSymptomatic relief of nasal and nasopharyngeal mucosal congestion
Dosing: Adults**Nasal congestion:** Nasal: Instill 2-3 drops or sprays (0.1%) in each nostril every 8-10 hours
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Nasal congestion:** Nasal:

Children 2-12 years: Instill 2-3 drops (0.05%) in each nostril every 8-10 hours.

Children >12 years: Refer to adult dosing.

Geriatric ConsiderationsEvaluate the patient's ability to self-administer; use with caution in patients with cardiovascular disease.
Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation

Central nervous system: Dizziness, drowsiness, headache, seizure

Ocular: Blurred vision, ocular irritation, photophobia

Miscellaneous: Diaphoresis

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, intranasal drops, as hydrochloride:

Otrivin® [DSC]: 0.1% (25 mL)

Otrivin® Pediatric [DSC]: 0.05% (25 mL)

Solution, intranasal spray, as hydrochloride (Otrivin® [DSC]): 0.1% (20 mL)

Generic AvailableNo
Mechanism of ActionStimulates alpha-adrenergic receptors in the arterioles of the conjunctiva and the nasal mucosa to produce vasoconstriction
Pharmacodynamics/Kinetics

Onset of action: Intranasal: Local vasoconstriction: 5-10 minutes

Duration: 5-6 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported

Yellow Fever Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(YEL oh FEE ver vak SEEN)

U.S. Brand NamesYF-VAX®

Canadian Brand NamesYF-VAX®

Pharmacologic CategoryVaccine, Live (Viral)

Use: Labeled IndicationsInduction of active immunity against yellow fever virus, primarily among persons traveling or living in areas where yellow fever infection exists and laboratory workers who may be exposed to the virus; vaccination may also be required for some international travelers

Dosing: Adults**Immunization:** SubQ: One dose (0.5 mL) ≥10 days before travel; Booster: Every 10 years for those at continued risk of exposure

Dosing: ElderlyRefer to adult dosing. Monitor closely.

Dosing: Pediatric**Immunization:** SubQ:

Children ≥6 months (unlabeled use [CDC guidelines]): One dose (0.5 mL) ≥10 days before travel; Booster: Every 10 years for those at continued risk of exposure

Children ≥9 months (per manufacturer): One dose (0.5 mL) ≥10 days before travel; Booster: Every 10 years for those at continued risk of exposure

Administration: OtherFor SubQ injection only. Do not administer I.M. or I.V.

StorageStore at 2°C to 8°C (35°F to 46°F); do not freeze.

ReconstitutionReconstitute only with diluent provided. Inject diluent slowly into vial and allow to stand for 1-2 minutes. Gently swirl until a uniform suspension forms; swirl well before withdrawing dose. Avoid vigorous shaking to prevent foaming of suspension. Vaccine must be used within 60 minutes of reconstitution. Keep suspension refrigerated until used.

ContraindicationsHypersensitivity to egg or chick embryo protein, or any component of the formulation; children <9 months of age (per manufacturer); children <6 months of age (CDC guidelines); acute or febrile disease; immunosuppressed patients; breast-feeding women

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. Use is contraindicated in patients with immediate-type hypersensitivity reactions to eggs. Less severe or localized manifestations of allergy are not contraindications; in general, persons who are able to eat eggs or egg products may receive the vaccine.

Special populations:

- Acute illness: Immunization should be delayed during the course of an acute or febrile illness. The presence of a low-grade fever is generally not a reason to postpone vaccination.

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids and patients <24 months after hematopoietic stem cell transplant]); may have a reduced response to vaccination. Patients who are immunosuppressed have a theoretical risk of encephalitis with yellow fever vaccine administration; consider delaying travel or obtaining a waiver letter. Patients on low-dose or short-term corticosteroids, or with asymptomatic HIV infection are not considered immunosuppressed and may be offered the vaccine. If vaccination is only to satisfy an international requirement (as opposed to decreasing risk of infection), efforts should be made to obtain a waiver letter.

- Elderly: Use with caution in the elderly; the risk of adverse events is increased in patients ≥65 years of age

- Pediatrics: The manufacturer contraindicates use in infants <9 months of age due to risk of encephalitis. The CDC allows for use in infants 6-8 months of age when possible exposure with the yellow fever virus is unavoidable and the risk of infection exists. Infants <6 months of age should never be vaccinated.

- Pregnancy: Avoid use in pregnant women unless travel to high-risk areas is unavoidable.

Dosage form specific issues:

- Gelatin: Product may contain gelatin

- Latex: Packaging may contain natural latex rubber.

Geriatric ConsiderationsNo special considerations except in patients with immunodeficient diseases.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Adverse events were not observed in the mother or fetus following vaccination during the third trimester of pregnancy in Nigerian women; however maternal seroconversion was reduced. Inadvertent exposure early in the first trimester of pregnancy in Brazilian women did not show decreased maternal seroconversion; no major congenital abnormalities were noted. Vaccine should be administered if travel to an endemic area is unavoidable and the infant should be monitored after birth. Tests to verify maternal immune response may be considered. If a pregnant woman is to be vaccinated only to satisfy an international requirement (as opposed to decreasing risk of infection), efforts should be made to obtain a waiver letter.

Lactation Excretion in breast milk unknown/contraindicated

Breast-Feeding Considerations It is recommended to avoid nursing following vaccination due to a theoretical risk of 17D virus transmission to the infant. No adverse reactions or transmission of the 17D virus have been reported. Breast-feeding is contraindicated by the manufacturer, particularly in infants <9 months of age, due to the theoretical risk of encephalitis. Breast-feeding does not adversely affect immunization. In general, live vaccines have not been found in breast milk.

Adverse Reactions **All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined (adverse reactions may be increased in patients <9 months or ≥65 years of age)

Central nervous system: Fever (incidence of these reactions have been reported to be as low as <5% and as high as 10% to 30% depending on the study), focal neurological defects, headache, seizure

Local: Injection site reactions (edema, hypersensitivity, mass, pain)

Neuromuscular & skeletal: Myalgia, weakness

Miscellaneous: Guillain-Barré syndrome, hypersensitivity (immediate), vaccine-associated neurotropic disease (rare), viscerotropic disease (rare; may be associated with multiorgan failure)

Drug Interactions

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Monitoring Parameters Monitor for adverse effects 10-30 days after vaccination.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [17D-204 strain]:

YF-VAX®: ≥4.74 Log_{10} plaque-forming units (PFU) per 0.5 mL dose [single-dose or 5-dose vial; produced in chicken embryos; contains gelatin; packaged with diluent; vial stopper contains latex]

Generic Available No

Pharmacodynamics/Kinetics

Onset of action: Seroconversion: 10-14 days

Duration: ≥30 years

Related Information

- Immunization Recommendations

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record. A hypersensitivity screening test and desensitization procedure is available for persons with suspected or known severe egg sensitivity. Consult manufacturer's labeling for details. Some countries require a valid international Certification of Vaccination showing receipt of vaccine. The WHO requires revaccination every 10 years to maintain traveler's vaccination certificate.

The following CDC agencies may be contacted if serologic testing is needed or for advice when administering yellow fever vaccine to pregnant women, children <9 months, or patients with altered immune status:

Division of Vector-Borne Infectious Diseases: 970-221-6400

Division of Global Migration and Quarantine: 404-498-1600

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Medication Safety Issues

Sound-alike/look-alike issues:

Aphrodyne® may be confused with Aprodine®

Yocon® may be confused with Zocor®

Pronunciation(yo HIM bine)

U.S. Brand NamesAphrodyne® [DSC]; Yocon®

Canadian Brand NamesPMS-Yohimbine; Yocon®

Pharmacologic CategoryMiscellaneous Product

Use: Unlabeled/InvestigationalTreatment of SSRI-induced sexual dysfunction; weight loss; impotence; sympathicolytic and mydriatic; may have activity as an aphrodisiac

Dosing: Adults

Male erectile dysfunction: Oral: 5.4 mg tablet 3 times/day have been used. If side effects occur, reduce to $^1/_2$ tablet (2.7 mg) 3 times/day followed by gradual increases to 1 tablet 3 times/day. Results of therapy >10 weeks are not known.

Orthostatic hypotension: Oral: Doses of 12.5 mg/day have been utilized; however, more research is necessary

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to yohimbine or any component of the formulation; renal disease

Warnings/Precautions

Concerns related to adverse effects:

- Nausea/vomiting: Can cause nausea or vomiting.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may cause high blood pressure and tachycardia.
- Gastrointestinal disease: Should not be used in patients with a history of gastric or duodenal ulcer.
- Psychiatric disorders: Should not be used in patients with psychiatric disorders; may cause anxiety.

Special populations:

- Elderly: Do not use in the elderly.
- Females: Generally not for use in females.
- Pediatrics: Do not use in children.
- Pregnancy: Do not use in pregnancy.

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia, hypertension, hypotension (orthostatic), flushing

Central nervous system: Anxiety, mania, hallucinations, irritability, dizziness, psychosis, insomnia, headache, panic attacks

Gastrointestinal: Nausea, vomiting, anorexia, salivation

Neuromuscular & skeletal: Tremors

Miscellaneous: Antidiuretic action, diaphoresis

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Antianxiety Agents: Yohimbine may diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Antihypertensives: Yohimbine may diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May increase the serum concentration of Yohimbine. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet, oral, as hydrochloride:

Aphrodyne®: 5.4 mg [DSC] [scored]

Tablet, as hydrochloride: 5.4 mg

Yocon®: 5.4 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Yocon)

5.4 mg (30): $25.39

Tablets (Yohimbine HCl)

5.4 mg (30): $15.99

Mechanism of ActionDerived from the bark of the yohimbe tree (*Corynanthe yohimbe*), this indole alkaloid produces a presynaptic alpha$_2$-adrenergic blockade. Peripheral autonomic effect is to increase cholinergic and decrease adrenergic activity; yohimbine exerts a stimulating effect on the mood and a mild antidiuretic effect.

Pharmacodynamics/Kinetics

Duration: Usually 3-4 hours, but may last 36 hours

Absorption: 33%

Distribution: V_d: 0.3-3 L/kg

Half-life elimination: 0.6 hour

Pharmacotherapy PearlsAlso a street drug of abuse that can be smoked; has a bitter taste. Dissociative state may resemble phencyclidine intoxication.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, irritability, dizziness, insomnia, mania, panic attacks, and psychosis

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; antidepressant should not be used with yohimbine; has been used to treat SSRI-induced sexual dysfunction

Index TermsYohimbine Hydrochloride

International Brand NamesPluriviron (DE); Virigen (DK); Yocon (DE); Yocoral (FR); Yohimbin Spiegel (DE, HU); Yohimbine Houde (FR, LU); Yohydrol (BR)

Zafirlukast

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Accolate® may be confused with Accupril®, Accutane®, Aclovate®

Pronunciation(za FIR loo kast)
U.S. Brand NamesAccolate®
Canadian Brand NamesAccolate®
Pharmacologic CategoryLeukotriene Receptor Antagonist
Use: Labeled IndicationsProphylaxis and chronic treatment of asthma in adults and children ≥5 years of age
Dosing: Adults**Asthma:** Oral: 20 mg twice daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Asthma:** Oral:

Children 5-11 years: 10 mg twice daily. Safety and effectiveness have not been established in children <5 years of age.

Children ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Dosage adjustment not required.

Dosing: Hepatic ImpairmentClearance of zafirlukast is reduced with a greater C_{max} and AUC of 50% to 60% in patients with alcoholic cirrhosis.
Administration: OralAdminister 1 hour before or 2 hours after meals.
Dietary ConsiderationsShould be taken on an empty stomach (1 hour before or 2 hours after meals).
StorageStore tablets at controlled room temperature (20°C to 25°C; 68°F to 77°F). Protect from light and moisture; dispense in original airtight container.
ContraindicationsHypersensitivity to zafirlukast or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Eosinophilia and vasculitis: In rare cases, patients may present with systemic eosinophilia, sometimes presenting with clinical features of vasculitis consistent with Churg-Strauss syndrome, a condition which is often treated with systemic corticosteroid therapy. Healthcare providers should be alert to eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, and/or neuropathy presenting in their patients. A causal association between zafirlukast and these underlying conditions has not been established.

- Hepatotoxicity: There have been reports of hepatic adverse events (including hepatitis, hyperbilirubinemia, and hepatic failure); female patients may be at greater risk. Discontinue immediately if liver dysfunction is suspected; periodic testing of liver function may be considered (early detection is generally believed to improve the likelihood of recovery). If hepatic dysfunction is suspected (due to clinical signs/symptoms), liver function tests should be measured immediately. Do not resume or restart if hepatic function studies are consistent with dysfunction. Use caution in patients with alcoholic cirrhosis; clearance is reduced.

- Infections: An increased proportion of patients >55 years of age reported infections as compared to placebo-treated patients. These infections were mostly mild or moderate in intensity and predominantly affected the respiratory tract. Infections occurred equally in both sexes, were dose-proportional to total milligrams of zafirlukast exposure, and were associated with coadministration of inhaled corticosteroids.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <5 years of age.

Other warnings/precautions:

- Reversal of bronchospasm: Not FDA approved for use in the reversal of bronchospasm in acute asthma attacks, including status asthmaticus; therapy can be continued during acute exacerbations of asthma.

Geriatric ConsiderationsThe mean dose (mg/kg) normalized AUC and C_{max} increase and plasma clearance decreases with increasing age. In patients >65 years of age, there is a two- to threefold greater C_{max} and AUC compared to younger adults. Some studies have demonstrated slightly higher adverse effect reports in elderly compared to younger adults: Headache (4.7%), diarrhea and nausea (1.8%), and pharyngitis (1.3%). No changes in dose recommended for elderly.
Pregnancy Risk FactorB
Pregnancy ConsiderationsThere are no adequate and well-controlled trials in pregnant women. Teratogenic effects not observed in animal

studies; fetal defects were observed when administered in maternally toxic doses.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsThe manufacturer does not recommend breast-feeding due to tumorigenicity observed in animal studies.

Adverse Reactions

>10%: Central nervous system: Headache (13%)

1% to 10%:

Central nervous system: Dizziness (2%), pain (2%), fever (2%)

Gastrointestinal: Nausea (3%), diarrhea (3%), abdominal pain (2%), vomiting (2%), dyspepsia (1%)

Hepatic: ALT increased (2%)

Neuromuscular & skeletal: Back pain (2%), myalgia (2%), weakness (2%)

Miscellaneous: Infection (4%)

<1%: Postmarketing and/or case reports: Agranulocytosis, angioedema, arthralgia, behavior/mood changes, bleeding, bruising, edema, eosinophilia (systemic), eosinophilic pneumonia, hepatic failure, hepatitis, hyperbilirubinemia, hypersensitivity reactions, insomnia, malaise, pruritus, rash, suicidality, suicide, urticaria, vasculitis with clinical features of Churg-Strauss syndrome (rare)

Metabolism/Transport Effects**Substrate** of CYP2C9 (major); **Inhibits** CYP1A2 (weak), 2C8 (weak), 2C9 (moderate), 2C19 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Erythromycin: May decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Theophylline Derivatives: May decrease the serum concentration of Zafirlukast. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Zafirlukast may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Decreases bioavailability of zafirlukast by 40%.

Monitoring ParametersMonitor for improvements in air flow; monitor closely for sign/symptoms of hepatic injury; periodic monitoring of LFTs may be considered (not proved to prevent serious injury, but early detection may enhance recovery)

Nursing: Physical Assessment/MonitoringNot for use in acute asthma attack. Assess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for liver dysfunction. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor for improvements in air flow; periodic monitoring of LFTs may be considered (not proved to prevent serious injury, but early detection may enhance recovery)

Patient EducationDo not use during acute bronchospasm. Take regularly as prescribed, even during symptom-free periods. This medication should be taken on an empty stomach, 1 hour before or 2 hours after meals. Do not take more than recommended or discontinue use without consulting prescriber. Do not stop taking other antiasthmatic medications unless instructed by prescriber. Avoid aspirin or aspirin-containing medications unless approved by prescriber. You may experience headache, drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or gastric upset, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report persistent CNS or GI symptoms; muscle or back pain; weakness, fever, chills; yellowing of skin or eyes; dark urine or pale stool; or skin rash. Contact prescriber immediately if experiencing right upper abdominal pain, nausea, fatigue, itching, flu-like symptoms; swelling of the eyes, face, neck, or throat; anorexia; or worsening of condition. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10 mg, 20 mg

Generic AvailableNo

ManufacturerZeneca Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Accolate)

10 mg (60): $94.09

20 mg (60): $95.99

Mechanism of ActionZafirlukast is a selectively and competitive leukotriene-receptor antagonist (LTRA) of leukotriene D4 and E4 (LTD4 and LTE4), components of slow-reacting substance of anaphylaxis (SRSA). Cysteinyl leukotriene production and receptor occupation have been correlated with the pathophysiology of asthma, including airway edema, smooth muscle constriction, and altered cellular activity associated with the inflammatory process, which contribute to the signs and symptoms of asthma.

Pharmacodynamics/Kinetics

Protein binding: >99%, primarily to albumin

Metabolism: Extensively hepatic via CYP2C9

Bioavailability: Reduced 40% with food

Half-life elimination: 10 hours

Time to peak, serum: 3 hours

Excretion: Urine (10%); feces

Related Information

- Asthma

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, malaise, or dizziness

Mental Health: Effects on Psychiatric TreatmentReports of agranulocytosis in association with zafirlukast; monitor CBC in patients receiving clozapine and carbamazepine

Zalcitabine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(zal SITE a been)

U.S. Brand NamesHivid® [DSC]

Canadian Brand NamesHivid®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsIn combination with at least two other antiretrovirals in the treatment of patients with HIV infection; it is not recommended that zalcitabine be given in combination with didanosine, stavudine, or lamivudine due to overlapping toxicities, virologic interactions, or lack of clinical data

Dosing: Adults**HIV infection (component of combination therapy):** Oral: Daily dose: 0.75 mg every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**HIV infection:** Oral:

Children <13 years: Safety and efficacy have not been established; investigational dose: 0.01 mg/kg every 8 hours

Adolescents: Refer to adult dosing.

Dosing: Renal ImpairmentAdults:

Cl_{cr} 10-40 mL/minute: Administer 0.75 mg every 12 hours.

Cl_{cr} <10 mL/minute: Administer 0.75 mg every 24 hours.

Moderately dialyzable (20% to 50%)

Calculations

- Creatinine Clearance: Adults

Administration: OralFood decreases absorption; take on an empty stomach. Administer around-the-clock. Do not take at the same time with dapsone.

StorageTablets should be stored in tightly closed bottles at room temperature (59°F to 86°F).

ContraindicationsHypersensitivity to zalcitabine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Lactic acidosis/hepatomegaly: See "Concerns related to adverse effects" below.
- Pancreatitis: See "Concerns related to adverse effects" below.
- Peripheral neuropathy: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Esophageal/oral ulcers: There have been reports of esophageal (rare) and/or oral ulcers with use.
- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases; some cases may possibly be related to underlying hepatitis B.** Use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Pancreatitis: **[U.S. Boxed Warning]: Discontinue use immediately if pancreatitis is suspected;** careful monitoring of pancreatic enzymes and liver function tests in patients with a history of pancreatitis, increased amylase, those on parenteral nutrition, or with a history of ethanol abuse.
- Peripheral neuropathy: **[U.S. Boxed Warning]: Zalcitabine can cause severe peripheral neuropathy;** avoid use, if possible, in patients with pre-existing neuropathy or at risk of developing neuropathy. Risk factors include CD4 counts <50 cells/mm^3, diabetes mellitus, weight loss, other drugs known to cause peripheral neuropathy.

Disease-related concerns:

- Heart failure (HF): Use with caution in patients with HF; cardiomyopathy and HF have occurred.
- Hyperphosphatemia: Use with caution in patients with hyperphosphatemia.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Digitalis: Use with caution in patients on digitalis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIt is not known if zalcitabine crosses the human placenta. Animal studies have shown zalcitabine to be teratogenic, developmental toxicities were also observed. Cases of lactic acidosis/hepatic steatosis syndrome have been reported in pregnant women receiving nucleoside analogue drugs. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy in women receiving nucleoside analogues. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions

>10%:

Central nervous system: Fever (5% to 17%), malaise (2% to 13%)

Neuromuscular & skeletal: Peripheral neuropathy (28%)

1% to 10%:

Central nervous system: Headache (2%), fatigue (4%), seizure (1.3%), dizziness (1%)

Dermatologic: Rash (2% to 11%), pruritus (3% to 5%)

Endocrine & metabolic: Hypoglycemia (2% to 6%), hyperglycemia (1% to 6%), hyponatremia (4%)

Gastrointestinal: Diarrhea (<1% to 10%), abdominal pain (3% to 8%), amylase increased (3% to 8%), oral ulcers (3% to 7%), anorexia (4%), dysphagia (1% to 4%), vomiting (1% to 3%), nausea (3%), weight loss

Hematologic: Anemia (occurs as early as 2-4 weeks), granulocytopenia (usually after 6-8 weeks)

Hepatic: Abnormal hepatic function (9%), hyperbilirubinemia (2% to 5%)

Neuromuscular & skeletal: Myalgia (1% to 6%), foot pain

Respiratory: Nasal discharge (4%), cough (6%), pharyngitis (2%)

<1% (Limited to important or life-threatening): Atrial fibrillation, chest pain, constipation, edema, epistaxis, heart racing, hepatic failure, hepatitis, hepatomegaly, hypersensitivity (including anaphylaxis), hypertension, hypocalcemia, jaundice, lactic acidosis, myositis, night sweats, pain, palpitation, pancreatitis, redistribution/accumulation of body fat, syncope, tachycardia, weakness

Drug Interactions

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

LamiVUDine: May diminish the therapeutic effect of Zalcitabine. *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases peak plasma concentrations by 39%. Extent and rate of absorption may be decreased with food.

Monitoring ParametersRenal function, viral load, liver function tests, CD4 counts, CBC, serum amylase, triglycerides, calcium

Nursing: Physical Assessment/MonitoringAssess closely for any previous allergy history prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking (especially those that increase risk of peripheral neuropathy). Assess results of laboratory tests (CD4 count, renal function), therapeutic response, and adverse reactions (lactic acidosis [elevated transaminases]; gastrointestinal disturbance [nausea, vomiting, diarrhea]; myalgia; peripheral neuropathy) on a regular basis throughout therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC and serum chemistry (prior to initiation and appropriate intervals), renal function, CD4 counts, serum amylase, triglyceride, calcium, viral load

Patient EducationDo not take any new prescriptions, over-the-counter medications, or herbal products without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed; preferably on an empty stomach, 1 hour before or 2 hours after meals. Do not take antacids or other medication within 1 hour of taking this medication. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. May cause dizziness, fatigue, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, lack of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report muscle weakness or pain; tingling, numbness, or pain in toes or fingers; weakness of extremities; chest pain, palpitations, or rapid heartbeat; swelling of extremities; weight gain or loss >5 lb/week; signs of infection (eg, fever, chills, sore throat, burning urination, fatigue); unusual bleeding (eg, tarry stools, easy bruising, or blood in stool, urine, or mouth); skin rash, irritation; or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet:

Hivid®: 0.375 mg, 0.75 mg [DSC]

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Hivid)

0.375 mg (90): $176.00

0.75 mg (90): $221.00

Mechanism of ActionPurine nucleoside (cytosine) analog, zalcitabine or 2′,3′-dideoxycytidine (ddC) is converted to active metabolite ddCTP; lack the presence of the 3′-hydroxyl group necessary for phosphodiester linkages during DNA replication. As a result, viral replication is prematurely terminated. ddCTP acts as a competitor for binding sites on the HIV-RNA dependent DNA polymerase (reverse transcriptase) to further contribute to inhibition of viral replication.

Pharmacodynamics/Kinetics

Absorption: Well, but variable; decreased 39% with food

Distribution: Minimal data available; variable CSF penetration

Protein binding: <4%

Metabolism: Intracellularly to active triphosphorylated agent

Bioavailability: >80%

Half-life elimination: 2.9 hours; Renal impairment: ≤8.5 hours

Excretion: Urine (>70% as unchanged drug)

Related Information

- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV
- Perinatal HIV Guidelines

Pharmacotherapy PearlsPotential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral ulcerations and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause granulocytopenia; use caution with clozapine; concurrent use with disulfiram can enhance peripheral neuropathy; avoid combination

Anesthesia and Critical Care Concerns/Other ConsiderationsPotential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

Index TermsddC; Dideoxycytidine

Zaleplon

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ZAL e plon)

U.S. Brand NamesSonata®

Pharmacologic CategoryHypnotic, Nonbenzodiazepine

Use: Labeled IndicationsShort-term (7-10 days) treatment of insomnia (has been demonstrated to be effective for up to 5 weeks in controlled trial)

Use: DentalHas not be established

Dosing: Adults**Insomnia (short-term use):** Oral: 10 mg at bedtime (range: 5-20 mg)

Dosing: ElderlyReduce dose to 5 mg at bedtime; recommended maximum: 10 mg/day

Dosing: Renal ImpairmentNo adjustment for mild-to-moderate renal impairment; use in severe renal impairment has not been adequately studied.

Dosing: Hepatic ImpairmentMild-to-moderate impairment: 5 mg; not recommended for use in patients with severe hepatic impairment.

Administration: OralAdminister immediately before bedtime or when the patient is in bed and cannot fall asleep.

Dietary ConsiderationsAvoid taking with or after a heavy, high-fat meal; reduces absorption.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

RestrictionsC-IV

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to zaleplon or any component of the formulation

Allergy Considerations

- Zaleplon Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal thinking/behavioral changes: Hypnotics/sedatives have been associated with abnormal thinking and behavior changes including decreased inhibition, aggression, bizarre behavior, agitation, hallucinations, and depersonalization. These changes may occur unpredictably and may indicate previously unrecognized psychiatric disorders; evaluate appropriately.
- Amnesia: Can occur, do not take unless a full night's sleep and clearance of the drug from the body are possible.
- CNS depression: May cause CNS depression impairing physical and mental capabilities; patients must be cautioned about performing tasks which require mental alertness (operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted.

Disease-related concerns:

- Depression: Use with caution in patients with depression; worsening of depression, including suicidal ideation, has been reported with the use of hypnotics. Intentional overdose may be an issue in this population; prescribe least amount of medication needed.
- Drug abuse: Use with caution in patients with a history of drug dependence.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended in mild-to-moderate impairment and avoid use in severe impairment.
- Respiratory disease: Use with caution in patients with respiratory compromise, COPD, or sleep apnea.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Elderly: Use with caution in the elderly; dosage adjustment recommended.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Tartrazine (FDC yellow #5): Capsules contain tartrazine; avoid in patients with sensitivity (caution in patients with asthma).

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness.

- Rapid onset: Because of the rapid onset of action, administer immediately prior to bedtime or after the patient has gone to bed and is having difficulty falling asleep.

- Withdrawal: Abrupt discontinuance may lead to withdrawal symptoms.

Geriatric ConsiderationsIn clinical trials, elderly responded to the 5 mg dose with decreased sleep latency. As with all hypnotics, assess underlying cause of insomnia.
Pregnancy Risk FactorC
Pregnancy ConsiderationsNot recommended for use during pregnancy
LactationEnters breast milk/not recommended
Adverse Reactions

>10 %: Central nervous system: Headache (30% to 42%)

1% to 10%:

Cardiovascular: Chest pain (≥1%), peripheral edema (≤1%)

Central nervous system: Dizziness (7% to 9%), somnolence (5% to 6%), amnesia (2% to 4%), depersonalization (<1% to 2%), hypoesthesia (<1% to 2%), malaise (<1% to 2%), abnormal thinking (≥1%), anxiety (≥1%), depression (≥1%), fever (≥1%), migraine (≥1%), nervousness (≥1%), confusion (≤1%), hallucination (≤1%), vertigo (≤1%)

Dermatologic: Pruritus (≥1%), rash (≥1%), photosensitivity reaction (≤1%)

Endocrine & metabolic: Dysmenorrhea (3% to 4%)

Gastrointestinal: Nausea (6% to 8%), abdominal pain (6%), anorexia (<1% to 2%), constipation (≥1%), dyspepsia (≥1%), taste perversion (≥1%), xerostomia (≥1%), colitis (up to 1%)

Neuromuscular & skeletal: Weakness (5% to 7%), paresthesia (3%), tremor (2%), arthralgia (≥1%), arthritis (≥1%), back pain (≥1%), myalgia (≥1%), hypertonia (1%)

Ocular: Eye pain (3% to 4%), abnormal vision (<1% to 2%), conjunctivitis (≥1%)

Otic: Hyperacusis (1% to 2%), ear pain (≤1%)

Respiratory: Bronchitis (≥1%), epistaxis (≤1%)

Miscellaneous: Parosmia (<1% to 2%)

<1% (Limited to important or life-threatening): Alopecia, ALT increased, anemia, angina, AST increased, ataxia, bigeminy, bilirubinemia, bleeding gums, bundle branch block, cardiospasm, cerebral ischemia, cholelithiasis, circumoral paresthesia, CNS stimulation, cyanosis, delusions, diabetes mellitus, duodenal ulcer, dysarthria, dystonia, dysuria, ecchymosis, eosinophilia, facial paralysis, gastroenteritis, glaucoma, goiter, hematuria, hyper-/hypoglycemia, hyper-/hypotension, hyperuricemia, hypothyroidism, impotence, incontinence, intestinal obstruction, ketosis, lactose intolerance, leukocytosis, lymphocytosis, liver function tests (abnormal), lymphadenopathy, myasthenia, myositis, osteoporosis, palpitation, peptic ulcer, pericardial effusion, photophobia, ptosis, pulmonary embolus, purpura, rash, rectal bleeding, sinus bradycardia, substernal chest pain, syncope, thrombophlebitis, tongue edema, ulcerative stomatitis, urinary retention, ventricular tachycardia, vasodilation, ventricular extrasystoles

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Zaleplon. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Flumazenil: May diminish the sedative effect of Hypnotics (Nonbenzodiazepine). *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Zaleplon. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: High fat meal prolonged absorption; delayed t_{max} by 2 hours, and reduced C_{max} by 35%.

Herb/Nutraceutical: St John's wort may decrease zaleplon levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringEvaluate etiology of insomnia; failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness. Assess effectiveness and interactions of other medications. Evaluate risk for suicide and assess for history of addiction (long-term use may result in dependence, abuse, or tolerance). Prescription quantities should not exceed a 1 month supply; periodically evaluate need for continued use. Be alert to possibility of anaphylaxis any time during therapy. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Patient EducationTake exactly as directed; immediately before bedtime, or when you cannot fall asleep. Do not alter dosage or frequency, may be habit forming. Avoid alcohol and other prescription or OTC medications (especially medications to relieve pain, induce sleep, reduce anxiety, treat or prevent cold, coughs, or allergies) unless approved by prescriber. You may experience drowsiness, dizziness, somnolence, vertigo, lightheadedness, blurred vision (avoid driving or engaging in activities that require alertness until response to drug is known); photosensitivity (avoid exposure to direct sunlight, wear protective clothing, and sunscreen); nausea or GI discomfort (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help); constipation (increase exercise, fluids, fruit, or fiber may help); or menstrual disturbances (reversible when drug is discontinued). Discontinue drug and report any severe CNS disturbances (hallucinations, acute nervousness or anxiety, persistent sleepiness or lethargy, impaired coordination, amnesia, or impaired thought processes); skin rash or irritation; eye pain or major vision changes; respiratory difficulty; unusual swelling, especially on face or neck; chest pain; ear pain; or muscle weakness or pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 5 mg, 10 mg

Sonata®: 5 mg, 10 mg [contains tartrazine]

Generic AvailableYes

ManufacturerWyeth-Ayerst Laboratories

Pricing: U.S. (www.drugstore.com)

Capsules (Sonata)

5 mg (30): $130.62

10 mg (30): $141.10

Capsules (Zaleplon)

5 mg (100): $39.99

10 mg (100): $39.99

Mechanism of ActionZaleplon is unrelated to benzodiazepines, barbiturates, or other hypnotics. However, it interacts with the benzodiazepine GABA receptor complex. Nonclinical studies have shown that it binds selectively to the brain omega-1 receptor situated on the alpha subunit of the GABA-A receptor complex.

Pharmacodynamics/Kinetics

Onset of action: Rapid

Duration: 6-8 hours

Absorption: Rapid and almost complete; high-fat meal delays absorption

Distribution: V_d: ~1.4 L/kg

Protein binding: ~45% to 75%

Metabolism: Extensive, primarily via aldehyde oxidase to form 5-oxo-zaleplon and, to a lesser extent, by CYP3A4 to desethylzaleplon; all metabolites are pharmacologically inactive

Bioavailability: ~30%

Half-life elimination: 1 hour

Time to peak, serum: 1 hour

Excretion: Urine (~70% primarily metabolites, <1% as unchanged drug); feces (~17%)

Clearance: Plasma: Oral: 3 L/hour/kg

Related Information

- CMS: Long-Term Care Facility Thresholds
- Nonbenzodiazepine Anxiolytics and Hypnotics

Pharmacotherapy PearlsPrescription quantities should not exceed a 1-month supply.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep. Zaleplon may be associated with a lower potential for abuse compared to benzodiazepines.

International Brand NamesHegon (AR); Hipnodem (AR); Noctiplon (CN); Plenidon (CN, PE); Prox (UY); Siweitan (CL); Sonata (AT, BE, BG, BR, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, MX, NL, NO, PL, PT, RU, SE, TR); Zaplon (IN); Zerene (AT, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, NL, NO, PT, RU, SE, TR)

Special Alerts

CDC Interim Recommendations Concerning Use of Antivirals During 2008-09 Influenza Season - December 2008

The Centers for Disease Control (CDC) has issued a Health Advisory with interim recommendations for chemoprophylaxis or influenza treatment with the following antiviral agents: Oseltamivir (Tamiflu®), zanamivir (Relenza®), rimantadine (Flumadine®), amantadine (Symmetrel®).

The recommendations were prompted by preliminary data in a limited number of states indicating a high prevalence of the oseltamivir-resistant influenza A (H1N1) strain. Influenza activity remains low at the present time, but of the 50 H1N1 isolates from 12 states tested between October 1 and December 19, 2008, 49 (98%) were resistant to oseltamivir. The CDC is unable to make any accurate predictions of which influenza virus types (A or B) or subtypes of influenza A (H1N1 or H3N2) will predominate during the 2008-09 season, but based on the current findings, the following recommendations have been made:

- Patients testing positive for influenza type B: If treatment is indicated, patients may receive either oseltamivir or zanamivir (no preference).

- Patients testing positive for influenza type A (or patients testing negative for influenza, but likelihood of influenza infection is high): If treatment is indicated, patient may receive zanamivir. If zanamivir therapy is inappropriate (eg, patients with chronic respiratory disease, patients <7 years of age) or zanamivir is unavailable, combination treatment with oseltamivir and rimantadine is acceptable (if rimantadine is unavailable, amantadine may be substituted). Oseltamivir monotherapy should only be used if local surveillance indicates that influenza A (H3N2) or influenza type B viruses are likely.

- If confirmatory diagnostic testing to distinguish between subtypes of influenza A (H1N1 or H3N2) is available, and treatment is indicated:

    Patients testing positive for influenza A (H3N2): Use oseltamivir or zanamivir (no preference)

    Patients testing positive for influenza A (H1N1): Use zanamivir (or combination treatment with oseltamivir and rimantadine as an alternative)

Patients requiring chemoprophylaxis due to potential exposure with laboratory-confirmed influenza A (H3N2) or influenza B should receive oseltamivir or zanamivir. Patients requiring chemoprophylaxis due to influenza A (H1N1) virus should receive zanamivir (or rimantadine, if zanamivir use contraindicated).

The CDC is reminding clinicians to continue to vaccinate patients using the influenza vaccine, which is expected to be effective against all circulating influenza vaccines, including the oseltamivir-resistant strain.

For additional information, including the CDC Health Advisory, please refer to http://www2a.cdc.gov/HAN/ArchiveSys/ViewMsgV.asp?AlertNum=00279

Zanamivir (Relenza®) Associated With Neuropsychiatric Events - April 2, 2008

GlaxoSmithKline, in conjunction with the U.S. Food and Drug Administration (FDA), has issued a Dear Healthcare Professional letter concerning postmarketing reports of neuropsychiatric events in patients receiving neuraminidase inhibitors, including zanamivir (Relenza®). These events include hallucination, delirium, seizure, and abnormal behavior, which in some cases have led to injury (with fatalities). The reported events primarily occurred in pediatric patients from Japan and often had a sudden onset with rapid resolution. Although the role of zanamivir in the development of these events has not been established, the prescribing information has been revised to acknowledge their occurrence.

Patients with influenza (particularly pediatric patients) may be more susceptible to the development of adverse events (seizures, confusion, abnormal behavior) early in the course of their illness regardless of whether zanamivir therapy has been initiated. Additionally, adverse events may occur in the presence of encephalitis or encephalopathy, or in the absence of marked disease. Patients receiving zanamivir should be closely monitored for any unusual behavior and healthcare professionals should be notified immediately if such signs occur.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Relenza

Pronunciation(za NA mi veer)

U.S. Brand NamesRelenza®
Canadian Brand NamesRelenza®
Pharmacologic CategoryAntiviral Agent; Neuraminidase Inhibitor
Use: Labeled IndicationsTreatment of uncomplicated acute illness due to influenza virus A and B in patients who have been symptomatic for no more than 2 days; prophylaxis against influenza virus A and B

The Advisory Committee on Immunization Practices (ACIP) recommends that **treatment** be considered for the following:

- Persons hospitalized with laboratory confirmed influenza (may also have benefit if started >48 hours after onset of illness).
- Persons with laboratory confirmed influenza pneumonia.
- Persons with laboratory confirmed influenza and bacterial infections.
- Persons with laboratory confirmed influenza and who are at higher risk for influenza complications.
- Persons presenting for care within 48 hours of laboratory confirmed influenza onset and who want to decrease duration and/or severity of their symptoms or decrease the risk of transmission to those at high risk for complications.

The ACIP recommends that **prophylaxis** be considered for the following:

- Persons at high risk for influenza infection during the first 2 weeks following vaccination (eg, children <9 years and not previously vaccinated) if the virus is circulating in the community.
- Persons at high risk for influenza infection, but the vaccination is contraindicated.
- Unvaccinated family members or healthcare providers with prolonged exposure to or close contact with high-risk persons, unvaccinated persons, or infants <6 months of age.
- Persons at high risk for influenza infection, their family members and close contacts, and healthcare workers when the circulating strain of influenza is not matched with the vaccine.
- Persons with immune deficiency or those who may not respond to vaccination.
- Unvaccinated staff and persons during response to an outbreak in a closed institutional setting that has patients at high risk for infection (eg, extended care facilities).

Dosing: Adults**Influenza virus A and B:**

Prophylaxis: Oral inhalation:

Household setting: Two inhalations (10 mg) once daily for 10 days. Begin within $1^{1}/_{2}$ days following onset of signs or symptoms of index case.

Community outbreak: Two inhalations (10 mg) once daily for 28 days. Begin within 5 days of outbreak.

Treatment: Oral inhalation: Two inhalations (10 mg total) twice daily for 5 days. Doses on first day should be separated by at least 2 hours; on subsequent days, doses should be spaced by ~12 hours. Begin within 2 days of signs or symptoms.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Influenza virus A and B:**

Prophylaxis: Oral inhalation:

Household setting: Children ≥5 years: Refer to adult dosing.

Community outbreak: Adolescents: Refer to adult dosing.

Treatment: Oral inhalation: Children ≥7 years: Refer to adult dosing.

Administration: InhalationMust be used with Diskhaler® delivery device. Patients who are scheduled to use an inhaled bronchodilator should use their bronchodilator prior to zanamivir. With the exception of the initial dose when used for treatment, administer at the same time each day.
StorageStore at controlled room temperature (25°C) 77°F. Do not puncture blister until taking a dose using the Diskhaler®.
ContraindicationsHypersensitivity to zanamivir or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Allergic-like reactions, including anaphylaxis, oropharyngeal edema, and serious skin rashes have been reported.
- Neuropsychiatric events: Rare occurrences of neuropsychiatric events (including confusion, delirium, hallucinations, and/or self-injury) have been reported from postmarketing surveillance; direct causation is difficult to establish (influenza infection may also be associated with behavioral and neurologic changes).
- Respiratory effects: Bronchospasm, decreased lung function, and other serious adverse reactions, including those with fatal outcomes, have been reported in patients with and without airway disease; discontinue with bronchospasm or signs of decreased lung function. For a patient with an underlying airway disease where a medical decision has been made to use zanamivir, a fast-acting bronchodilator should be made available, and used prior to each dose.

Disease-related concerns:

- Renal impairment: Safety and efficacy of use in patients with severe renal impairment have not been established.

- Respiratory disease: Not recommended for use in patients with underlying respiratory disease, such as asthma or COPD, due to lack of efficacy and risk of serious adverse effects.

Special populations:

- Nursing home patients: Effectiveness has not been established for prophylaxis of influenza in nursing home patients.

- Pediatrics: Indicated for children ≥5 years of age (for influenza prophylaxis) and children ≥7 years of age (for influenza treatment); children ages 5-6 years may have inadequate inhalation (via Diskhaler®) for the treatment of influenza.

Dosage form specific issues:

- Lactose: Powder for oral inhalation contains lactose.

Other warnings/precautions:

- Appropriate use: No data are available to support the use of this drug in patients who begin use for treatment after 48 hours of symptoms. Effectiveness has not been established in patients with significant underlying medical conditions. Not a substitute for annual flu vaccination; has not been shown to reduce risk of transmission of influenza to others. Patients must be instructed in the use of the delivery system. Consider primary or concomitant bacterial infections. Safety and efficacy of repeated courses have not been established.

Geriatric ConsiderationsA recent study demonstrated that most elderly were unable to use an inhaler device effectively.

Pregnancy Risk FactorC

Pregnancy ConsiderationsZanamivir has been shown to cross the placenta in animal models, however, no evidence of fetal malformations has been demonstrated. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsZanamivir has been shown to be excreted in the milk of animals, but its excretion in human milk is unknown. Caution should be used when zanamivir is administered to a nursing mother.

Adverse ReactionsMost adverse reactions occurred at a frequency which was less than or equal to the control (lactose vehicle).

>10%:

Central nervous system: Headache (prophylaxis 13% to 24%; treatment 2%)

Gastrointestinal: Throat/tonsil discomfort/pain (prophylaxis 8% to 19%)

Respiratory: Nasal signs and symptoms (prophylaxis 12% to 20%; treatment 2%), cough (prophylaxis 7% to 17%; treatment ≤2%)

Miscellaneous: Viral infection (prophylaxis 3% to 13%)

1% to 10%:

Central nervous system: Fever/chills (prophylaxis 5% to 9%; treatment <1.5%), fatigue (prophylaxis 5% to 8%; treatment <1.5%), malaise (prophylaxis 5% to 8%; treatment <1.5%), dizziness (treatment 1% to 2%)

Dermatologic: Urticaria (treatment <1.5%)

Gastrointestinal: Anorexia/appetite decreased (prophylaxis 2% to 4%), appetite increased (prophylaxis 2% to 4%), nausea (prophylaxis 1% to 2%; treatment ≤3%), diarrhea (prophylaxis 2%; treatment 2% to 3%), vomiting (prophylaxis 1% to 2%; treatment 1% to 2%), abdominal pain (treatment <1.5%)

Neuromuscular & skeletal: Muscle pain (prophylaxis 3% to 8%), musculoskeletal pain (prophylaxis 6%), arthralgia/articular rheumatism (prophylaxis 2%), arthralgia (treatment <1.5%), myalgia (treatment <1.5%)

Respiratory: Infection (ear/nose/throat; prophylaxis 2%; treatment 1% to 5%), sinusitis (treatment 3%), bronchitis (treatment 2%), nasal inflammation (prophylaxis 1%)

<1%: Asthma, hemorrhage (ear/nose/throat)

Postmarketing and/or case reports: Abnormal behavior, agitation, allergic or allergic-like reaction (including oropharyngeal edema), anxiety, arrhythmia, bronchospasm, confusion, consciousness altered, delirium, delusions, dyspnea, facial edema, hallucinations, nightmares, rash (including serious cutaneous reactions), seizure, syncope

Drug Interactions

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringTherapy for treatment must be started within 48 hours of first influenza symptoms. Monitor for change in behavior. Teach patient appropriate use (inhalation device), interventions to reduce side effects, and adverse reactions to report.

Patient EducationThis is **not** a substitute for the influenza vaccine. Use delivery device exactly as directed; complete full regimen, even if symptoms improve sooner. If you have asthma or COPD you may be at risk for bronchospasm; see prescriber for appropriate bronchodilator before using zanamivir. Stop using this medication and contact your prescriber if you experience shortness of breath, increased wheezing, or other signs of bronchospasm. You may experience dizziness or headache (use caution when driving or engaging in hazardous tasks until response to drug is known), sore throat, or nasal congestion. Report unresolved diarrhea, vomiting, or nausea; acute fever or muscle pain;

change in behavior, including hallucinations, confusion, delirium, or seizures; or other acute and persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral inhalation: 5 mg/blister (20s) [4 blisters per Rotadisk® foil pack, 5 Rotadisk® per package; packaged with Diskhaler® inhalation device; contains lactose]

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Aerosol powder (Relenza Diskhaler)

5 mg/blister (20): $63.99

Mechanism of ActionZanamivir inhibits influenza virus neuraminidase enzymes, potentially altering virus particle aggregation and release.

Pharmacodynamics/Kinetics

Absorption: Inhalation: ~4% to 17%

Protein binding, plasma: <10%

Metabolism: None

Half-life elimination, serum: 2.5-5.1 hours

Excretion: Urine (as unchanged drug); feces (unabsorbed drug)

Related Information

- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsMajority of patients included in clinical trials were infected with influenza A, however, a number of patients with influenza B infections were also enrolled. Patients with lower temperature or less severe symptoms appeared to derive less benefit from therapy. No consistent treatment benefit was demonstrated in patients with chronic underlying medical conditions.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsPatients with asthma or COPD should be informed of the risk of bronchospasm and should have a fast-acting bronchodilator available when treated with zanamivir. Majority of patients included in clinical trials were infected with influenza A, however, a number of patients with influenza B infections were also enrolled. Patients with lower temperature or less severe symptoms appeared to derive less benefit from therapy. No consistent treatment benefit was demonstrated in patients with chronic underlying medical conditions.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(zi KOE no tide)

U.S. Brand NamesPrialt®

Pharmacologic CategoryAnalgesic, Nonopioid; Calcium Channel Blocker, N-Type

Use: Labeled IndicationsManagement of severe chronic pain in patients requiring intrathecal (I.T.) therapy and who are intolerant or refractory to other therapies

Dosing: Adults**Chronic pain:** I.T.: Initial dose: ≤2.4 mcg/day (0.1 mcg/hour)

Dose may be titrated by ≤2.4 mcg/day (0.1 mcg/hour) at intervals ≤2-3 times/week to a maximum dose of 19.2 mcg/day (0.8 mcg/hour) by day 21; average dose at day 21: 6.9 mcg/day (0.29 mcg/hour). A faster titration should be used only if the urgent need for analgesia outweighs the possible risk to patient safety.

Dosing: ElderlyRefer to adult dosing. Use with caution.

Dosing: Adjustment for Toxicity

Cognitive impairment: Reduce dose or discontinue. Effects are generally reversible within 3-15 days of discontinuation.

Reduced level of consciousness: Discontinue until event resolves.

CK elevation with neuromuscular symptoms: Consider dose reduction or discontinuation.

Administration: I.V.**Not for I.V. administration**

Administration: OtherNot for I.V. administration. **For I.T. administration only** using Medtronic SynchroMed® EL, SynchroMed® II Infusion System, or CADD-Micro® ambulatory infusion pump.

Medtronic SynchroMed® EL or SynchroMed® II Infusion Systems:

Naive pump priming (first time use with ziconotide): Use 2 mL of undiluted ziconotide 25 mcg/mL solution to rinse the internal surfaces of the pump; repeat twice for a total of 3 rinses

Initial pump fill: Use only undiluted 25 mcg/mL solution and fill pump after priming. Following the initial fill only, adsorption on internal device surfaces will occur, requiring the use of the undiluted solution and refill within 14 days.

Pump refills: Contents should be emptied prior to refill. Subsequent pump refills should occur at least every 40 days if using diluted solution or at least every 84 days if using undiluted solution.

CADD-Micro® ambulatory infusion pump: Refer to manufacturers' manual for initial fill and refill instructions

pH: 4-5

StoragePrior to use, store vials at 2°C to 8°C (36°F to 46°F). Once diluted, may be stored at 2°C to 8°C (36°F to 46°F) for 24 hours; refrigerate during transit. Do not freeze. Protect from light.

When using the Medtronic SynchroMed® EL or SynchroMed® II Infusion System, solutions expire as follows:

25 mcg/mL: Undiluted:

Initial fill: Use within 14 days.

Refill: Use within 84 days.

100 mcg/mL:

Undiluted: Refill: Use within 84 days.

Diluted: Refill: Use within 40 days.

ReconstitutionPreservative free NS should be used when dilution is needed.

CADD-Micro® ambulatory infusion pump: Initial fill: Dilute to final concentration of 5 mcg/mL.

Medtronic SynchroMed® EL or SynchroMed® II infusion system: Prior to initial fill, rinse internal pump surfaces with 2 mL ziconotide (25 mcg/mL), repeat twice. Only the 25 mcg/mL concentration (undiluted) should be used for initial pump fill.

Contraindications Hypersensitivity to ziconotide or any component of the formulation; history of psychosis; I.V. administration

I.T. administration is contraindicated in patients with infection at the injection site, uncontrolled bleeding, or spinal canal obstruction that impairs CSF circulation

Warnings/Precautions

Boxed warnings:

- CNS toxicity: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- CNS toxicity: **[U.S Boxed Warning]: Severe psychiatric symptoms and neurological impairment have been reported;** interrupt or discontinue therapy if cognitive impairment, hallucinations, mood changes, or changes in consciousness occur. May cause or worsen depression and/or risk of suicide. Cognitive impairment may appear gradually during treatment and is generally reversible after discontinuation (may take up to 2 weeks for cognitive effects to reverse). May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Elevated serum creatine kinase: With use, elevated serum creatine kinase can occur; particularly during the first 2 months of therapy. Consider dose reduction or discontinuing if combined with new neuromuscular symptoms (myalgias, myasthenia, muscle cramps, weakness) or reduction in physical activity.

- Meningitis: May occur with use of I.T. pumps; monitor for signs of meningitis; treatment of meningitis may require removal of system and discontinuation of intrathecal therapy.

Disease-related concerns:

- Hepatic impairment: Safety and efficacy have not been established in patients with hepatic impairment.

- Renal impairment: Safety and efficacy have not been established in patients with renal impairment.

Concurrent drug therapy issues:

- CNS depressants: May have additive effects with CNS-depressant medications.

- Opiates: May have additive CNS effects with opiates and may potentiate opioid-induced decreased GI motility; does not interact with opioid receptors or potentiate opiate-induced respiratory depression.

Special populations:

- Elderly: Use with caution in the elderly; may experience a higher incidence of confusion.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Withdrawal: Will not prevent or relieve symptoms associated with opiate withdrawal; unlike opioids, ziconotide therapy can be interrupted abruptly or discontinued without evidence of withdrawal.

Geriatric Considerations Manufacturer reports that in all trials there was a higher incidence of confusion in the elderly compared to younger adults.

Pregnancy Risk Factor C

Pregnancy Considerations Teratogenic effects were not observed in animal studies, but increased postimplantation pup loss was reported. Maternal toxicity was also noted. There are no adequate and well-controlled studies in pregnant women.

Lactation Excretion in breast milk unknown/not recommended

Breast-Feeding Considerations The manufacturer recommends discontinuing breast-feeding or discontinuing ziconotide.

Adverse Reactions

>10%:

Central nervous system: Dizziness (46%), confusion (15% to 33%), memory impairment (7% to 22%), somnolence (17%), ataxia (14%), speech disorder (14%), headache (13%), aphasia (12%), hallucination (12%; including auditory and visual)

Gastrointestinal: Nausea (40%), diarrhea (18%), vomiting (16%)

Neuromuscular & skeletal: Creatine kinase increased (40%; ≥3 times ULN: 11%), weakness (18%), gait disturbances (14%)

Ocular: Blurred vision (12%)

2% to 10%:

Cardiovascular: Hypotension, peripheral edema, postural hypotension

Central nervous system: Abnormal thinking (8%), amnesia (8%), anxiety (8%), vertigo (7%), insomnia (6%), fever (5%), paranoid reaction (3%), delirium (2%), hostility (2%), stupor (2%), agitation, attention disturbance, balance impaired, burning sensation, coordination abnormal, depression, disorientation, fatigue, fever, hypoesthesia, irritability, lethargy, mental impairment, mood disorder, nervousness, pain, sedation

Dermatologic: Pruritus (7%)

Gastrointestinal: Anorexia (6%), taste perversion (5%), abdominal pain, appetite decreased, constipation, xerostomia

Genitourinary: Urinary retention (9%), dysuria, urinary hesitance

Neuromuscular & skeletal: Dysarthria (7%), paresthesia (7%), rigors (7%), tremor (7%), muscle spasm (6%), limb pain (5%), areflexia, muscle cramp, muscle weakness, myalgia

Ocular: Nystagmus (8%), diplopia, visual disturbance

Respiratory: Sinusitis (5%)

Miscellaneous: Diaphoresis (5%)

<2%, postmarketing, and/or case reports: Acute renal failure, aspiration pneumonia (<1%), atrial fibrillation, cerebral vascular accident, ECG abnormalities, incoherence, loss of consciousness, mania, meningitis, myoclonus, psychosis (1%), psychotic disorder, respiratory distress, rhabdomyolysis, seizure (clonic and grand mal), sepsis, suicidal ideation, suicide attempt (<1%)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS adverse effects).

Monitoring ParametersMonitor for psychiatric or neurological impairment; signs and symptoms of meningitis or other infection; serum CPK (every other week for first month then monthly); pain relief

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. This medication is given intrathecally via pump. Monitor for therapeutic response. Monitor for changes in behavior, cognitive impairment, hallucinations, or changes in mood or consciousness. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCPK (every other week for first month, then monthly)

Patient EducationAvoid alcohol, other prescriptions, or OTC medications (especially sedatives, tranquilizers, antihistamines, and other pain medications) without consulting prescriber. You may experience dizziness, sleepiness, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or loss of appetite. Report chest pain, swelling of extremities (feet/ankles); muscle weakness and poor coordination; hallucinations, confusion, or extreme weakness. **Pregnancy/breast-feeding precaution:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as acetate [preservative free]:

Prialt®: 25 mcg/mL (20 mL); 100 mcg/mL (1 mL, 5 mL)

Generic AvailableNo

ManufacturerElan Pharmaceuticals, Inc

Mechanism of ActionZiconotide selectively binds to N-type voltage-sensitive calcium channels located on the nociceptive afferent nerves of the dorsal horn in the spinal cord. This binding is thought to block N-type calcium channels, leading to a blockade of excitatory neurotransmitter release and reducing sensitivity to painful stimuli.

Pharmacodynamics/Kinetics

Distribution: I.T.: V_d: ~140 mL

Protein binding: ~50%

Metabolism: Metabolized via endopeptidases and exopeptidases present on multiple organs including kidney, liver, lung; degraded to peptide fragments and free amino acids

Half-life elimination: I.V.: 1-1.6 hours (plasma); I.T.: 2.9-6.5 hours (CSF)

Excretion: I.V.: Urine (<1%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and sedation are common. May cause hallucinations, mood changes, cognitive impairment, changes in consciousness, anxiety, nervousness, agitation, abnormal dreams, insomnia, or hostility.

Mental Health: Effects on Psychiatric TreatmentContraindicated in individuals with a history of psychosis. Concomitant use with psychotropic agents may produce additive sedative effects; monitor. GI side effects are common; concomitant use with SSRIs, valproic acid, or lithium may produce additive effects; monitor.

Medication Safety Issues

Sound-alike/look-alike issues:

Combivir® may be confused with Combivent®, Epivir®

AZT is an error-prone abbreviation (mistaken as azaTHIOprine, aztreonam)

Pronunciation(zye DOE vyoo deen & la MI vyoo deen)

U.S. Brand NamesCombivir®

Canadian Brand NamesCombivir®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infection when therapy is warranted based on clinical and/or immunological evidence of disease progression

Dosing: Adults**Treatment of HIV infection:** Oral: 1 tablet twice daily. Because this is a fixed-dose combination product, avoid use in patients requiring dosage reduction including children <12 years of age, renally-impaired patients with a creatinine clearance ≤50 mL/minute, hepatic impairment, or those patients experiencing dose-limiting adverse effects.

Dosing: ElderlySee Geriatric Considerations.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

StorageStore between 2°C and 30°C (36°F and 86°F).

ContraindicationsHypersensitivity to lamivudine, zidovudine, or any component of the formulation

Allergy Considerations

- LamiVUDine Allergy
- Zidovudine Allergy

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Hematologic toxicity: See “Concerns related to adverse effects” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.
- Myopathy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hematologic toxicity: **[U.S. Boxed Warning]: Zidovudine is associated with hematologic toxicity including neutropenia and severe anemia.** Use with caution in patients with bone marrow compromise (granulocytes <1000 cells/mm^3 or hemoglobin <9.5 mg/dL).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Myopathy: **[U.S. Boxed Warning]: Prolonged use of zidovudine has been associated with symptomatic myopathy and myositis.**

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Monitor closely for chronic hepatitis B for several months following discontinuation of therapy** in patients coinfected with HBV and HIV; clinical exacerbations may occur and may warrant antihepatitis B therapy.
- Hepatic impairment: Combivir® is not recommended for use in patients with hepatic impairment.
- Renal impairment: Combivir® is not recommended for use in patients with renal (Cl_{cr}<50 mL/minute).

Concurrent drug therapy issues:

- Interferon alfa: Use with caution in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected patients; monitor closely for hepatic decompensation, anemia, or neutropenia; dose reduction or discontinuation of interferon and/or ribavirin may be required if toxicity evident.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationSee individual agents.
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsZidovudine: **Substrate** (minor) of CYP2A6, 2C9, 2C19, 3A4
Drug Interactions

Acyclovir-Valacyclovir: May enhance the CNS depressant effect of Zidovudine. *Risk C: Monitor therapy*

DOXOrubicin: May enhance the adverse/toxic effect of Zidovudine. DOXOrubicin may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

DOXOrubicin (Liposomal): May enhance the adverse/toxic effect of Zidovudine. DOXOrubicin (Liposomal) may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

Emtricitabine: LamiVUDine may enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Fluconazole: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Interferons: May enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Methadone: May increase the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Probenecid: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Zidovudine. **Exceptions:** Rifabutin. *Risk D: Consider therapy modification*

Stavudine: Zidovudine may diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Valproic Acid: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Zalcitabine: LamiVUDine may diminish the therapeutic effect of Zalcitabine. *Risk D: Consider therapy modification*

Monitoring ParametersAmylase, bilirubin, signs and symptoms of pancreatitis. Monitor CBC with differential and platelet count at least every 2 weeks, liver function tests (including signs/symptoms of hepatomegaly), MCV, serum creatinine kinase, viral load, and CD4 count; observe for appearance of opportunistic infections; signs of muscle weakness or pain; blood lactate levels and signs of acidosis
Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsAmylase, bilirubin; monitor CBC with differential and platelet count at least every 2 weeks, liver function tests (including signs/symptoms of hepatomegaly), MCV, serum creatinine kinase, viral load, and CD4 count; blood lactate levels and signs of acidosis
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Combivir®: Zidovudine 300 mg and lamivudine 150 mg

Generic AvailableNo
ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Tablets (Combivir)

150-300 mg (30): $411.19

Mechanism of ActionThe combination of zidovudine and lamivudine is believed to act synergistically to inhibit reverse transcriptase via DNA chain termination after incorporation of the nucleoside analogue as well as to delay the emergence of mutations conferring resistance
Pharmacodynamics/KineticsSee individual agents.

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Azidothymidine may be confused with azaTHIOprine, aztreonam

Retrovir® may be confused with ritonavir

AZT is an error-prone abbreviation (mistaken as azathioprine, aztreonam)

Pronunciation(zye DOE vyoo deen)

U.S. Brand NamesRetrovir®

Canadian Brand NamesApo-Zidovudine®; AZT™; Retrovir®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infection in combination with at least two other antiretroviral agents; prevention of maternal/fetal HIV transmission as monotherapy

Use: Unlabeled/InvestigationalPostexposure prophylaxis for HIV exposure as part of a multidrug regimen

Dosing: Adults

Prevention of maternal-fetal HIV transmission: Maternal (per AIDSinfo guidelines): 100 mg 5 times/day **or** 200 mg 3 times/day **or** 300 mg twice daily. Begin at 14-34 weeks gestation and continue until start of labor.

Note: Consider use of zidovudine in combination with nevirapine (and possibly lamivudine) in select situations (eg, infants born to mothers with suboptimal viral suppression at delivery, infants born to mothers with only intrapartum therapy or no therapy, or infants born to mothers with known antiretroviral drug-resistant virus) (AIDSinfo guidelines, July 2008).

During labor and delivery, administer zidovudine I.V. at 2 mg/kg as loading dose followed by a continuous I.V. infusion of 1 mg/kg/hour until the umbilical cord is clamped

HIV infection:

Oral: 300 mg twice daily or 200 mg 3 times/day

I.V.: 1 mg/kg/dose administered every 4 hours around-the-clock (5-6 doses/day)

Prevention of HIV following needlesticks (unlabeled use): Oral: 200 mg 3 times/day plus lamivudine 150 mg twice daily; a protease inhibitor (eg, indinavir) may be added for high risk exposures; begin therapy within 2 hours of exposure if possible

Note: Patients should receive I.V. therapy only until oral therapy can be administered

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Prevention of maternal-fetal HIV transmission (in neonates):Note: Consider use of zidovudine in combination with nevirapine (and possibly lamivudine) in select situations (eg, infants born to mothers with suboptimal viral suppression at delivery, infants born to mothers with only intrapartum therapy or no therapy, or infants born to mothers with known antiretroviral drug-resistant virus) (AIDSinfo guidelines, July 2008).

Note: Dosing should begin 6-12 hours after birth and continue for the first 6 weeks of life.

Oral:

Full-term infants: 2 mg/kg/dose every 6 hours

Infants ≥30 weeks and <35 weeks gestation at birth: 2 mg/kg/dose every 12 hours; at 2 weeks of age, advance to 2 mg/kg/dose every 8 hours

Infants <30 weeks gestation at birth: 2 mg/kg/dose every 12 hours; at 4 weeks of age, advance to 2 mg/kg/dose every 8 hours

I.V. (infants unable to receive oral dosing):

Full term: 1.5 mg/kg/dose every 6 hours

Infants ≥30 weeks and <35 weeks gestation at birth: 1.5 mg/kg/dose every 12 hours; at 2 weeks of age, advance to 1.5 mg/kg/dose every 8 hours

Infants <30 weeks gestation at birth: 1.5 mg/kg/dose every 12 hours; at 4 weeks of age, advance to 1.5 mg/kg/dose every 8 hours

Maternal: During labor and delivery, administer zidovudine I.V. at 2 mg/kg over 1 hour followed by a continuous I.V. infusion of 1 mg/kg/hour until the umbilical cord is clamped

Treatment of HIV infection: Children 6 weeks to 12 years:

Oral: Dose should be calculated by body weight (in kg) or body surface area and should not exceed the recommended adult dose. **Note:** Doses calculated by body weight may not be the same as those calculated by body surface area.

Dosing based on body surface area: 160 mg/m^2/dose every 8 hours **or** 240 mg/m^2 every 12 hours (maximum: 200 mg every 8 hours); some Working Group members use a dose of 180 mg/m^2 to 240 mg/m^2 every 12 hours when using in drug combinations with other antiretroviral compounds, but data on this dosing in children is limited.

Dosing based on weight:

4 to <9 kg: 12 mg/kg/dose twice daily **or** 8 mg/kg/dose 3 times a day

≥9 to <30 kg: 9 mg/kg/dose twice daily **or** 6 mg/kg/dose 3 times a day

≥30 kg: 300 mg twice daily **or** 200 mg 3 times a day

I.V. continuous infusion: 20 mg/m^2/hour

I.V. intermittent infusion: 120 mg/m^2/dose every 6 hours

Dosing: Renal Impairment

Cl_{cr} <15 mL/minute including hemo-/peritoneal dialysis: 100 mg (oral) or 1 mg/kg (I.V.) every 6-8 hours

Continuous arteriovenous or venovenous hemodiafiltration effects: Administer 100 mg every 8 hours

Dosing: Hepatic ImpairmentInsufficient data to make dosing recommendation.

Dosing: Adjustment for ToxicityConsider dose interruption for significant anemia (hemoglobin <7.5 g/dL or >25% reduction from baseline) and/or neutropenia (granulocyte count <750 $cells/mm^3$ or >50% reduction from baseline) until evidence of recovery. Anemia associated with chronic zidovudine may warrant dose reduction.

Calculations

- Body Surface Area: Pediatrics

Administration: I.M.Do not give I.M.

Administration: I.V.Avoid rapid infusion or bolus injection

Neonates: Infuse over 30 minutes

Adults: Infuse loading dose over 1 hour, followed by continuous infusion

Administration: I.V. DetailpH: 5.5

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. Oral zidovudine may be administered without regard to food.

Dietary ConsiderationsMay be taken without regard to food.

StorageStore undiluted vials at 15°C to 25°C (59°F to 77°F). Protect from light. When diluted, solution is physically and chemically stable for 24 hours at room temperature and 48 hours if refrigerated.

ReconstitutionSolution for injection should be diluted with D_5W to a concentration ≤4 mg/mL. Attempt to administer diluted solution within 8 hours if stored at room temperature or 24 hours if refrigerated to minimize potential for microbially-contaminated solutions.

CompatibilityStable in D_5W, NS.

Incompatible with blood products and protein solutions.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amikacin, amphotericin B, amphotericin B cholesteryl sulfate complex, aztreonam, cefepime, ceftazidime, ceftriaxone, cimetidine, cisatracurium, clindamycin, dexamethasone sodium phosphate, dobutamine, docetaxel, dopamine, doxorubicin liposome, erythromycin lactobionate, etoposide, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, imipenem/cilastatin, linezolid, lorazepam, melphalan, metoclopramide, morphine, nafcillin, ondansetron, oxacillin, paclitaxel, pentamidine, phenylephrine, piperacillin, piperacillin/tazobactam, potassium chloride, ranitidine, remifentanil, sargramostim, teniposide, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinorelbine. **Variable (consult detailed reference):** Meropenem, TPN.

Compatibility when admixed: Variable (consult detailed reference): Meropenem.

ContraindicationsLife-threatening hypersensitivity to zidovudine or any component of the formulation

Allergy Considerations

- Zidovudine Allergy

Warnings/Precautions

Boxed warnings:

- Hematologic toxicity: See “Concerns related to adverse effects” below.

- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

- Myopathy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).

- Hematologic toxicity: **[U.S. Boxed Warning]: Often associated with hematologic toxicity including granulocytopenia, severe anemia requiring transfusions, or (rarely) pancytopenia.** Use with caution in patients with bone marrow compromise (granulocytes <1000 cells/mm^3 or hemoglobin <9.5 mg/dL); dosage adjustment may be required in patients who develop anemia or neutropenia.

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

- Myopathy: **[U.S. Boxed Warning]: Prolonged use has been associated with symptomatic myopathy and myositis.**

Disease-related concerns:

- Renal impairment: Use with caution in patients with severe renal impairment; dosage adjustment recommended.

Concurrent drug therapy issues:

- Interferon alfa: Use with caution in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected patients; monitor closely for hepatic decompensation, anemia, or neutropenia; dose reduction or discontinuation of interferon and/or ribavirin may be required if toxicity evident.

Pregnancy Risk FactorC

Pregnancy ConsiderationsZidovudine crosses the placenta. No increased risk of overall birth defects has been observed following 1st trimester exposure according to data collected by the antiretroviral pregnancy registry. The use of zidovudine reduces the maternal-fetal transmission of HIV by ~70% and should be considered for antenatal and intrapartum therapy whenever possible. The Perinatal HIV Guidelines Working Group considers zidovudine the preferred NRTI for use in combination regimens during pregnancy. In HIV-infected mothers not previously on antiretroviral therapy, treatment may be delayed until after 10-12 weeks gestation. Cases of lactic acidosis/hepatic steatosis syndrome have been reported in pregnant women receiving nucleoside analogues. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy in women receiving nucleoside analogues. Women in labor with an unknown HIV status should have a rapid HIV test. If the test is positive, begin I.V. zidovudine therapy. (If a postpartum confirmatory test is negative, zidovudine therapy in the infant can be stopped). Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsAs reported in adult patients with asymptomatic HIV infection. Frequency and severity may increase with advanced disease.

>10%:

Central nervous system: Headache (63%), malaise (53%)

Gastrointestinal: Nausea (51%), anorexia (20%), vomiting (17%)

1% to 10%:

Gastrointestinal: Constipation (6%)

Hematologic: Granulocytopenia (2%; onset 6-8 weeks), anemia (1%; onset 2-4 weeks)

Hepatic: Transaminases increased (1% to 3%)

Neuromuscular & skeletal: Weakness (9%)

Frequency not defined:

Cardiovascular: Cardiomyopathy, chest pain, syncope, vasculitis

Central nervous system: Anxiety, chills, confusion, depression, dizziness, fatigue, insomnia, loss of mental acuity, mania, seizure, somnolence, vertigo

Dermatologic: Pruritus, rash, skin/nail pigmentation changes, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Body fat redistribution, gynecomastia

Gastrointestinal: Abdominal cramps, abdominal pain, dyspepsia, dysphagia, flatulence, mouth ulcer, oral mucosa pigmentation, pancreatitis, taste perversion

Genitourinary: Urinary frequency, urinary hesitancy

Hematologic: Aplastic anemia, hemolytic anemia, leukopenia, lymphadenopathy, pancytopenia with marrow hypoplasia, pure red cell aplasia

Hepatic: Hepatitis, hepatomegaly with steatosis, hyperbilirubinemia, jaundice, lactic acidosis

Neuromuscular & skeletal: Arthralgia, back pain, CPK increased, LDH increased, musculoskeletal pain, myalgia, neuropathy, muscle spasm, myopathy, myositis, paresthesia, rhabdomyolysis, tremor

Ocular: Amblyopia, macular edema, photophobia

Otic: Hearing loss

Respiratory: Cough, dyspnea, rhinitis, sinusitis

Miscellaneous: Allergic reactions, anaphylaxis, angioedema, diaphoresis, flu-like syndrome, immune reconstitution syndrome

Metabolism/Transport Effects **Substrate** (minor) of CYP2A6, 2C9, 2C19, 3A4

Drug Interactions

Acyclovir-Valacyclovir: May enhance the CNS depressant effect of Zidovudine. *Risk C: Monitor therapy*

DOXOrubicin: May enhance the adverse/toxic effect of Zidovudine. DOXOrubicin may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

DOXOrubicin (Liposomal): May enhance the adverse/toxic effect of Zidovudine. DOXOrubicin (Liposomal) may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Interferons: May enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Methadone: May increase the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Probenecid: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Zidovudine. **Exceptions:** Rifabutin. *Risk D: Consider therapy modification*

Stavudine: Zidovudine may diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring Parameters Monitor CBC and platelet count at least every 2 weeks, liver function tests, MCV, serum creatinine kinase, viral load, and CD4 count; observe for appearance of opportunistic infections

Nursing: Physical Assessment/Monitoring Assess closely for any previous allergy history prior to beginning treatment. Use caution in presence of bone marrow compromise, risk factors for liver disease, or renal impairment; dose reduction may be necessary. Assess other pharmacological or herbal products patient may be taking (eg, increased risk of nephrotoxicity, hepatotoxicity, lactic acidosis), especially those that increase risk of peripheral neuropathy. Assess results of laboratory tests (CD4 count and viral load, CBC and platelet count, LFTs), therapeutic response, and adverse reactions on a regular basis throughout therapy (eg, lactic acidosis [elevated transaminases], anemia, neutropenia, hepatic decompensation, gastrointestinal disturbance [nausea, vomiting, diarrhea], myalgia, peripheral neuropathy). Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests Monitor CBC and platelet count at least every 2 weeks, liver function tests, MCV, serum creatinine kinase, CD4 cell count, viral load

Patient Education Do not take any new prescription or over-the-counter medications or herbal products during therapy without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. Avoid alcohol to decrease risk of hypersensitivity reaction. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug). May cause headache, dizziness, or weakness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting; mouth sores (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased dietary fluid and fibers may help); CNS changes (anxiety, chills, confusion, depression, loss of mental acuity, or seizures - contact prescriber); or back or muscle pain (if persistent contact prescriber for appropriate analgesic). Report excessive fatigue, easy bruising or bleeding, change in urinary pattern, dark urine or light stool, chest pain or palpitations, rash or skin sores, muscle or bone pain, or tremor. **Note:** Stop drug and report immediately symptoms of hypersensitivity/allergic reaction (eg, swelling of lips, face, mouth or throat; rash; difficulty breathing or chest tightness; excessive sweating; numbness or loss of sensation). Do not restart without specific instruction by your prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Retrovir®: 100 mg

Injection, solution [preservative free]:

Retrovir®: 10 mg/mL (20 mL)

Syrup:

Retrovir®: 50 mg/5 mL (240 mL) [contains sodium benzoate; strawberry flavor]

Tablet: 300 mg

Retrovir®: 300 mg

Generic AvailableYes: Tablet
Pricing: U.S. (www.drugstore.com)

Capsules (Retrovir)

100 mg (180): $415.46

Syrup (Retrovir)

50 mg/5 mL (240): $59.14

Tablets (Retrovir)

300 mg (60): $418.15

Tablets (Zidovudine)

300 mg (60): $170.00

Mechanism of ActionZidovudine is a thymidine analog which interferes with the HIV viral RNA-dependent DNA polymerase resulting in inhibition of viral replication; nucleoside reverse transcriptase inhibitor
Pharmacodynamics/Kinetics

Distribution: Significant penetration into the CSF; crosses placenta

V_d: 1-2.2 L/kg

Relative diffusion from blood into CSF: Adequate with or without inflammation (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: ~60%

Protein binding: 25% to 38%

Metabolism: Hepatic via glucuronidation to inactive metabolites; extensive first-pass effect

Bioavailability: 54% to 74%

Half-life elimination: Terminal: 0.5-3 hours

Time to peak, serum: 30-90 minutes

Excretion:

Oral: Urine (72% to 74% as metabolites, 14% to 18% as unchanged drug)

I.V.: Urine (45% to 60% as metabolites, 18% to 29% as unchanged drug)

Pharmacotherapy PearlsPotential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion, oral mucosa pigmentation, dysphagia, and mouth ulcer.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause anxiety, confusion, depression, dizziness, drowsiness, insomnia, or mania
Mental Health: Effects on Psychiatric TreatmentGranulocytopenia is common; avoid clozapine and carbamazepine. Valproic acid may decrease the clearance of zidovudine. GI side effects are common; concurrent use with SSRIs may produce additive effects.
Anesthesia and Critical Care Concerns/Other ConsiderationsDoes not reduce risk of transmitting HIV infections. Potential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

Zileuton

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(zye LOO ton)
U.S. Brand NamesZyflo CR™; Zyflo® [DSC]
Pharmacologic Category5-Lipoxygenase Inhibitor
Use: Labeled IndicationsProphylaxis and chronic treatment of asthma in children ≥12 years of age and adults
Dosing: Adults**Asthma:** Oral:

Zyflo®: 600 mg 4 times/day

Zyflo CR™: 1200 mg twice daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Asthma:** Oral:

Children <12 years: Safety and effectiveness have not been established.

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdjustment not necessary in renal failure or with hemodialysis.
Dosing: Hepatic ImpairmentContraindicated with hepatic dysfunction.
Administration: OralZyflo®: Administer without regard to meals (eg, with or without food). Zyflo CR™: Do not crush, cut, or chew tablet; administer with food.
Dietary ConsiderationsZyflo®: May be taken with or without food; Zyflo CR™: Take with food.
StorageStore tablets at 15°C to 30°C (59°F to 86°F). Protect from light.
ContraindicationsHypersensitivity to zileuton or any component of the formulation; active liver disease or transaminase elevations greater than or equal to three times the upper limit of normal (≥3 times ULN)
Warnings/Precautions

Concerns related to adverse effects:

- Hepatotoxicity: There have been reports of hepatic adverse effects (elevated transaminase levels); serum ALT should be monitored. Females >65 years and patients with pre-existing elevated transaminases may be at greater risk. Discontinue therapy and follow transaminases until normal if patients develop clinical signs/symptoms of liver dysfunction or with transaminase levels >5 times ULN; use caution with history of liver disease and/or in those patients who consume substantial quantities of ethanol.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Reversal of bronchospasm: Not FDA approved for the reversal of bronchospasm in acute asthma attacks, including status asthmaticus; therapy may be continued during acute asthma exacerbations.

Geriatric ConsiderationsNo differences in the pharmacokinetics found between younger adults and elderly; no dosage adjustments necessary. However, monitor liver effects closely as with any patient regardless of age.
Pregnancy Risk FactorC
Pregnancy ConsiderationsIn developmental studies, reduced body weight and increased skeletal variations were observed in rats. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential tumorigenicity of zileuton in animal studies, the manufacturer does not recommend breast-feeding.
Adverse Reactions

>10%: Central nervous system: Headache (23% to 25%)

1% to 10%:

Central nervous system: Pain (8%)

Dermatologic: Rash

Gastrointestinal: Dyspepsia (8%), nausea (6%), abdominal pain (5%), diarrhea, vomiting

Hematologic: Leukopenia (1% to 3%)

Hepatic: ALT increased (2% to 3%)

Neuromuscular & skeletal: Asthenia (4%), myalgia (3%)

Respiratory: Pharyngitis, sinusitis, upper respiratory tract infection

Miscellaneous: Hypersensitivity reactions

Frequency not defined:

Cardiovascular: Chest pain

Central nervous system: Dizziness, fever, insomnia, malaise, nervousness, somnolence

Dermatologic: Pruritus

Gastrointestinal: Constipation, flatulence

Genitourinary: Urinary tract infection, vaginitis

Neuromuscular & skeletal: Arthralgia, hypertonia, neck pain/rigidity

Ocular: Conjunctivitis

Miscellaneous: Lymphadenopathy

Postmarketing and/or case reports: Behavior/mood changes, hepatitis, hyperbilirubinemia, jaundice, liver failure, suicidality, suicide, urticaria

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2C9, 3A4; **Inhibits** CYP1A2 (moderate)

Drug Interactions

Propranolol: Zileuton may increase the serum concentration of Propranolol. *Risk C: Monitor therapy*

Theophylline: Zileuton may increase the serum concentration of Theophylline. *Risk D: Consider therapy modification*

Warfarin: Zileuton may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression; may increase risk of hepatic toxicity).

Food:

Zyflo CR™: Improved absorption when administered with food.

Zyflo®: Absorption not improved when taken with food.

Herb/Nutraceutical: St John's wort may decrease zileuton levels.

Monitoring ParametersEvaluate hepatic transaminases at initiation of, and during therapy. Monitor serum ALT before treatment begins, once-a-month for the first 3 months, every 2-3 months for the remainder of the first year, and periodically thereafter for patients receiving long-term zileuton therapy. If symptoms of liver dysfunction (right upper quadrant pain, nausea, fatigue, lethargy, pruritus, jaundice, or “flu-like” symptoms) develop or transaminase elevations >5 times ULN occur, discontinue therapy and follow transaminase levels until normal.

Nursing: Physical Assessment/MonitoringNot for use to relieve acute asthmatic attacks. Assess effectiveness and interactions of other medications patient may be taking. Monitor results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. For inpatient care, monitor vital signs and lung sounds prior to and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests

Patient EducationThis medication is not for an acute asthmatic attack; in acute attack, follow instructions of prescriber. Do not stop other asthma medication unless advised by prescriber. Do not discontinue, even if feeling better (this medication may help reduce incidence of acute attacks). Avoid alcohol and other medications unless approved by your prescriber. You may experience mild headache (mild analgesic may help); fatigue or dizziness (use caution when driving); or nausea or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent headache, chest pain, rapid heartbeat, or palpitations; skin rash or itching; unusual bleeding (eg, tarry stools, easy bruising, or blood in stool, urine, or mouth); skin rash or irritation; muscle weakness or tremors; redness, irritation, or infections of the eye; flu-like symptoms; itching; jaundice or dark urine; or worsening of asthmatic condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet:

Zyflo®: 600 mg [DSC]

Tablet, extended release:

Zyflo CR™: 600 mg

Generic AvailableNo

ManufacturerCritical Therapeutics, Inc

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Zyflo CR)

600 mg (120): $276.00

Tablets (Zyflo)

600 mg (120): $280.00

Mechanism of Action Specific 5-lipoxygenase inhibitor which inhibits leukotriene formation. Leukotrienes augment neutrophil and eosinophil migration, neutrophil and monocyte aggregation, leukocyte adhesion, increased capillary permeability, and smooth muscle contraction (which contribute to inflammation, edema, mucous secretion, and bronchoconstriction in the airway of the asthmatic.)
Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: 1.2 L/kg

Protein binding: 93%

Metabolism: Hepatic and gastrointestinal; zileuton and N-dehydroxylated metabolite can be metabolized by CYP1A2, 2C9, and 3A4

Bioavailability: Unknown

Half-life elimination: ~3 hours

Time to peak, serum: 1.7 hours

Excretion: Urine (~95% primarily as metabolites); feces (~2%)

Related Information

- Asthma

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, insomnia, or nervousness
Mental Health: Effects on Psychiatric TreatmentConcurrent use with propranolol may enhance beta-blocker activity

Zinc Chloride

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(zink KLOR ide)

Pharmacologic CategoryTrace Element

Use: Labeled IndicationsCofactor for replacement therapy to different enzymes; helps maintain normal growth rates, normal skin hydration, and senses of taste and smell

Dosing: Adults

Nutritional supplement: I.V.:

> *Stable with fluid loss from small bowel:* 12.2 mg zinc/L TPN or 17.1 mg zinc/kg (added to 1000 mL I.V. fluids) of stool or ileostomy output
>
> *Metabolically stable:* 2.5-4 mg/day, add 2 mg/day for acute catabolic states

Note: Clinical response may not occur for up to 6-8 weeks.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Nutritional supplement: I.V.: Added to I.V. solutions:

> Premature Infants <1500 g, up to 3 kg: 300 mcg/kg/day
>
> Infants (full term) and Children â¤5 years: 100 mcg/kg/day

Pregnancy Risk FactorC

Adverse Reactions<1%: Hypotension, indigestion, jaundice, leukopenia, nausea, neutropenia, pulmonary edema, vomiting

Drug Interactions

Quinolone Antibiotics: Zinc Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Zinc Salts. Zinc Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 1 mg/mL (10 mL, 50 mL)

Generic AvailableYes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Canadian Brand NamesZincofax®

Pharmacologic CategoryTopical Skin Product

Use: Labeled IndicationsProtective coating for mild skin irritations and abrasions; soothing and protective ointment to promote healing of chapped skin, diaper rash

Dosing: Adults

Protectant: Topical: Apply as required to affected areas several times daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Protectant:** Topical: Apply as required to affected areas several times daily

StorageAvoid prolonged storage at temperatures >30°C.

ContraindicationsHypersensitivity to zinc oxide or any component of the formulation

Adverse Reactions1% to 10%: Local: Skin sensitivity, irritation

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream:

Balmex®: 11.3% (60 g, 120 g, 480 g) [contains aloe and vitamin E]

Ointment, topical: 20% (30 g, 60 g, 454 g); 40% (120 g)

Desitin®: 40% (30 g, 60 g, 90 g, 120 g, 270 g, 480 g) [contains cod liver oil and lanolin]

Desitin® Creamy: 10% (60 g, 120 g)

Paste, topical:

Boudreaux's® Butt Paste: 16% (30 g, 60 g, 120 g, 480 g) [contains castor oil, boric acid, mineral oil, and Peruvian balsam]

Critic-Aid Skin Care®: 20% (71 g, 170 g)

Powder, topical (Ammens® Medicated Deodorant): 9.1% (187.5 g, 330 g) [original and shower fresh scent]

Generic AvailableYes: Ointment

Pricing: U.S. (www.drugstore.com)

Ointment (Zinc Oxide)

20% (30): $8.99

Medication Safety Issues

Sound-alike/look-alike issues:

$ZnSO_4$ is an error-prone abbreviation (mistaken as morphine sulfate)

Pronunciation(zink SUL fate)

U.S. Brand NamesOrazinc® [OTC]; Zincate®

Canadian Brand NamesAnuzinc; Rivasol

Pharmacologic CategoryTrace Element

Use: Labeled IndicationsZinc supplement (oral and parenteral); may improve wound healing in those who are deficient

Dosing: Adults

Recommended Daily Allowance (RDA): Oral: 15 mg elemental zinc/day

Zinc deficiency: Oral: 110-220 mg zinc sulfate (25-50 mg elemental zinc)/dose 3 times/day

Parenteral TPN: I.V.:

Acute metabolic states: 4.5-6 mg/day

Metabolically stable: 2.5-4 mg/day

Stable with fluid loss from the small bowel: 12.2 mg zinc/L of TPN solution, or an additional 17.1 mg zinc (added to 1000 mL I.V. fluids) per kg of stool or ileostomy output

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Recommended daily allowance (RDA): Oral:

Birth to 6 months: 3 mg elemental zinc/day

6-12 months: 5 mg elemental zinc/day

1-10 years: 10 mg elemental zinc/day

≥11 years: 15 mg elemental zinc/day

Zinc deficiency: Oral: Infants and Children: 0.5-1 mg elemental zinc/kg/day divided 1-3 times/day; somewhat larger quantities may be needed if there is impaired intestinal absorption or an excessive loss of zinc

Parenteral TPN: I.V.:

Infants (premature, birth weight <1500 g up to 3 kg): 300 mcg/kg/day

Infants (full term) and Children ≤5 years: 100 mcg/kg/day

Dietary ConsiderationsMay be taken with food if GI upset occurs.

StorageStore oral liquid (injectable used orally) in refrigerator.

Geriatric ConsiderationsMay be useful to promote wound healing in patients with pressure sores.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, restlessness

Gastrointestinal: Diarrhea, gastric ulcers, nausea, vomiting

Drug Interactions

Quinolone Antibiotics: Zinc Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Zinc Salts may decrease the absorption of Tetracycline Derivatives. Only a concern when both products are administered orally. **Exceptions:** Doxycycline. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Zinc Salts. Zinc Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Avoid foods high in calcium or phosphorus.

Patient EducationTake with food if GI upset occurs, but avoid foods high in calcium, phosphorus, or phytate. Do not exceed recommended dose. Notify prescriber if irritation persists or continues with ophthalmic use.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Orazinc®, Zincate®): 220 mg [elemental zinc 50 mg]

Injection, solution [preservative free]: 1 mg elemental zinc/mL (10 mL); 5 mg elemental zinc/mL (5 mL)

Tablet (Orazinc®): 110 mg [elemental zinc 25 mg]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Pronunciation(zi PRAS i done)

U.S. Brand NamesGeodon®

Canadian Brand NamesZeldox®

Pharmacologic CategoryAntipsychotic Agent, Atypical

Use: Labeled IndicationsTreatment of schizophrenia; treatment of acute manic or mixed episodes associated with bipolar disorder with or without psychosis; acute agitation in patients with schizophrenia

Use: Unlabeled/InvestigationalTourette's syndrome; psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Bipolar mania: Oral: Initial: 40 mg twice daily (with food)

Adjustment: May increase to 60 or 80 mg twice daily on second day of treatment; average dose 40-80 mg twice daily.

Schizophrenia: Oral: Initial: 20 mg twice daily (with food)

Adjustment: Increases (if indicated) should be made no more frequently than every 2 days; ordinarily patients should be observed for improvement over several weeks before adjusting the dose.

Maintenance: Range 20-100 mg twice daily; however, dosages >80 mg twice daily are generally not recommended.

Acute agitation (schizophrenia): I.M.: 10 mg every 2 hours **or** 20 mg every 4 hours (maximum: 40 mg/day). Oral therapy should replace I.M. administration as soon as possible.

Dosing: ElderlyNo dosage adjustment is recommended; consider initiating at a low end of the dosage range, with slower titration.
Dosing: Pediatric

Tourette's syndrome (unlabeled use): Children and adolescents: Oral: 5-40 mg/day

Dosing: Renal Impairment

Oral: No dosage adjustment is recommended

I.M.: Cyclodextrin, an excipient in the I.M. formulation, is cleared by renal filtration; use with caution.

Ziprasidone is not removed by hemodialysis.

Dosing: Hepatic ImpairmentNo adjustment necessary.
Administration: I.M.Injection: For I.M. administration only.
Administration: OralAdminister with food.
Storage

Capsule: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

Vials for injection: Prior to reconstitution, store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light. Following reconstitution, injection may be stored at room temperature up to 24 hours or up to 7 days if refrigerated. Protect from light.

ReconstitutionEach vial should be reconstituted with 1.2 mL SWI. Shake vigorously. Will form a pale, pink solution containing 20 mg/mL ziprasidone.
ContraindicationsHypersensitivity to ziprasidone or any component of the formulation; history (or current) prolonged QT; congenital long QT syndrome; recent myocardial infarction; history of arrhythmias; uncompensated heart failure; concurrent use of other QT_c-prolonging agents including amiodarone, arsenic trioxide, bretylium, chlorpromazine, cisapride, class Ia antiarrhythmics (quinidine, procainamide), dofetilide, dolasetron, droperidol, ibutilide, levomethadyl, mefloquine, mesoridazine, pentamidine, pimozide, probucol, some quinolone antibiotics (moxifloxacin), sotalol, tacrolimus, and thioridazine
Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control. There is limited documentation with ziprasidone and specific risk associated with this agent is not known.

- Neuroleptic malignant syndrome (NMS): Use may be associated with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- QT prolongation: May result in QT_c prolongation (dose related), which has been associated with the development of malignant ventricular arrhythmias (torsade de pointes) and sudden death. Observed prolongation was greater than with other atypical antipsychotic agents (risperidone, olanzapine, quetiapine), but less than with thioridazine. Avoid hypokalemia, hypomagnesemia. Use caution in patients with bradycardia. Discontinue in patients found to have persistent QT_c intervals >500 msec. Patients with symptoms of dizziness, palpitations, or syncope should receive further cardiac evaluation. Also see Contraindications.

- Rash: Use has been associated with a fairly high incidence of rash (5%); discontinue if alternative etiology is not identified.

- Sedation: Moderate to highly sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Suicidal ideation: The possibility of a suicide attempt is inherent in psychotic illness or bipolar disorder; use with caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects; not reported in premarketing trials of ziprasidone.

- Weight gain: Significant weight gain has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related behavioral disorders treated with atypical antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Ziprasidone is not approved for this indication.

- Hepatic impairment: Use with caution in patients with hepatic disease or impairment.

- Parkinson's disease: Use with caution in patients with Parkinson's disease.

- Prolactin-dependent tumors: Use caution in breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsExtrapyramidal syndrome symptoms occur less with this agent than phenothiazine and butyrophenone classes of antipsychotics.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly, acute changes in behavior are due to increases in drug dose or addition of a new drug to regimen, fluid electrolyte loss, infection, and changes in environment. Any changes in disease status and any organ system can result in behavior changes.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly, neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control. In light of significant risks and adverse effects in elderly population compared with limited data demonstrating efficacy in the treatment of dementia related psychosis, aggression, and agitation, an extensive risk:benefit analysis should be performed prior to use.

Since diabetes is prevalent in elderly, monitor closely when using this agent in this population.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDevelopmental toxicity demonstrated in animals. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit justifies risk to the fetus. Healthcare providers are encouraged to enroll women 18-45 years of age exposed to ziprasidone during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions**Note:** Although minor QT_c prolongation (mean: 10 msec at 160 mg/day) may occur more frequently (incidence not specified), clinically-relevant prolongation (>500 msec) was rare (0.06%) and less than placebo (0.23%).

>10%:

Central nervous system: Extrapyramidal symptoms (2% to 31%), somnolence (8% to 31%), headache (3% to 18%), dizziness (3% to 16%)

Gastrointestinal: Nausea (4% to 12%)

1% to 10%:

Cardiovascular: Chest pain (5%), postural hypotension (5%), hypertension (2% to 3%), bradycardia (2%), tachycardia (2%), vasodilation (1%), facial edema, orthostatic hypotension

Central nervous system: Akathisia (2% to 10%), anxiety (2% to 5%), insomnia (3%), agitation (2%), speech disorder (2%), personality disorder (2%), psychosis (1%), akinesia, amnesia, ataxia, chills, confusion, coordination abnormal, delirium, dystonia, fever, hostility, hypothermia, oculogyric crisis, vertigo

Dermatologic: Rash (4%), fungal dermatitis (2%)

Endocrine & metabolic: Dysmenorrhea (2%)

Gastrointestinal: Weight gain (10%), constipation (2% to 9%), dyspepsia (1% to 8%), diarrhea (3% to 5%), vomiting (3% to 5%), salivation increased (4%), xerostomia (1% to 5%), tongue edema (3%), abdominal pain (2%), anorexia (2%), dysphagia (2%), rectal hemorrhage (2%), tooth disorder (1%), buccoglossal syndrome

Genitourinary: Priapism (1%)

Local: Injection site pain (7% to 9%)

Neuromuscular & skeletal: Weakness (2% to 6%), hypoesthesia (2%), myalgia (2%), paresthesia (2%), back pain (1%), cogwheel rigidity (1%), hypertonia (1%), abnormal gait, choreoathetosis, dysarthria, dyskinesia, hyper-/hypokinesia, hypotonia, neuropathy, tremor, twitching

Ocular: Vision abnormal (3% to 6%), diplopia

Respiratory: Infection (8%), rhinitis (1% to 4%), cough (3%), pharyngitis (3%), dyspnea (2%)

Miscellaneous: Diaphoresis (2%), furunculosis (2%), flu-like syndrome (1%), photosensitivity reaction, withdrawal syndrome

<1%, postmarketing, and/or case reports: Abnormal ejaculation, abnormal gait, accidental fall, akinesia, albuminuria, alkaline phosphatase increased, allergic reaction, alopecia, amenorrhea, amnesia, anemia, angina, anorgasmia, atrial fibrillation, ataxia, AV block (first degree), basophilia, blepharitis, BUN increased, bundle branch block, cardiomegaly, cataract, cerebral infarction, chills, cholestatic jaundice, choreoathetosis, circumoral paresthesia, confusion, conjunctivitis, contact dermatitis, CPK increased, creatinine (serum) increased, dehydration, delirium, dry eyes, dysphagia, ecchymosis, eczema, enuresis, eosinophilia, epistaxis, exfoliative dermatitis, facial droop, facial palsy/paresis, fatty liver, fecal impaction, fever, flank pain, galactorrhea, GGT increased, gingival bleeding, gout, gynecomastia, hematemesis, hemoptysis, hematuria, hepatitis, hepatomegaly, hostility, hypercholesterolemia, hyper-/hypoglycemia, hyper-/hypokalemia, hyperlipemia, hyper-/hypothyroidism, hyperuricemia, hypoesthesia, hypocalcemia, hypokinesia, hypomagnesemia, hyponatremia, hypoproteinemia, hypotonia, jaundice, keratitis, keratoconjunctivitis, ketosis, lactation (female), laryngismus, LDH increased, leukocytosis, leukoplakia (mouth), lymphadenopathy, lymphedema, lymphocytosis, maculopapular rash, mania/hypomania, melena, menorrhagia, metrorrhagia, monocytosis, motor vehicle accident, myocarditis, myoclonus, myopathy, neuroleptic malignant syndrome, neuropathy, nocturia, nystagmus, ocular hemorrhage, phlebitis, polycythemia, oliguria, opisthotonos, peripheral edema, photophobia, pneumonia, polyuria, pulmonary embolism, QT_c prolongation >500 msec (0.06%), respiratory alkalosis, seizure (0.4%), sexual dysfunction (male and female), stroke, syncope (0.6%), tardive dyskinesia, tenosynovitis, thirst, thrombocytopenia, thrombocythemia, thrombophlebitis, thyroiditis, tinnitus, torsade de pointes, torticollis, transaminases increased, tremor, trismus, urinary incontinence, urinary retention, urticaria, uterine hemorrhage, vaginal hemorrhage, vertigo, vesiculobullous rash, visual field defect

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 3A4; **Inhibits** CYP2D6 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Administration with food increases serum levels twofold. Grapefruit juice may increase serum concentration of ziprasidone.

Herb/Nutraceutical: St John's wort may decrease serum levels of ziprasidone, due to a potential effect on CYP3A4. This has not been specifically studied. Avoid kava kava, chamomile (may increase CNS depression).

Test InteractionsIncreased cholesterol, triglycerides, eosinophils

Monitoring ParametersVital signs; serum potassium and magnesium; fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually); BMI, personal/family history of obesity, waist circumference; blood pressure; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms. Weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight. The value of routine ECG screening or monitoring has not been established.

Nursing: Physical Assessment/MonitoringAssess seizure risk (seizure history, ethanol use, head trauma, brain damage, or current therapy with medications that reduce seizure threshold) and cardiac status (bradycardia, QT prolongation) before starting therapy. Assess other medications patient may be taking for effectiveness and interactions (especially those dependent on cytochrome P450 metabolism). Monitor closely for therapeutic effectiveness and adverse reactions at beginning and at regular periods throughout therapy. Monitor weight prior to initiating therapy and at least monthly. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of initial weight. Assess knowledge/teach appropriate use of this medication, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsSerum potassium and magnesium; fasting lipid profile and fasting blood glucose, Hgb A_{1c} (prior to treatment, at 3 months, then annually).

Patient EducationUse this mediation exactly as directed; do not alter dosage or discontinue without consulting prescriber; may take 2-3 weeks to achieve desired results. Do not share this medication with anyone else. Avoid alcohol, caffeine, other prescription or OTC medication unless approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, you may experience increased blood sugars. Monitor blood sugars closely. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks hazardous tasks until response to drug is known); dry mouth, nausea, or GI upset (small frequent meals, good mouth care, sucking lozenges or chewing gum may help); postural hypotension (rise slowly when changing position from lying or sitting to standing or when climbing stairs); urinary retention (void before taking medication); or constipation (increased exercise, fluids, fruit, or fiber may help). Report immediately persistent CNS effects (eg, trembling, altered gait or balance, excessive sedation, seizures, unusual muscle or skeletal movements, excessive anxiety, hallucinations, nightmares, suicidal thoughts, or confusion); swelling or pain in breasts (male or female); altered menstrual pattern; sexual dysfunction; alteration in urinary pattern; vision changes; rash; respiratory difficulty; or chest pain or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 20 mg, 40 mg, 60 mg, 80 mg

Injection, powder for reconstitution, as mesylate: 20 mg

Generic AvailableNo

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Capsules (Geodon)

20 mg (60): $361.86

40 mg (60): $365.96

60 mg (60): $435.20

80 mg (60): $435.20

Mechanism of ActionZiprasidone is a benzylisothiazolylpiperazine antipsychotic. The exact mechanism of action is unknown. However, *in vitro* radioligand studies show that ziprasidone has high affinity for D_2, D_3, 5-HT_{2A}, 5-HT_{1A}, 5-HT_{2C}, 5-HT_{1D}, and alpha$_1$-adrenergic; moderate affinity for histamine H_1 receptors; and no appreciable affinity for alpha$_2$-adrenergic receptors, beta-adrenergic, 5-HT_3, 5-HT_4, cholinergic, mu, sigma, or benzodiazepine receptors. Ziprasidone functions as an antagonist at the D_2, 5-HT_{2A}, and 5-HT_{1D} receptors and as an agonist at the 5-HT_{1A} receptor. Ziprasidone moderately inhibits the reuptake of serotonin and norepinephrine.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: 1.5 L/kg

Protein binding: 99%, primarily to albumin and alpha$_1$-acid glycoprotein

Metabolism: Extensively hepatic, primarily via aldehyde oxidase; less than $^1/_3$ of total metabolism via CYP3A4 and CYP1A2 (minor)

Bioavailability: Oral (with food): 60% (up to twofold increase with food); I.M.: 100%

Half-life elimination: Oral: 7 hours; I.M.: 2-5 hours

Time to peak: Oral: 6-8 hours; I.M.: ≤60 minutes

Excretion: Feces (66%) and urine (20%) as metabolites; little as unchanged drug (1% urine, 4% feces)

Clearance: 7.5 mL/minute/kg

- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsThe increased potential to prolong QT_c, as compared to other available antipsychotic agents, should be considered in the evaluation of available alternatives.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), orthostatic hypotension, tongue edema, dysphagia, and tooth disorder.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsZiprasidone is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Child/Adolescent Considerations Twenty-eight children 7-17 years of age with Tourette's syndrome and chronic tic disorder were randomly assigned to ziprasidone or placebo for 56 days. Ziprasidone was initiated at 5 mg/day and titrated to a maximum of 40 mg/day (Sallee, 2000).

An open-label trial of ziprasidone in 10 children and adolescents with pervasive developmental disorder showed 50% of patients as "much improved" at the end of the study (McDougle, 2002). Study duration averaged 14 weeks (range: 6-30 weeks) with an initial ziprasidone dosage of 20 mg twice daily, titrated up to an average maintenance of 30 mg twice daily (range: 20-120 mg/day). Sedation was the most common adverse reaction and no cardiovascular events (including QT prolongation) were noted.

McDougle CJ, Kem DL, and Posey DJ, “Case Series: Use of Ziprasidone for Maladaptive Symptoms in Youths With Autism,” *J Am Acad Child Adolesc Psychiatry*, 2002, 41(8):921-7.

Sallee FR, Kurlan R, Goetz CG, et al, “Ziprasidone Treatment of Children and Adolescents With Tourette's Syndrome: A Pilot Study,” *J Am Acad Child Adolesc Psychiatry*, 2000, 39(3):292-9.

Mental Health Comment Ziprasidone is an antipsychotic agent of a class often referred to as atypical. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration. Clinically, the dose range for ziprasidone appears to be higher than the approved range (40-160 mg/day); minimum effective dose for most patients is 120 mg/day. Therefore, appropriate dosing with this compound is important. It is also important that this medication be taken with a 500 calorie meal as the bioavailability is increased 100% in the presence of food.

The short-acting I.M. formulation appears to be as efficacious as other available agents for the management of acute agitation; however, comparative trials have not been conducted.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Atypical antipsychotics appear less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol).

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Zometa® may be confused with Zofran®, Zoladex®

Pronunciation(zoe le DRON ik AS id)

U.S. Brand NamesReclast®; Zometa®

Canadian Brand NamesAclasta®; Zometa®

Pharmacologic CategoryAntidote; Bisphosphonate Derivative

Use: Labeled IndicationsTreatment of hypercalcemia of malignancy (albumin-corrected serum calcium ≥12 mg/dL), multiple myeloma, bone metastases of solid tumors, Paget's disease of bone; osteoporosis (to reduce the incidence of fractures in postmenopausal women with osteoporosis or to reduce the incidence of new clinical fractures in patients with low-trauma hip fracture)

Use: Unlabeled/InvestigationalPrevention of bone loss associated with aromatase inhibitor therapy in postmenopausal women with breast cancer; prevention of bone loss associated with androgen deprivation therapy in prostate cancer

Dosing: Adults**Note:** Patients treated for multiple myeloma, osteoporosis, and Paget's disease should receive a daily calcium supplement and multivitamin containing vitamin D (if dietary intake is inadequate)

Hypercalcemia of malignancy (albumin-corrected serum calcium ≥12 mg/dL): I.V. (Zometa®): 4 mg (maximum) given as a single dose. Wait at least 7 days before considering retreatment. Dosage adjustment may be needed in patients with decreased renal function following treatment.

Multiple myeloma or metastatic bone lesions from solid tumors: I.V. (Zometa®): 4 mg every 3-4 weeks

Osteoporosis (Reclast®, Aclasta® [CAN]): 5 mg infused over at least 15 minutes every 12 months

Paget's disease (Reclast®, Aclasta® [CAN]): 5 mg infused over at least 15 minutes. **Note:** Data concerning retreatment is not available.

Prevention of aromatase inhibitor-induced bone loss in breast cancer (unlabeled use): 4 mg every 6 months

Prevention of androgen deprivation-induced bone loss in nonmetastatic prostate cancer (unlabeled use): 4 mg every 3-12 months

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Reclast®: Cl_{cr} <35 mL/minute: Not recommended

Zometa®: Multiple myeloma and bone metastases (at treatment initiation):

Cl_{cr} >60 mL/minute: 4 mg

Cl_{cr} 50-60 mL/minute: 3.5 mg

Cl_{cr} 40-49 mL/minute: 3.3 mg

Cl_{cr} 30-39 mL/minute: 3 mg

Cl_{cr} <30 mL/minute: Not recommended

Zometa®: Hypercalcemia of malignancy (at treatment initiation):

Mild-to-moderate impairment: No adjustment necessary

Severe impairment (serum creatinine >4.5 mg/dL): Evaluate risk versus benefit

Aclasta® [CAN]:

Cl_{cr} ≥30 mL/minute: No adjustment recommended

Cl_{cr} <30 mL/minute: Use is not recommended

Renal toxicity (during treatment):

Hypercalcemia of malignancy: Evidence of renal deterioration: Evaluate risk versus benefit.

Multiple myeloma and bone metastases: Evidence of renal deterioration: Withhold dose until renal function returns to within 10% of baseline: renal deterioration defined as follows:

Normal baseline creatinine: Increase of 0.5 mg/dL

Abnormal baseline creatinine: Increase of 1 mg/dL

Reinitiate dose at the same dose administered prior to treatment interruption.

Dosing: Hepatic ImpairmentSpecific guidelines are not available.

Calculations

- Calcium Correction
- Creatinine Clearance: Adults

Administration: I.V.Infuse over 15-30 minutes; do not infuse over <15 minutes.

Reclast®: If refrigerated, allow to reach room temperature prior to administration. Acetaminophen or ibuprofen after administration may reduce the incidence of acute reaction (eg, arthralgia, fever, flu-like symptoms, myalgia).

Administration: I.V. DetailInfuse in a line separate from other medications. Patients should be appropriately hydrated prior to treatment.

Zometa®: pH: 2

Reclast®, Aclasta® [CAN]: pH 6-7 (infusion)

Dietary Considerations

Multiple myeloma or metastatic bone lesions from solid tumors: Take daily calcium supplement (500 mg) and daily multivitamin (with 400 int. units vitamin D).

Osteoporosis: Ensure adequate calcium and vitamin D supplementation. Postmenopausal women generally require calcium 1200 mg/day and vitamin D 800-1000 int. units/day.

Paget's disease: Take calcium 1500 mg/day and vitamin D 800 units/day, particularly during the first 2 weeks after administration.

Storage

Aclasta® [CAN]: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Reclast®: Store at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). After opening, stable for 24 hours at 2°C to 8°C (36°F to 46°F).

Zometa®: Store vials at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Solutions for infusion may be stored for 24 hours at 15°C to 30°C (59°F to 86°F). Infusion of solution must be completed within 24 hours.

ReconstitutionZometa®: Dilute solution for injection in 100 mL NS or D_5W prior to administration.

Compatibility**Incompatible** with calcium-containing solutions (eg, LR).

ContraindicationsHypersensitivity to zoledronic acid, other bisphosphonates, or any component of the formulation; hypocalcemia (Reclast®)

Note: In Canada, Aclasta® is also contraindicated with uncorrected hypocalcemia at the time of infusion and in pregnancy and breast-feeding.

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

- Renal deterioration: Single and multiple infusions have been associated with renal deterioration, resulting in renal failure and dialysis; has occurred in patients with normal and impaired renal function.

Disease-related concerns:

- Aspirin-sensitive asthma: Use with caution in patients with aspirin-sensitive asthma; may cause bronchoconstriction.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hypocalcemia: May cause hypocalcemia in patients with Paget’s disease, in whom the pretreatment rate of bone turnover may be greatly elevated. Hypocalcemia must be corrected before initiation of therapy in patients with Paget's disease and osteoporosis. Ensure adequate calcium and vitamin D intake during therapy. Use caution in patients with disturbances of calcium and mineral metabolism (eg, hypoparathyroidism, thyroid surgery, malabsorption syndromes).

- Renal impairment: Use with caution in renal impairment. Dehydration and concurrent use of other nephrotoxic drugs may increase the risk for renal impairment. Adequate hydration is required during treatment (urine output ~2 L/day); avoid overhydration, especially in patients with heart failure.

  Reclast®: Use is not recommended in patients with severe renal impairment (Cl_{cr} <35 mL/minute).

  Zometa®: Dosage adjustment required with renal impairment. Use is not recommended in patients with severe renal impairment (serum creatinine >3 mg/dL) and bone metastases (limited data); use in patients with hypercalcemia of malignancy and severe renal impairment should only be done if the benefits outweigh the risks. In cancer patients, renal toxicity has been reported with doses >4 mg or infusions administered over 15 minutes. Risk factors for renal deterioration include pre-existing renal insufficiency and repeated doses and other bisphosphonates therapy. Dehydration and the use of other nephrotoxic drugs which may contribute to renal deterioration should be identified and managed. Diuretics should not be used before correcting hypovolemia. Renal function should be assessed prior to treatment; if decreased after treatment, additional treatments should be withheld until renal function returns to within 10% of baseline.

  Aclasta® [CAN; not available in U.S.]: Use is not recommended in patients with severe renal impairment (Cl_{cr} <30 mL/minute).

Special populations:

- Elderly: Use with caution in the elderly due to the possibility for decreased renal function; monitor.

- Pediatrics: Not approved for use in children.

- Women of childbearing age: Advise women of childbearing age against becoming pregnant.

Dosage form specific issues:

- Aclasta® [CAN], Reclast®: When used in the treatment of Paget's disease, significant renal deterioration has not been observed with the usual 5 mg dose administered over at least 15 minutes.

Geriatric ConsiderationsThis drug requires adequate hydration and adjustments for creatinine clearance for its use. Elderly are often volume depleted secondary to drugs and a blunted thirst reflex. See disease related concerns in Dosage: Renal Impairment.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies resulted in embryotoxicity and losses. Zoledronic acid should not be used during pregnancy; may cause fetal harm if administered to a pregnant woman. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if administered during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsBecause it binds to bone long term, zoledronic acid use is not recommended in nursing women.

Adverse Reactions**Note:** An acute reaction (eg, arthralgia, fever, flu-like symptoms, myalgia) may occur within the first 3 days following infusion in up to 44% of patients; usually resolves within 3-4 days of onset, although may take up to 14 days to resolve. The incidence may be decreased with acetaminophen (prior to infusion and for 72 hours postinfusion).

Zometa®:

>10%:

Cardiovascular: Leg edema (5% to 21%), hypotension (11%)

Central nervous system: Fatigue (39%), fever (32% to 44%), headache (5% to 19%), dizziness (18%), insomnia (15% to 16%), anxiety (11% to 14%), depression (14%), agitation (13%), confusion (7% to 13%), hypoesthesia (12%)

Dermatologic: Alopecia (12%), dermatitis (11%)

Endocrine & metabolic: Dehydration (5% to 14%), hypophosphatemia (12% to 13%), hypokalemia (12%), hypomagnesemia (11%)

Gastrointestinal: Nausea (29% to 46%), constipation (27% to 31%), vomiting (14% to 32%), diarrhea (17% to 24%), anorexia (9% to 22%), abdominal pain (14% to 16%), weight loss (16%), appetite decreased (13%)

Genitourinary: Urinary tract infection (12% to 14%)

Hematologic: Anemia (22% to 33%), neutropenia (12%)

Neuromuscular & skeletal: Bone pain (55%), weakness (5% to 24%), myalgia (23%), arthralgia (5% to 21%), back pain (15%), paresthesia (15%), limb pain (14%), skeletal pain (12%), rigors (11%)

Renal: Renal deterioration (8% to 17%; up to 40% in patients with abnormal baseline creatinine)

Respiratory: Dyspnea (22% to 27%), cough (12% to 22%)

Miscellaneous: Cancer progression (16%), moniliasis (12%)

1% to 10%:

Cardiovascular: Chest pain (5% to 10%)

Central nervous system: Fever (9% to 18%), headache (4% to 12%)

Neuromuscular & skeletal: Arthralgia (9% to 24%), myalgia (5% to 12%), limb pain (6% to 11%)

Miscellaneous: Flu-like syndrome (1% to 11%)

1% to 10%:

Cardiovascular: Peripheral edema (3% to 6%), atrial fibrillation (2% to 3%)

Central nervous system: Dizziness (2% to 9%), fatigue (2% to 8%), chills (2% to 5%), lethargy (5%), pain (2% to 5%), malaise (1% to 2%), hyperthermia (≤2%)

Dermatologic: Rash (3%)

Endocrine & metabolic: Hypocalcemia (≤3%)

Gastrointestinal: Nausea (5% to 9%), constipation (6%), diarrhea (5% to 6%), dyspepsia (2% to 5%), vomiting (2% to 5%), abdominal pain (1% to 5%), abdominal distension (2%), anorexia (1% to 2%)

Neuromuscular & skeletal: Bone pain (3% to 9%), rigors (8%), shoulder pain (≤7%), weakness (2% to 5%), back pain (4%), muscle spasm (2% to 4%), musculoskeletal pain (≤3%), muscle stiffness (2%), paresthesia (2%)

Renal: Serum creatinine increased (2%)

Respiratory: Dyspnea (5%)

Zometa® and/or Reclast®: <1%, postmarketing, and/or case reports: Allergic reaction, anaphylactic reaction/shock, angioneurotic edema, arrhythmia, blurred vision, bradycardia, bronchoconstriction, conjunctivitis, diaphoresis, episcleritis; flu-like syndrome (fever, chills, flushing, bone pain, arthralgia, myalgia); hematuria, hyperesthesia, hyperkalemia, hypernatremia, hypersensitivity, hypertension; injection site reaction (eg, itching, pain, redness); iritis, joint and/or muscle pain (sometimes severe and/or incapacitating), muscle cramps, osteonecrosis (primarily of the jaws), proteinuria, pruritus, rash, renal failure, renal impairment, taste perversion, tremor, urticaria, uveitis, weight gain, xerostomia

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Thalidomide: May enhance the adverse/toxic effect of Zoledronic Acid. *Risk C: Monitor therapy*

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersPrior to initiation of therapy, dental exam and preventative dentistry for patients at risk for osteonecrosis

Aclasta® [CAN]: Serum creatinine, calcium and vitamin D levels

Reclast®: Alkaline phosphatase, serum creatinine (prior to each dose and periodically thereafter in high risk patients), calcium and mineral (phosphorus and magnesium) levels

Zometa®: Serum creatinine prior to each dose; serum electrolytes, phosphate, magnesium, and hemoglobin/hematocrit should be evaluated regularly. Monitor serum calcium to assess response and avoid overtreatment.

Nursing: Physical Assessment/MonitoringRenal function and risk factors for osteonecrosis should be evaluated prior to beginning therapy. Patients at risk for osteonecrosis (eg, chemotherapy, corticosteroids, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, other nephrotoxic agents). Evaluate results of laboratory tests and patient response on a regular basis during therapy. Teach patient possible side effects/appropriate interventions (eg, need for adequate hydration) and adverse symptoms to report.

Monitoring: Lab Tests

Aclasta® [CAN]: Serum creatinine, calcium and vitamin D levels

Reclast®: Alkaline phosphatase, serum creatinine (prior to each dose and periodically thereafter in high risk patients), calcium and mineral (phosphorus and magnesium) levels

Zometa®: Serum creatinine prior to each dose; serum electrolytes, phosphate, magnesium, and hemoglobin/hematocrit should be evaluated regularly. Monitor serum calcium to assess response and avoid overtreatment.

Patient EducationThis medication is only administered by infusion or injection; report burning, redness, or pain at infusion/injection site immediately. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). Certain dental procedures should be avoided if possible while you are taking this medication; consult prescriber. You may experience a brief reaction (3-14 days), including fever, flu-like symptoms, nausea, vomiting, or loss of appetite (small, frequent meals, good mouth care, sucking lozenges, or chewing gum may help); headache, dizziness, insomnia, confusion (use caution when driving or engaging in tasks that require alertness until response to drug is known); or muscle, joint, or recurrent bone pain (consult prescriber for appropriate analgesic). Report difficulty breathing; chest pain; persistent CNS changes (fatigue, depression, insomnia, agitation, dizziness); unusual muscle twitching or spasms; swollen legs; severe diarrhea/constipation; acute bone, joint, or muscle pain; changes in urinary pattern; skin rash; burning or itching on urination; or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not get pregnant during therapy. Consult prescriber for instructions on appropriate contraceptive measures. This drug may cause fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Infusion, solution [premixed]:

Aclasta® [CAN]: 5 mg (100 mL) [not available in U.S.]

Reclast®: 5 mg (100 mL)

Injection, solution:

Zometa®: 4 mg/5 mL (5 mL) [as monohydrate 4.264 mg]

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Concentrate (Zometa)

4 mg/5 mL (5): $984.99

Solution (Reclast)

5 mg/100 mL (30): $353.49

Mechanism of ActionA bisphosphonate which inhibits bone resorption via actions on osteoclasts or on osteoclast precursors; inhibits osteoclastic activity and skeletal calcium release induced by tumors. Decreases serum calcium and phosphorus, and increases their elimination. In osteoporosis, zoledronic acid inhibits osteoclast-mediated resorption, therefore reducing bone turnover.

Pharmacodynamics/Kinetics

Distribution: Binds to bone

Protein binding: 28% to 53%

Half-life elimination: Triphasic; Terminal: 146 hours

Excretion: Urine (39% ± 16% as unchanged drug) within 24 hours; feces (<3%)

Dental Health Professional ConsiderationsNovartis Pharmaceuticals Corporation has notified dental health professionals of the risk of **osteonecrosis of the jaw (ONJ)** and the use of the intravenous bisphosphonates, pamidronate (Zometa®) and zoledronic acid (Aredia®): *"Dear Dental Health Professional" Letter Issued for Intravenous Bisphosphonates, Pamidronate and Zoledronic Acid, Regarding the Risk of Osteonecrosis of the Jaw (ONJ) in Cancer Patients* – May 2005.

Often observed in patients receiving chemotherapy and corticosteroids, reports of ONJ (the majority being associated with dental procedures) have been documented in cancer patients. Dental exams and preventative dentistry should be performed prior to placing patients with risk factors (chemotherapy, corticosteroids, poor oral hygiene) on intravenous bisphosphonate therapy. Additionally, invasive dental procedures should be avoided during therapy; patients developing ONJ while on bisphosphonate therapy should not have invasive dental procedures because the condition may be exacerbated. It has not been determined whether the discontinuation of bisphosphonate therapy in patients requiring dental surgery decreases the risk of ONJ. The treating healthcare professional is encouraged to assess the benefits and risks.

Bisphosphonates are widely used in the management of metastatic bone disease to treat hypercalcemia associated with malignancies and to treat osteoporosis. It is suggested that because of the trend in the use of chronic bisphosphonate therapy, the observation of an associated risk of osteonecrosis of the jaw should alert practitioners to monitor for this previously unrecognized potential complication.

Additional information is available at http://www.fda.gov/medwatch/SAFETY/2005/safety05.htm#zometa2, or by contacting Novartis Oncology Medical Services at 1-888-669-6682.

Zoledronic acid (Reclast®) when used to prevent osteoporosis in postmenopause has not been shown to increase the risk of developing ONJ when given as a 15-minute I.V. infusion once annually.

Estimates of Percent Incidence of ONJ in Treated Cancer Patients

Two reports have attempted to assess the percent of cancer patients developing ONJ after bisphosphonate treatment. Maerevoet et al, reported that among 194 patients treated with Zometa® every 3-4 weeks, nine developed ONJ. Before receiving Zometa®, six had received Aredia® 90 mg every 3-4 weeks. The median duration of treatment with Aredia® was 39 months and for Zometa® 18 months. The incidence of ONJ in these patients was calculated to be 4.6%. Durie et al, described the results of a survey by the International Myeloma Foundation in 2004 to assess the risk factors of ONJ. Out of 1203 respondents, 904 had myeloma and 299 breast cancer. Of the myeloma patients, 62 developed ONJ and 54 had suspicious findings. Of the breast cancer patients, 13 had ONJ and 23 had suspicious findings. The total number of cases of either ONJ or suspicious findings was 152. ONJ developed in 10% of 211 patients receiving Zometa® compared to 4% of 413 receiving Aredia®. The mean time to onset of ONJ among patients taking Zometa® was 18 months; the mean time to onset after Aredia® was 6 years. It should be noted that an early report by authors from Novartis Pharmaceuticals Corporation (Tarassoff, 2003) stressed that Aredia® and Zometa® had been used in 2.5 million patients world wide and reports of ONJ during their extensive use had been rare. In addition, these authors stated that review of the reported cases revealed multiple risk factors for avascular necrosis. McMahon et al, followed up with a report that, along with other factors, bisphosphonates are additional stressors of bone health that can tip the balance to osteonecrosis. They suggested that the prevention of ONJ should be stressed such as the elimination of chronic dental infections prior to chemotherapy and bisphosphonate use in cancer patients.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis, dysphagia, stomatitis, and sore throat.

Osteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia, anxiety, agitation, depression, and dizziness are common; may rarely cause confusion

Mental Health: Effects on Psychiatric TreatmentBisphosphonates have been associated with renal toxicity manifested as deterioration of renal function and potential renal failure. Use caution in patients receiving lithium. GI side effects are common; concomitant use with SSRIs may produce additive effects. May cause neutropenia; use caution with clozapine and carbamazepine.

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Zolmitriptan may be confused with SUMAtriptan

Pronunciation(zohl mi TRIP tan)

U.S. Brand NamesZomig-ZMT®; Zomig®

Canadian Brand NamesZomig®; Zomig® Nasal Spray; Zomig® Rapimelt

Pharmacologic CategoryAntimigraine Agent; Serotonin 5-HT$_{1B, 1D}$ Receptor Agonist

Use: Labeled IndicationsAcute treatment of migraine with or without aura

Dosing: Adults

Migraine headache:

Oral:

Tablet: Initial: ≤2.5 mg at the onset of migraine headache; may break 2.5 mg tablet in half

Orally-disintegrating tablet: Initial: 2.5 mg at the onset of migraine headache

Nasal spray: Initial: 1 spray (5 mg) at the onset of migraine headache

Note: Use the lowest possible dose to minimize adverse events. If the headache returns, the dose may be repeated after 2 hours; do not exceed 10 mg within a 24-hour period. Controlled trials have not established the effectiveness of a second dose if the initial one was ineffective.

Dosing: ElderlyRefer to adult dosing. No dosage adjustment needed, but elderly patients are more likely to have underlying cardiovascular disease and should have careful evaluation of cardiovascular system before prescribing.

Dosing: Renal ImpairmentNo dosage adjustment recommended. There is a 25% reduction in zolmitriptan's clearance in patients with severe renal impairment (Cl$_{cr}$ 5-25 mL/minute).

Dosing: Hepatic ImpairmentAdminister with caution in patients with liver disease, generally using doses <2.5 mg (doses <5 mg can only be achieved using oral tablets). Patients with moderate-to-severe hepatic impairment may have decreased clearance of zolmitriptan, and significant elevation in blood pressure was observed in some patients.

Administration: OralAdminister as soon as migraine headache starts. Tablets may be broken. Orally-disintegrating tablets: Must be taken whole; do not break, crush or chew. Place on tongue and allow to dissolve. Administration with liquid is not required

Administration: OtherNasal spray: Administer as soon as migraine headache starts. Blow nose gently prior to use. After removing protective cap, instill device into nostril. Block opposite nostril; breathe in gently through nose while pressing plunger of spray device. One dose (5 mg) is equal to 1 spray in 1 nostril.

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light and moisture.

ContraindicationsHypersensitivity to zolmitriptan or any component of the formulation; ischemic heart disease or vasospastic coronary artery disease, including Prinzmetal's angina; signs or symptoms of ischemic heart disease; uncontrolled hypertension; symptomatic Wolff-Parkinson-White syndrome or arrhythmias associated with other cardiac accessory conduction pathway disorders; use with ergotamine derivatives (within 24 hours of); use within 24 hours of another 5-HT$_1$ agonist; concurrent administration or within 2 weeks of discontinuing an MAO inhibitor; management of hemiplegic or basilar migraine

Nasal spray: Additional contraindications with nasal spray: Cerebrovascular syndromes (eg, stroke, TIA); peripheral vascular disease (including ischemic bowel disease)

Allergy Considerations

- Serotonin 5-HT$_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT$_1$ agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.
- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT$_1$ agonist administration; nasal spray contraindicated in patients with cerebrovascular syndromes.

- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.

- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT$_1$ agonist.

- Visual effects: Rarely, partial vision loss and blindness (transient and permanent) have been reported with 5-HT$_1$ agonists.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation “is satisfactory,” first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.

- Hepatic impairment: Use with caution in patients with hepatic impairment. Drug clearance may be reduced leading to increased plasma concentrations; dosage reduction of the oral product is recommended.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (eg, SSRIs/SNRIs or triptans) or agents which reduce zolmitriptan's metabolism. Concurrent use of serotonin precursors is not recommended (doses <5 mg can only be achieved using oral tablets).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age (oral) and <12 years of age (nasal).

Dosage form specific issues:

- Phenylalanine: Zomig-ZMT™ tablets contain phenylalanine.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered.

Geriatric ConsiderationsNo dosage adjustment needed, but elderly patients are more likely to have underlying cardiovascular disease and should have careful evaluation of the cardiovascular system before prescribing.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using zolmitriptan in pregnant women. Use only if potential benefit to the mother outweighs the potential risk to the fetus. In animal studies, administration was associated with embryolethality, fetal abnormalities, and pup mortality.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPercentages noted from oral preparations.

1% to 10%:

Cardiovascular: Chest pain (2% to 4%), palpitation (up to 2%)

Central nervous system: Dizziness (6% to 10%), somnolence (5% to 8%), pain (2% to 3%), vertigo (≤2%)

Gastrointestinal: Nausea (4% to 9%), xerostomia (3% to 5%), dyspepsia (1% to 3%), dysphagia (≤2%)

Neuromuscular & skeletal: Paresthesia (5% to 9%), weakness (3% to 9%), warm/cold sensation (5% to 7%), hypoesthesia (1% to 2%), myalgia (1% to 2%), myasthenia (up to 2%)

Miscellaneous: Neck/throat/jaw pain (4% to 10%), diaphoresis (up to 3%), allergic reaction (up to 1%)

<1%: Agitation, akathisia, alkaline phosphatase increased, amnesia, anorexia, anxiety, apathy, apnea, appetite increased, arrhythmia, arthritis, ataxia, back pain, bradycardia, bronchitis, bronchospasm, bruising, cerebral ischemia, chills, constipation, cyanosis, cystitis, depression, diplopia, dry eyes, dysmenorrhea, dystonia, ear pain, edema, emotional lability, eosinophilia, epistaxis, esophagitis, euphoria, extrasystole, eye pain, facial edema, fever, gastritis, gastroenteritis, hallucinations, hematemesis, hematuria, hiccups, hyperacusis, hyperesthesia, hyperglycemia, hyperkinesias, hypertension, hypertensive crisis, hyper-/hypotonia, insomnia, irritability, lacrimation, laryngitis, leg cramps, leukopenia, liver function abnormality, malaise, melena, miscarriage, pancreatitis, parosmia, photosensitivity, polyuria, postural hypotension, pruritus, QT prolongation, rash, syncope, tachycardia, tenosynovitis, tetany, thirst, thrombocytopenia, thrombophlebitis, tinnitus, tongue edema, twitching, ulcer, urinary frequency, urinary urgency, urticaria, voice alteration, yawning

Postmarketing and/or case reports: Anaphylactoid reaction, anaphylaxis, angina pectoris, coronary artery vasospasm, gastrointestinal infarction/necrosis, headache, ischemic colitis, MI, myocardial ischemia, serotonin syndrome, splenic infarction

Events related to other serotonin 5-HT$_{1D}$ receptor agonists: Cerebral hemorrhage, stroke, subarachnoid hemorrhage, peripheral vascular ischemia, ventricular fibrillation

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor)

Drug Interactions

Cimetidine: May increase the serum concentration of Zolmitriptan. *Risk C: Monitor therapy*

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

MAO Inhibitors: May decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Limit use (may have additive CNS toxicity).

Nursing: Physical Assessment/MonitoringFor use only with a clear diagnosis of migraine headaches. Use caution in presence of cardiovascular risk factors and hepatic impairment. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, ergot-containing drugs). Assess effectiveness and adverse response (eg, chest pain, nausea, dizziness, paresthesia, myalgia, pain). Teach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis drug is to be used to reduce your migraine, not to prevent or reduce the number of attacks. Follow exact instructions for use. Remove orally-disintegrating tablet from blister package just before using, place on tongue, and allow to dissolve. Do not crush, break, or chew. Regular tablet may be broken in half for use. Do not remove protective cap from nasal spray until ready to use. Do not take within 24 hours of any other migraine medication without first consulting prescriber. If first dose brings relief, second dose may be taken anytime after 2 hours if migraine returns. If you have no relief with first dose, do not take a second dose without consulting prescriber. Do not exceed 10 mg in 24 hours. May cause dizziness or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth (frequent mouth care and sucking on lozenges may help). Report immediately any chest pain, heart throbbing, or tightness in throat; swelling of eyelids, face, or lips; skin rash or hives; easy bruising; blood in urine, stool, or vomitus; pain or itching with urination; or pain, warmth, or numbness in extremities. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intranasal [spray]:

Zomig®: 5 mg/0.1 mL (0.1 mL)

Tablet:

Zomig®: 2.5 mg, 5 mg

Tablet, orally disintegrating:

Zomig-ZMT®: 2.5 mg [contains phenylalanine 2.81 mg/tablet; orange flavor]; 5 mg [contains phenylalanine 5.62 mg/tablet; orange flavor]

Generic AvailableNo

ManufacturerAstraZeneca Pharmaceuticals LP

Pricing: U.S. (www.drugstore.com)

Solution (Zomig)

5 mg (6): $181.05

Tablet, orally-disintegrating (Zomig ZMT)

2.5 mg (6): $123.99

5 mg (3): $72.08

Tablets (Zomig)

2.5 mg (6): $125.99

5 mg (3): $70.99

Mechanism of ActionSelective agonist for serotonin (5-HT_{1B} and 5-HT_{1D} receptors) in cranial arteries to cause vasoconstriction and reduce sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine

Pharmacodynamics/Kinetics

Onset of action: 0.5-1 hour

Absorption: Well absorbed

Distribution: V_d: 7 L/kg

Protein binding: 25%

Metabolism: Converted to an active N-desmethyl metabolite (2-6 times more potent than zolmitriptan)

Bioavailability: 40%

Half-life elimination: 2.8-3.7 hours

Time to peak, serum: Tablet: 1.5 hours; Orally-disintegrating tablet and nasal spray: 3 hours

Excretion: Urine (~60% to 65% total dose); feces (30% to 40%)

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Pharmacotherapy PearlsNot recommended if the patient has risk factors for heart disease (high blood pressure, high cholesterol, obesity, diabetes, smoking, strong family history of heart disease, postmenopausal woman, or a male >40 years of age).

This agent is intended to relieve migraine, but not to prevent or reduce the number of attacks. Use only to treat an actual migraine attack.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common, may cause drowsiness

Mental Health: Effects on Psychiatric TreatmentContraindicated with other serotonin agonists (SSRIs) and MAO inhibitors

Cardiovascular ConsiderationsCoronary vasospasm has been associated with $5\text{-HT}_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic of vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.

Anesthesia and Critical Care Concerns/Other ConsiderationsZolmitriptan should not be used in patients with a history of vasospastic disease, Prinzmetal's angina, or any critical vascular disease.

Index Terms311C90

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ambien® may be confused with Ambi 10®

Pronunciation(zole PI dem)
U.S. Brand NamesAmbien CR®; Ambien®; Zolpimist®
Pharmacologic CategoryHypnotic, Nonbenzodiazepine
Use: Labeled Indications

Ambien®: Short-term treatment of insomnia (with difficulty of sleep onset)

Ambien CR®: Treatment of insomnia (with difficulty of sleep onset and/or sleep maintenance)

Use: DentalHas not been established
Dosing: Adults**Insomnia:** Oral:

Ambien®: 10 mg immediately before bedtime; maximum dose: 10 mg

Ambien CR®: 12.5 mg immediately before bedtime

Dosing: Elderly

Ambien®: 5 mg immediately before bedtime

Ambien CR®: 6.25 mg immediately before bedtime

Dosing: Renal ImpairmentDose adjustment not required; monitor closely.

Not dialyzable

Dosing: Hepatic Impairment

Ambien®: 5 mg

Ambien CR®: 6.25 mg

Administration: OralIngest immediately before bedtime due to rapid onset of action. Ambien CR® tablets should be swallowed whole; do not divide, crush, or chew.
Dietary ConsiderationsFor faster sleep onset, do not administer with (or immediately after) a meal.
StorageStore Ambien® at controlled room temperature of 20°C to 25°C (68°F to 77°F). Store Ambien CR® at controlled room temperature of 15°C to 25°C (59°F to 77°F).
RestrictionsC-IV

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. The guide provides information about the appropriate use of zolpidem, and discusses concerns relating to "sleep-driving" and other activities of which the patient may have no recollection.

ContraindicationsHypersensitivity to zolpidem or any component of the formulation
Allergy Considerations

- Zolpidem Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal thinking/behavioral changes: Hypnotics/sedatives have been associated with abnormal thinking and behavior changes including decreased inhibition, aggression, bizarre behavior, agitation, hallucinations, and depersonalization. These changes may occur unpredictably and may indicate previously unrecognized psychiatric disorders; evaluate appropriately.

- CNS depression: May cause CNS depression impairing physical and mental capabilities; patients must be cautioned about performing tasks which require mental alertness (operating machinery or driving). Zolpidem should only be administered when the patient is able to stay in bed a full night (7-8 hours) before being active again.

- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.

- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted; amnesia may also occur. Discontinue treatment in patients who report a sleep-driving episode.

Disease-related concerns:

- Depression: Use with caution in patients with depression; worsening of depression, including suicide or suicidal ideation has been reported with the use of hypnotics. Intentional overdose may be an issue in this population. The minimum dose that will effectively treat the individual patient should be used. Prescriptions should be written for the smallest quantity consistent with good patient care.

- Drug abuse: Use with caution in patients with a history of drug dependence.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dose adjustment recommended.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Respiratory disease: Use with caution in patients with respiratory compromise, COPD, or sleep apnea.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Elderly: Use with caution in the elderly; dose adjustment recommended. Closely monitor elderly or debilitated patients for impaired cognitive or motor performance.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness.

- Rapid onset: Because of the rapid onset of action, administer immediately prior to bedtime or after the patient has gone to bed and is having difficulty falling asleep.

- Withdrawal: Abrupt discontinuance may lead to withdrawal symptoms.

Geriatric ConsiderationsIn doses >5 mg, there was subjective evidence of impaired sleep on the first post-treatment night. There have been few reports of increased hypotension and/or falls in the elderly with this drug. Can be considered a drug of choice in the elderly when a hypnotic is indicated. With Ambien CR®, the adverse event profile of 6.25 mg in elderly patients was similar to the 12.5 mg dose in younger adults. Until there is more experience with this dosage form, use with caution in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Children born of mothers taking sedative/hypnotics may be at risk for withdrawal; neonatal flaccidity has been reported in infants following maternal use of sedative/hypnotics during pregnancy.
LactationEnters breast milk/not recommended (AAP rates “compatible”)
Breast-Feeding Considerations0.004% to 0.019% of the maternal dose is found in breast milk.
Adverse ReactionsActual frequency may be dosage form, dose, and/or age dependent

>10%: Central nervous system: Dizziness, headache, somnolence

1% to 10%:

Cardiovascular: Blood pressure increased, chest discomfort/pain, palpitation

Central nervous system: Abnormal dreams, anxiety, apathy, amnesia, ataxia, attention disturbance, body temperature increased, confusion, depersonalization, depression, disinhibition, disorientation, drowsiness, drugged feeling, euphoria, fatigue, fever, hallucinations, hypoesthesia, insomnia, memory disorder, lethargy, lightheadedness, mood swings, sleep disorder, stress

Dermatologic: Rash, urticaria, wrinkling

Endocrine & metabolic: Menorrhagia

Gastrointestinal: Abdominal discomfort, abdominal pain, abdominal tenderness, appetite disorder, constipation, diarrhea, dyspepsia, flatulence, gastroenteritis, gastroesophageal reflux, hiccup, nausea, vomiting, xerostomia

Genitourinary: Urinary tract infection

Neuromuscular & skeletal: Arthralgia, back pain, balance disorder, myalgia, neck pain, paresthesia, psychomotor retardation, tremor, weakness

Ocular: Asthenopia, blurred vision, depth perception altered, diplopia, visual disturbance, red eye

Otic: Labyrinthitis, tinnitus, vertigo

Renal: Dysuria

Respiratory: Pharyngitis, sinusitis, upper respiratory tract infection, throat irritation

Miscellaneous: Allergy, binge eating, flu-like syndrome

<1% (Limited to important or life-threatening): Agitation, anorexia, arthritis, bronchitis, cerebrovascular disorder, cognition decreased, concentrating difficulty, constipation, cough, cystitis, diaphoresis, dysarthria, dysphagia, dyspnea, edema, emotional lability, eye irritation, falling, hepatic function abnormalities, hyperglycemia, hyper-/hypotension, illusion, leg cramps, menstrual disorder, nervousness, pallor, postural hypotension, pruritus, rhinitis, scleritis, somnambulism (sleepwalking), speech disorder, stupor, syncope, tachycardia, taste perversion, thirst, urinary incontinence, vaginitis

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Zolpidem. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Flumazenil: May diminish the sedative effect of Hypnotics (Nonbenzodiazepine). *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Zolpidem. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: May enhance the adverse/toxic effects of zolpidem; avoid use.

Food: Maximum plasma concentration and bioavailability are decreased with food; time to peak plasma concentration is increased; half-life remains unchanged. Grapefruit juice may decrease the metabolism of zolpidem.

Herb/Nutraceutical: St John's wort may decrease the levels/effects of zolpidem; avoid concomitant use. In addition, concomitant use of valerian, kava kava, and gotu kola should be avoided due to the risk of increased CNS depression.

Monitoring ParametersDaytime alertness; respiratory rate; behavior profile

Reference Range80-150 ng/mL

Nursing: Physical Assessment/MonitoringFor short-term use. Assess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. After long-term use, taper dosage slowly when discontinuing. Be alert to possibility of anaphylaxis any time during therapy. Monitor for CNS depression. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor for effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Take immediately before going to bed. Only use this medication if you can get a full night's sleep (at least 7-8 hours). Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, yogurt may help). Report CNS changes (confusion, memory problems, depression, increased sedation, excitation, headache, abnormal thinking or behavior, insomnia, or nightmares); muscle pain or weakness; respiratory difficulty; unusual swelling, especially on face or neck; chest pain or palpitations; or ineffectiveness of medication. Report episodes of "sleep driving" or other complex behaviors such as driving a vehicle, preparing food, or other activities which you have no memory of performing.
Pregnancy/breast-feeding precaution: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Product AvailabilityZolpimist® oral spray: FDA approved December, 2008; availability currently undetermined

Zolpimist® is an oral spray of zolpidem indicated for the short-term treatment of insomnia characterized by difficulties with sleep initiation.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as tartrate: 5 mg, 10 mg

Ambien®: 5 mg, 10 mg

Tablet, extended release, as tartrate:

Ambien CR®: 6.25 mg, 12.5 mg

Generic AvailableYes: Excludes extended release

ManufacturerSearle

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Ambien CR)

6.25 mg (30): $136.99

12.5 mg (30): $135.99

Tablets (Ambien)

5 mg (30): $159.13

10 mg (30): $159.13

Tablets (Zolpidem Tartrate)

5 mg (30): $17.99

10 mg (30): $17.99

Mechanism of ActionZolpidem, an imidazopyridine hypnotic that is structurally dissimilar to benzodiazepines, enhances the activity of the inhibitory neurotransmitter, γ-aminobutyric acid (GABA), via selective agonism at the benzodiazepine-1 (BZ$_1$) receptor; the result is increased chloride conductance, neuronal hyperpolarization, inhibition of the action potential, and a decrease in neuronal excitability leading to sedative and hypotic effects. Because of its selectivity for the BZ$_1$ receptor site over the BZ$_2$ receptor site, zolpidem exhibits minimal anxiolytic, myorelaxant, and anticonvulsant properties (effects largely attributed to agonism at the BZ$_2$ receptor site).

Pharmacodynamics/Kinetics

Onset of action: 30 minutes

Duration: 6-8 hours

Absorption: Rapid

Distribution: V$_d$: 0.54 L/kg

Protein binding: ~93%

Metabolism: Hepatic methylation and hydroxylation via CYP3A4 (~60%), CYP2C9 (~22%), CYP1A2 (~14%), CYP2D6 (~3%), and CYP2C19 (~3%) to three inactive metabolites

Bioavailability: 70%

Half-life elimination: ~2.5 hours (range 1.4-4.5 hours); Cirrhosis: Up to 9.9 hours; Elderly: prolonged up to 32%

Time to peak, plasma: 1.6 hours; 2.2 hours with food

Excretion: Urine (48% to 67%, primarily as metabolites); feces (29% to 42%, primarily as metabolites)

Related Information

- CMS: Long-Term Care Facility Thresholds
- Nonbenzodiazepine Anxiolytics and Hypnotics

Pharmacotherapy PearlsCauses fewer disturbances in sleep stages as compared to benzodiazepines. Time spent in sleep stages 3 and 4 are maintained; zolpidem decreases sleep latency; should not be prescribed in quantities exceeding a 1-month supply.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep. Zolpidem may be associated with a lower potential for abuse compared to benzodiazepines.

Anesthesia and Critical Care Concerns/Other ConsiderationsCauses fewer disturbances in sleep stages as compared to benzodiazepines. Time spent in sleep stages 3 and 4 are maintained; zolpidem decreases sleep latency; should not be prescribed in quantities exceeding a 1-month supply.

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Zonisamide may be confused with lacosamide

Pronunciation(zoe NIS a mide)
U.S. Brand NamesZonegran®
Canadian Brand NamesZonegran®
Pharmacologic CategoryAnticonvulsant, Miscellaneous
Use: Labeled IndicationsAdjunct treatment of partial seizures in children >16 years of age and adults with epilepsy
Use: Unlabeled/InvestigationalBipolar disorder
Dosing: Adults

Adjunctive treatment of partial seizures: Oral: Initial: 100 mg/day. Dose may be increased to 200 mg/day after 2 weeks. Further dosage increases to 300 mg and 400 mg/day can then be made with a minimum of 2 weeks between adjustments, in order to reach steady state at each dosage level. Doses of up to 600 mg/day have been studied, however, there is no evidence of increased response with doses >400 mg/day.

Mania (unlabeled use): Oral: Initial: 100-200 mg/day; maximum: 600 mg/day (Kanba, 1994)

Dosing: ElderlyData from clinical trials is insufficient for patients older than 65. Begin dosing at the low end of the dosing range.
Dosing: PediatricChildren >16 years: Refer to adult dosing.
Dosing: Renal ImpairmentSlower titration and frequent monitoring are indicated in patients with renal or hepatic disease. There is insufficient experience regarding dosing/toxicity in patients with estimated GFR <50 mL/minute. Marked renal impairment (Cl_{cr} <20 mL/minute) was associated with a 35% increase in AUC.
Dosing: Hepatic ImpairmentSlower titration and frequent monitoring are indicated.
Administration: OralCapsules should be swallowed whole. Dose may be administered once or twice daily. Doses of 300 mg/day and higher are associated with increased side effects. Steady-state levels are reached in 14 days.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at controlled room temperature 25°C (77°F). Protect from moisture and light.
ContraindicationsHypersensitivity to zonisamide, sulfonamides, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Significant CNS effects include psychiatric symptoms, psychomotor slowing, and fatigue or somnolence; fatigue and somnolence occur within the first month of treatment, most commonly at doses of 300-500 mg/day.

- Renal calculus: Discontinue therapy in patients who develop acute renal failure or a significant sustained increase in creatinine/BUN concentration; kidney stones have been reported.

- Sulfonamide reactions: Rare, but potentially fatal sulfonamide reactions have occurred following use. These reactions include Stevens-Johnson syndrome and toxic epidermal necrolysis, usually appearing within 2-16 weeks of drug initiation; discontinue if rash develops. Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age. Decreased sweating (oligohydrosis) and hyperthermia requiring hospitalization have been reported in children.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsConsider the CNS effects commonly experienced in the first month of therapy.
Pregnancy Risk FactorC
Pregnancy ConsiderationsFetal abnormalities and death have been reported in animals, however, there are no studies in pregnant women. Based on limited case reports, it appears zonisamide crosses the placenta. Use during pregnancy only if the potential benefits outweigh the potential risks.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsBased on limited case reports, it appears zonisamide is excreted in breast milk. Use during lactation only if the potential benefits outweigh the potential risks.
Adverse ReactionsAdjunctive therapy: Frequencies noted in patients receiving other anticonvulsants:
>10%:

Central nervous system: Somnolence (17%), dizziness (13%)

Gastrointestinal: Anorexia (13%)

1% to 10%:

Central nervous system: Headache (10%), agitation/irritability (9%), fatigue (8%), tiredness (7%), ataxia (6%), confusion (6%), concentration decreased (6%), memory impairment (6%), depression (6%), insomnia (6%), speech disorders (5%), mental slowing (4%), anxiety (3%), nervousness (2%), schizophrenic/schizophreniform behavior (2%), difficulty in verbal expression (2%), status epilepticus (1%), convulsion (1%), hyperesthesia (1%), incoordination (1%)

Dermatologic: Rash (3%), bruising (2%), pruritus (1%)

Gastrointestinal: Nausea (9%), abdominal pain (6%), diarrhea (5%), dyspepsia (3%), weight loss (3%), constipation (2%), dry mouth (2%), taste perversion (2%), vomiting (1%)

Neuromuscular & skeletal: Paresthesia (4%), abnormal gait (1%), tremor (1%), weakness (1%)

Ocular: Diplopia (6%), nystagmus (4%), amblyopia (1%)

Otic: Tinnitus (1%)

Respiratory: Rhinitis (2%), cough increased (1%), pharyngitis (1%)

Miscellaneous: Flu-like syndrome (4%), accidental injury (1%)

<1%: Abnormal dreams, acne, albuminuria, allergic reaction, alopecia, ALT increased, amenorrhea, anemia, apnea, arthralgia, arthritis, AST increased, atrial fibrillation, bladder calculus, bladder pain, bradycardia, cerebrovascular accident, chest pain, cholangitis, cholecystitis, cholelithiasis, cholestatic jaundice, circumoral paresthesia, colitis, conjunctivitis, deafness, dehydration, diaphoresis, dry skin, duodenitis, dysarthria, dyskinesia, dysphagia, dyspnea, dystonia, dysuria, eczema, edema, encephalopathy, enuresis, esophagitis, euphoria, facial edema, facial paralysis, fecal incontinence, flank pain, flatulence, gastritis, gastroduodenal ulcer, gastroenteritis, gingivitis, glaucoma, glossitis, gum hemorrhage, gum hyperplasia, gynecomastia, heart failure, hematemesis, hematuria, hemoptysis, hirsutism, hyper-/hypokinesia, hyper-/hypotension, hyper-/hypotonia, hypoglycemia, hyponatremia, immunodeficiency, impotence, iritis, lactic dehydrogenase increased, leg cramps, leukopenia, libido decreased, lupus erythematosus, lymphadenopathy, maculopapular rash, malaise, mastitis, melena, menorrhagia, microcytic anemia, mouth ulceration, movement disorder, myalgia, myasthenia, myoclonus, neck rigidity, neuropathy, nocturia, oculogyric crisis, palpitation, parosmia, peripheral edema, peripheral neuritis, petechia, photophobia, polyuria, pulmonary embolus, pustular rash, rectal hemorrhage, reflexes increased, stomatitis, syncope, tachycardia, thirst, thrombocytopenia, thrombophlebitis, twitching, ulcerative stomatitis, urinary frequency, urinary incontinence, urinary retention, urinary urgency, urticaria, vascular insufficiency, ventricular extrasystoles, vertigo, vesiculobullous rash, visual field defect, weight gain

Postmarketing and/or case reports: Agranulocytosis, aplastic anemia, BUN increased, hyperthermia, kidney stones, oligohydrosis, serum creatinine increased, serum alkaline phosphatase increased, Stevens-Johnson syndrome, suicidal behavior/ideation, toxic epidermal necrolysis

Metabolism/Transport Effects**Substrate** of CYP2C19 (minor), 3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Phenytoin: May increase the metabolism of Zonisamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food delays time to maximum concentration, but does not affect bioavailability.

Monitoring ParametersMonitor BUN and serum creatinine

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for increased risk of drug/drug interactions. Monitor therapeutic effectiveness, laboratory results, and adverse reactions at beginning of therapy and periodically with long-term use. Observe and teach seizure precautions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor BUN and serum creatinine

Patient EducationTake exactly as directed, as the same time each day, with or without food. Do not increase frequency, alter dose, or discontinue without consulting prescriber. If you miss a dose, take as soon as possible. If it is almost time for your next dose, skip the missed dose. Do not chew, crush, or open capsules; swallow whole. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid grapefruit juice while on this medication. While using this medication, avoid alcohol, herbal remedies, OTC or prescriptions drugs (especially pain medication, antihistamines, psychiatric medications, sedatives, or hypnotics) unless approved by your prescriber. Wear/carry identification of epileptic status and medications. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, constipation, dry mouth, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report CNS changes (changes in speech patterns, mentation changes, suicidal ideation, depression, changes in cognition or memory, unusual thought patterns, coordination difficulties, or excessive drowsiness); respiratory difficulty or tightening of the throat; swelling of mouth, lips, or tongue; muscle cramping, weakness, or pain; rash or skin irritations; unusual bruising or bleeding (mouth, urine, stool); fever, sore throat, sores in your mouth; swelling of extremities; sudden back pain, pain on urination, or dark/bloody urine (signs of kidney stones); or other adverse response including change in seizure type or frequency. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 25 mg, 50 mg, 100 mg

Zonegran®: 25 mg, 100 mg

Generic AvailableYes

ManufacturerElan Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Capsules (Zonegran)

25 mg (30): $31.19

100 mg (30): $89.43

Capsules (Zonisamide)

25 mg (100): $49.99

50 mg (100): $91.99

100 mg (30): $59.99

Mechanism of ActionThe exact mechanism of action is not known. May stabilize neuronal membranes and suppress neuronal hypersynchronization through action at sodium and calcium channels. Does not affect GABA activity.

Pharmacodynamics/Kinetics

Distribution: V_d: 1.45 L/kg

Protein binding: 40%

Metabolism: Hepatic via CYP3A4; forms N-acetyl zonisamide and 2-sulfamoylacetyl phenol (SMAP)

Half-life elimination: 63 hours

Time to peak: 2-6 hours

Excretion: Urine (62%, 35% as unchanged drug, 65% as metabolites); feces (3%)

Related Information

Zopiclone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ZOE pi clone)

Canadian Brand NamesApo-Zopiclone®; CO Zopiclone; Dom-Zopiclone; Gen-Zopiclone; Imovane®; Novo-Zopiclone; Nu-Zopiclone; PMS-Zopiclone; RAN™-Zopiclone; ratio-Zopiclone; Rhovane®; Rhoxal-zopiclone; Riva-Zopiclone; Sandoz-Zopiclone

Pharmacologic CategoryHypnotic, Nonbenzodiazepine

Use: Labeled IndicationsSymptomatic relief of transient and short-term insomnia

Use: DentalHas not been established

Dosing: Adults

Hypnotic: Oral: 5-7.5 mg just before retiring for the night

Patients with chronic respiratory insufficiency: 3.75 mg; may increase up to 7.5 mg with caution in appropriate cases

Dosing: ElderlyInitial: 3.75 mg just before retiring for the night; may increase to 5-7.5 mg

Dosing: Hepatic Impairment3.75 mg; may increase up to 7.5 mg with caution in appropriate cases

Administration: OralAdminister just before bedtime.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F) in a dry place. Protect from light.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to zopiclone or any component of the formulation; patients with severe respiratory impairment (eg, sleep apnea); pregnancy (similar agents)

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal thinking/behavioral changes: Hypnotics/sedatives have been associated with abnormal thinking and behavior changes including decreased inhibition, aggression, bizarre behavior, agitation, hallucinations, and depersonalization. These changes may occur unpredictably and may indicate previously unrecognized psychiatric disorders; evaluate appropriately.
- Amnesia: Can occur; do not take unless a full night's sleep and clearance of the drug from the body are possible.
- CNS depression: May cause CNS depression impairing physical and mental capabilities; patients must be cautioned about performing tasks which require mental alertness (operating machinery or driving).

Disease-related concerns:

- Depression: Use with caution in patients with depression; worsening of depression, including suicidal ideation, has been reported with the use of hypnotics. Intentional overdose may be an issue in this population; prescribe least amount of medication needed.
- Drug abuse: Use with caution in patients with a history of drug dependence.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.
- Respiratory disease: Use with caution in patients with respiratory compromise, COPD, or sleep apnea.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.
- CYP3A4 inhibitors: Use with caution in patients taking strong CYP3A4 inhibitors.

Special populations:

- Elderly: Use with caution in the elderly; more susceptible to adverse reactions (confusion).
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness.
- Duration of therapy: Should not be administered for more than 7-10 days consecutively.
- Rapid onset: Because of the rapid onset of action, administer immediately prior to bedtime or after the patient has gone to bed and is having difficulty falling asleep.
- Withdrawal: Abrupt discontinuance may lead to withdrawal symptoms.

Pregnancy Risk FactorNot assigned; similar agents rated D

Pregnancy ConsiderationsThere is insufficient data on safety in pregnancy; however, benzodiazepines may cause congenital malformations during the 1st trimester and neonatal CNS depression during the last few weeks of pregnancy; it is expected zopiclone may do the same.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsZopiclone is excreted in human milk and its concentration may reach 50% of plasma levels; therefore, it is not recommended to use while breast-feeding.

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation

Central nervous system: Agitation, anterograde amnesia, anxiety, asthenia, chills, confusion, depression, dizziness, drowsiness, euphoria, headache, hostility, memory impairment, nervousness, nightmares, somnolence, speech abnormalities

Dermatological: Rash, spots on skin

Endocrine & metabolic: Anorexia; libido decreased; alkaline phosphatase, ALT, and AST increased; appetite increased

Gastrointestinal: Constipation, coated tongue, diarrhea, dry mouth, dyspepsia, halitosis, nausea, taste alteration (bitter taste, common), vomiting

Neuromuscular & skeletal: Coordination impaired, hypotonia, limb heaviness, muscle spasms, paresthesia, tremor

Ocular: Amblyopia

Respiratory: Dyspnea

Miscellaneous: Diaphoresis

Metabolism/Transport Effects**Substrate** (major) of CYP2C9, 3A4

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Flumazenil: May diminish the sedative effect of Hypnotics (Nonbenzodiazepine). *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Macrolide Antibiotics: May increase the serum concentration of Zopiclone. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Effect/toxicity may be increased by grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersMonitor for confusion, excessive drowsiness (especially in elderly). Monitor patients with hepatic insufficiency closely.

Nursing: Physical Assessment/MonitoringFor inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions (see Adverse Reactions) at beginning of therapy and periodically with long-term use.

Patient EducationTake exactly as prescribed; do not change dose or take longer than prescribed without consulting prescriber. Do not take unless a full night's sleep is possible before you would need to be functional and active. Do not take with alcohol. Do not drive a car or operate dangerous machinery until you experience how the drug will affect you the next day. Zopiclone may cause drowsiness, dizziness, lightheadedness, and difficulty with coordination. If you experience unusual disturbing thoughts or behavior, notify your prescriber. You may experience an increase in sleep difficulties for 1-2 days after discontinuing. May cause dependence, especially when used regularly for more than a few weeks. You may experience withdrawal symptoms when discontinuing use. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 5 mg, 7.5 mg [not available in the U.S.]

> Apo-Zopiclone® [CAN], Gen-Zopiclone [CAN], Imovane® [CAN], Novo-Zopiclone [CAN], Nu-Zopiclone [CAN], PMS-Zopiclone [CAN], Rhovane® [CAN], Rhoxal-zopiclone [CAN]: 5 mg, 7.5 mg

Generic AvailableYes
ManufacturerAventis Pharma (Canada)
Mechanism of ActionZopiclone is a cyclopyrrolone derivative and has a pharmacological profile similar to benzodiazepines. Zopiclone reduces sleep latency, increases duration of sleep, and decreases the number of nocturnal awakenings.
Pharmacodynamics/Kinetics

Absorption: Elderly: 75% to 94%

Distribution: Rapidly from vascular compartment

Protein binding: ~45%

Metabolism: Extensively hepatic

Half-life elimination: 5 hours; Elderly: 7 hours; Hepatic impairment: 11.9 hours

Time to peak, serum: <2 hours; Hepatic impairment: 3.5 hours

Excretion: Urine (75%); feces (16%)

Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Coated tongue, dry mouth, halitosis, taste alteration (bitter taste, common).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Zoster Vaccine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Both varicella vaccine and zoster vaccine are live, attenuated strains of varicella-zoster virus. Their indications, dosing, and composition are distinct. Varicella vaccine is indicated for the prevention of chickenpox, while zoster vaccine is indicated in older individuals to prevent reactivation of the virus which causes shingles. Zoster vaccine is **not** a substitute for varicella vaccine and should not be used in children.

Pronunciation(ZOS ter vak SEEN)
U.S. Brand NamesZostavax®
Pharmacologic CategoryVaccine, Live (Viral)
Use: Labeled IndicationsPrevention of herpes zoster (shingles) in patients ≥60 years of age
The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination of all patients ≥60 years of age, including:

- Patients who report a previous episode of zoster.
- Patients with chronic medical conditions (eg, chronic renal failure, diabetes mellitus, rheumatoid arthritis, chronic pulmonary disease) unless those conditions are contraindications.
- Residents of nursing homes and other long-term care facilities ≥60 years of age, without contraindications.

Dosing: Adults**Shingles:** Adults ≥60 years: SubQ: 0.65 mL administered as a single dose; there is no data to support readministration of the vaccine
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment required.
Administration: I.V.Not for I.V. administration
Administration: OtherInject immediately after reconstitution. Inject SubQ into the deltoid region of the upper arm, if possible. In persons anticipating immunosuppression, give at least 14 days to 1 month prior to starting immunosuppressant.

Administration with chronic use of acyclovir, famciclovir, or valacyclovir: Discontinue ≥24 hours before administration of zoster vaccine. Do not use for ≥14 days after vaccination.

Administration with other vaccines:

Zoster vaccine with inactivated vaccines: May be given simultaneously or at any interval between doses

Zoster vaccine with other live vaccines:

Intranasal or injectable: If not given simultaneously, wait at least 4 weeks between administration

Oral: May be given simultaneously or at any interval between doses of live or inactivated injectable vaccines

Vaccine administration with antibody-containing products: Zoster vaccine may be given with blood or antibody-containing products. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

StorageDuring shipment, should be maintained at -15°C (5°F) or colder. Store powder in freezer at -15°C (5°F). Protect from light. Store diluent separately at room temperature or in refrigerator. Do not freeze reconstituted vaccine.
ReconstitutionWithdraw entire contents of the vial containing the provided diluent to reconstitute vaccine. Gently agitate to mix thoroughly. Withdraw entire contents of reconstituted vaccine vial for administration. Discard if reconstituted vaccine is not used within 30 minutes.
ContraindicationsHypersensitivity to any component of the vaccine; individuals with leukemia, lymphomas, or other malignant neoplasms affecting the bone marrow or lymphatic systems; primary and acquired immunodeficiency states including AIDS or clinical manifestations of HIV; those receiving immunosuppressive therapy (including high-dose corticosteroids); pregnancy

In addition, ACIP recommends that the following immunocompromised patients should not receive zoster vaccine:

Patients undergoing hematopoietic stem cell transplant (limited data; assess risk/benefit, if needed, administer ≥24 months after transplantation);

Patients receiving recombinant human immune modulators, particularly antitumor necrosis factor agents (eg, adalimumab, infliximab, etanercept). Safety and efficacy of concurrent administration is unknown and not recommended. Defer vaccination for ≥1 month after discontinuation.

Patients with unspecified cellular immunodeficiency (exception, patients with impaired humoral immunity may receive vaccine).

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness; may administer to patients with mild acute illness (with or without fever).

- Postherpetic neuropathy (PHN): Not for use in the treatment of PHN.

- Tuberculosis: Defer treatment in patients with active untreated tuberculosis.

- Zoster infection: Not for use in the treatment of active zoster outbreak. May be used in patients with previous history of zoster.

Concurrent drug therapy issues:

- Antiviral drugs: Medications active against the herpesvirus family (eg, acyclovir, famciclovir, valacyclovir) may interfere with the zoster vaccine.

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Not for use in patients <60 years of age.

- Altered immunocompetence: In patients where immunosuppressant therapy is anticipated, zoster vaccine should be given at least 14 days to 1 month prior to beginning therapy when possible Use is contraindicated in severely immunocompromised patients (eg, patients receiving chemo-/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids]); may have a reduced response to vaccination. Patients receiving corticosteroids in low-to-moderate doses, topical (inhaled, nasal, skin), local injection (intra-articular, bursal, tendon) may receive vaccine.

- Pediatrics: Zoster vaccine is not a substitute for varicella vaccine and should not be used in children.

- Varicella vaccine recipients: The ACIP does not recommend zoster vaccination in patients of any age who have received the varicella vaccine.

Dosage form specific warnings:

- Gelatin: Contains gelatin; do not use in patients with a history of anaphylactic/anaphylactoid reaction to gelatin.

- Neomycin sensitivity: Contains neomycin; do not use in patients with a history of anaphylactic/anaphylactoid reaction to neomycin. Contact dermatitis to neomycin is not a contraindication to the vaccine.

Other warnings/precautions:

- Transmission of virus: Vaccinated individuals do not need to take precautions against spreading varicella following vaccination; transmission of virus is rare unless rash develops. In case of rash, standard contact precautions should be followed.

Geriatric ConsiderationsThis vaccine is intended for those >60 years of age. This live attenuated vaccine should be used with caution in patients with neoplastic disease or those who are immunosuppressed.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Use during pregnancy is contraindicated. Although women of childbearing potential are unlikely to receive the vaccine, women should avoid becoming pregnant for 4 weeks after vaccination. Risk to the fetus following exposure to wild-type varicella zoster virus is small and risk following exposure from the attenuated vaccine is probably even less. Inadvertent exposure to the vaccine during pregnancy should be reported to Merck's National Service Center (800-986-8999).

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsMost live vaccines are not secreted into breast milk.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%: Local: Injection site reaction (48%; includes erythema, tenderness, swelling, hematoma, pruritus, and/or warmth)

1% to 10% (**Note:** Rates similar to placebo):

Central nervous system: Fever (2%), headache (1%)

Dermatologic: Skin disorder (1%)

Gastrointestinal: Diarrhea (2%)

Neuromuscular & skeletal: Weakness (1%)

Respiratory: Respiratory tract infection (2%), rhinitis (1%)

Miscellaneous: Flu-like syndrome (2%)

<1%, postmarketing, and/or case reports following varicella vaccine have included (not reported specifically following zoster vaccine): Anaphylaxis, ataxia, Bell's palsy, cellulitis, cerebrovascular accident, dizziness, encephalitis, erythema multiforme, Guillain-Barré syndrome, Henoch-Schönlein purpura, herpes zoster, impetigo, nonfebrile seizure, paresthesia, pharyngitis, pyrexia, rash (noninjection site), secondary skin infection, Stevens-Johnson syndrome, thrombocytopenia, transverse myelitis

Drug Interactions

Acyclovir-Valacyclovir: May diminish the therapeutic effect of Zoster Vaccine. Management: When possible, discontinue antiviral agents with anti-zoster activity (i.e., acyclovir, valacyclovir, famciclovir) for at least 24 hours prior to and 14 days after receiving a live attenuated zoster vaccine. *Risk X: Avoid combination*

Famciclovir: May diminish the therapeutic effect of Zoster Vaccine. Management: When possible, discontinue antiviral agents with anti-zoster activity (i.e., acyclovir, valacyclovir, famciclovir) for at least 24 hours prior to and 14 days after receiving a live attenuated zoster vaccine. *Risk X: Avoid combination*

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Monitoring ParametersFever, rash

Nursing: Physical Assessment/MonitoringThis is not a substitute for varicella vaccine; not for use in patients <60 years of age or in the treatment of active zoster outbreak. Assess patient history for contraindications prior to treatment. Deferring treatment should be considered in presence of acute illness or fever >101.3°F. Treatment for anaphylactic/anaphylactoid reaction should be immediately available during vaccine use. **Note:** All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS). Date of administration, name of manufacturer, lot number, and administering person’s name, title, and address should be recorded in patient’s permanent medical record. Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis vaccine is not a treatment for shingles, but may help prevent the occurrence of shingles or reduce the pain if shingles develops despite the vaccination. Avoid other vaccinations for 2 months following this vaccine unless approved by prescriber. Avoid close and/or prolonged contact with highly susceptible individuals (newborns, pregnant women, immunocompromised persons) for six weeks following vaccination; there is a rare risk of transmitting the vaccine virus to those who have not had chickenpox. Notify prescriber immediately of any acute reaction to vaccination (eg, difficulty breathing, chest pain, acute headache, rash, or difficulty swallowing). May cause mild fever and some redness, pain, or swelling at injection site; consult prescriber if excessive or persisting. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]

Zostavax®: 19,400 plaque-forming units (PFU) [contains gelatin, sucrose, and trace amounts of neomycin]

Generic AvailableNo

ManufacturerMerck & Co, Inc

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Zostavax)

19400 units/0.65 mL (1): $192.99

Mechanism of ActionAs a live, attenuated vaccine (Oka/Merck strain of varicella-zoster virus), zoster virus vaccine stimulates active immunity to disease caused by the varicella-zoster virus. Administration has been demonstrated to protect against the development of herpes zoster, with the highest efficacy in patients 60-69 years of age. It may also reduce the severity of complications, including postherpetic neuralgia, in patients who develop zoster following vaccination.

Pharmacodynamics/Kinetics

Onset of action: Seroconversion: ~6 weeks

Duration: Not established; protection has been demonstrated for at least 4 years

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

The varicella-zoster virus (VZV) is capable of causing two distinct manifestations of infection. Primary infection results in chickenpox (varicella). These infections tend to occur in young children or younger adults. Reactivation of latent infection (painful vesicular cutaneous eruption usually in a dermatomal pattern) occurs in older patients or in immunosuppressed populations. This is commonly referred to as shingles (herpes zoster). Although the vaccines are directed against the same causative organism, healthcare workers should be aware of differences in indications, dosing, populations, and composition of the vaccine. Neither vaccine is intended for administration during active outbreaks.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand Names Varilrix (PL)

Zuclopenthixol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(zoo kloe pen THIX ol)

Canadian Brand NamesClopixol-Acuphase®; Clopixol®; Clopixol® Depot

Pharmacologic CategoryAntipsychotic Agent, Typical

Use: Labeled IndicationsManagement of schizophrenia; acetate injection is intended for short-term acute treatment; decanoate injection is for long-term management; dihydrochloride tablets may be used in either phase

Use: Unlabeled/InvestigationalBipolar disorder, psychoses; agitated states

Dosing: Adults

Management of schizophrenia/psychoses:

Oral (zuclopenthixol dihydrochloride): Initial: 20-30 mg/day in 2-3 divided doses; usual maintenance dose: 20-40 mg/day; maximum daily dose: 100 mg

I.M. (short-term: zuclopenthixol acetate): 50-150 mg; may be repeated in 2-3 days; no more than 4 injections should be given in the course of treatment; maximum dose during course of treatment: 400 mg (maximum treatment period: 2 weeks)

Transfer of patients from I.M. acetate (Acuphase®) to oral (tablets):

50 mg = 20 mg daily

100 mg = 40 mg daily

150 mg = 60 mg daily

Long-term management; depot injection (zuclopenthixol decanoate): I.M.: 100 mg by deep I.M. injection; additional I.M. doses of 100-200 mg may be given over the following 1-4 weeks; maximum weekly dose: 600 mg; usual maintenance dose: 150-300 mg every 2 weeks

Transfer of patients from oral (tablets) to I.M. decanoate (depot):

≤20 mg daily = 100 mg every 2 weeks

25-40 mg daily = 200 mg every 2 weeks

50-75 mg daily = 300 mg every 2 weeks

>75 mg/day = 400 mg every 2 weeks

Transfer of patients from I.M. acetate (Acuphase®) to I.M. decanoate (depot):

50 mg every 2-3 days = 100 mg every 2 weeks

100 mg every 2-3 days = 200 mg every 2 weeks

150 mg every 2-3 days = 300 mg every 2 weeks

Dosing: ElderlyRefer to adult dosing.

StorageStore at 20°C to 25°C (68°F to 77°F); do not freeze. Protect all dosage forms from light. Acuphase® and depot injections may be mixed together in the same syringe. Clear or slightly yellow solutions may be used. Dispense in amber or opaque vials/bottles.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to zuclopenthixol, thioxanthenes, or any component of the formulation; acute intoxication (ethanol, barbiturate, or opioid); severe CNS depression; coma; suspected or established subcortical brain damage; circulatory collapse; blood dyscrasias; pheochromocytoma

Allergy Considerations

- Thioxanthene Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Avoid use in patients with underlying QT prolongation, in those taking medicines that prolong the QT interval, or cause polymorphic ventricular tachycardia; monitor ECG closely for dose-related QT effects. Adverse effects of decanoate may be prolonged.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, zuclopenthixol has a low potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms: May cause extrapyramidal symptoms (EPS), including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antispychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Zuclopenthixol is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage (subcortical-contraindicated), alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
LactationEnters breast milk/not recommended
Adverse Reactions

>10%:

Central nervous system: Somnolence/drowsiness (32%), anxiety/nervousness (17%), insomnia (16%), akathisia (14%), extrapyramidal effects (13%), dizziness (11%)

Gastrointestinal: Xerostomia (15%)

Endocrine & metabolic: Libido decreased (3%), menstrual disorder (2%)

Neuromuscular & skeletal: Hypertonia (19%), tremor (19%), weakness (15%)

1% to 10%:

Central nervous system: Agitation (10%), depression (8%), concentration impaired (8%), headache (5%), vertigo (5%), dystonia (5%), tardive dyskinesia (3%), paresthesia (1%), hallucination (3%), apathy (3%), confusion (3%), amnesia (3%), abnormal dreams (2%)

Dermatologic: Seborrhea (2%), pruritus (up to 2%)

Gastrointestinal: Constipation (8%), salivation increased (8%), anorexia (4%), vomiting (3%), nausea (2%)

Genitourinary: Micturition disorder (3%)

Neuromuscular & skeletal: Hypokinesia (8%), abnormal gait (2%), myalgia (1%)

Ocular: Abnormal accommodation (6%), abnormal vision (4%)

Miscellaneous: Diaphoresis increased (3%)

<1% (Limited to important or life-threatening): Abdominal pain, agranulocytosis, allergic reaction, anorgasmia, apnea, ataxia, chest pain, corneal deposits, dysphagia, dyspnea, dyskinesia, erectile dysfunction, galactorrhea, glossitis, gynecomastia, hypotension, migraine, oculogyric crisis, neuroleptic malignant syndrome (NMS), paroniria, photosensitivity, purpura, rash, respiratory depression, seizure, speech disorder, tinnitus

Metabolism/Transport Effects**Substrate** of CYP2D6 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Reference RangeTherapeutic z-clopenthixol serum levels are 2-12 ng/mL; ingestion of 2.5 g resulted in a peak blood level of 900 ng/mL

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, as acetate:

Clopixol Acuphase® [CAN]: 50 mg/mL [zuclopenthixol 42.5 mg/mL] (1 mL, 2 mL) [not available in the U.S.]

Injection, as decanoate:

Clopixol® Depot [CAN]: 200 mg/mL [zuclopenthixol 144.4 mg/mL] (10 mL) [not available in the U.S.]

Tablet, as dihydrochloride:

Clopixol® [CAN]: 10 mg, 25 mg, 40 mg [not available in the U.S.]

Generic AvailableNo
ManufacturerLundbeck (Canada)
Mechanism of ActionZuclopenthixol is a thioxanthene antipsychotic with a piperazine side chain; related to fluphenazine, the cis(z)-clopenthixol is the active isomer of this neuroleptic; blocks postsynaptic dopaminergic brain receptors.
Pharmacodynamics/Kinetics

Onset of action: Acetate injection: Sedation within 2 hours

Duration: Acetate injection: 2-3 days; Decanoate injection: 2 weeks

Distribution: V_d: 15-20 L/kg

Metabolism: Hepatic via N-dealkylation

Half-life elimination: Terminal: Oral: 20 hours; Depot: 19 days

Time to peak: Acetate injection: 24-36 hours; Dihydrochloride tablet: 3 hours; Depot: 3-7 days

Related Information

- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsZuclopenthixol is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.
Mental Health CommentOlder antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Index TermsZ-chlopenthixol; Zuclopenthixol Acetate; Zuclopenthixol Decanoate; Zuclopenthixol Dihydrochloride
